# STRONGLY ROBUSTNESS OF TORIC IDEALS OF WEIGHTED ORIENTED CYCLES SHARING A SINGLE VERTEX 

RAMAKRISHNA NANDURI* AND TAPAS KUMAR ROY ${ }^{\dagger}$

#### Abstract

In this article, we study the strongly robust property of toric ideals of weighted oriented graphs. Let $D$ be a weighted oriented graph consists of weighted oriented cycles (balanced or unbalanced) sharing a single vertex $v$ and $D^{\prime}$ be a weighted oriented graph consists of $D$ and a finite number of disjoint cycles such that each of these cycles is connected by a path at the sharing vertex $v$ of $D$. Then we show that the toric ideals $I_{D}, I_{D^{\prime}}$ of $D$ and $D^{\prime}$ respectively, are strongly robust and hence robust. That is, for the toric ideal $I_{D}$, of $D$, its Graver basis is a minimal generating set of $I_{D}$. We explicitly give a unique minimal generating set of primitive binomials of $I_{D}$. We explicitly describe the circuit binomials in any weighted oriented graph.

## 1. Introduction

Toric ideals are important in the modern theory of Algebra and impacted within a variety of research areas including Commutative Algebra, Algebraic Geometry, Combinatorial Optimization and Algebraic Coding Theory (see [23], [28, Chapter 8], [21]). For any $n \times m$ matrix $A=\left[\mathbf{a}_{\mathbf{1}} \ldots \mathbf{a}_{\mathbf{m}}\right]$ with non-negative integers, let $M=\left(\mathbf{x}^{\mathbf{a}_{1}}, \ldots, \mathbf{x}^{\mathbf{a}_{\mathbf{m}}}\right)$ be the monomial ideal in $R=K\left[x_{1}, \ldots, x_{n}\right]$, where $K$ is a field. Let $S=K\left[e_{1}, \ldots, e_{m}\right]$ be a polynomial ring the variables $e_{1}, \ldots, e_{m}$. Define a ring homomorphism $\varphi: S \rightarrow R$, as $\varphi\left(e_{i}\right)=\mathbf{x}^{\mathbf{a}_{\mathbf{i}}}$. Then the kernel of $\varphi$ is called the toric ideal associated to $A$ or $M$ and we denote by $I_{A}$. Note that $S / I_{A}$ is the affine semigroup ring corresponding to the semigroup $\mathbb{Z}_{+} \mathbf{a}_{\mathbf{1}}+\cdots+\mathbb{Z}_{+} \mathbf{a}_{\mathrm{m}}$. It is well known that $I_{A}$ is a prime ideal generated by binomials $\mathbf{e}^{\mathbf{u}}-\mathbf{e}^{\mathbf{v}}$ such that $\operatorname{deg}_{A}\left(\mathbf{e}^{\mathbf{u}}\right)=\operatorname{deg}_{A}\left(\mathbf{e}^{\mathbf{v}}\right)$, where $\operatorname{deg}_{A}\left(\mathbf{e}^{\mathbf{u}}\right)=u_{1} \mathbf{a}_{\mathbf{1}}+\cdots+u_{n} \mathbf{a}_{\mathbf{n}}$.

A binomial $\mathbf{e}^{\mathbf{u}}-\mathbf{e}^{\mathbf{v}}$ in $I_{A}$ is called a primitive binomial if there exists no other binomial $\mathbf{e}^{\mathbf{u}^{\prime}}-\mathbf{e}^{\mathbf{v}^{\prime}}$ in $I_{A}$ such that $\mathbf{e}^{\mathbf{u}^{\prime}} \mid \mathbf{e}^{\mathbf{u}}$ and $\mathbf{e}^{\mathbf{v}^{\prime}} \mid \mathbf{e}^{\mathbf{v}}$. The set of primitive binomials in $I_{A}$ is called the Graver basis of $I_{A}$ and denoted by $G r_{A}$. Minimal system of binomial generators of

[^0]toric ideals have been studied by many authors (see [23], [4]). It is a demanding problem in Algebraic Statistics, when toric ideals have unique minimal system of binomial generators (see [26]). To study this problem many authors defined various notions of binomial generators of toric ideals. In [4], an explicit combinatorial formula for the number of minimal systems of binomial generators of toric ideals was given. The notion of robustness of toric ideals has been studied in several papers. A toric ideal $I_{A}$ is said to be robust if it is minimally generated by its universal Gröbner basis. The universal Gröbner basis of $I_{A}$ is denoted by $\mathcal{U}_{A}$ and is defined as the union of all reduced Gröbner bases of $I_{A}$ with respect to all possible term orders. The robust toric ideals have been studied in [1] for simple graphs, in [3] for toric ideals generated by quadratic binomials, and in [7] for toric graph ideals generated by binomials. Nevertheless, robustness is a rare property and in literature we know few nontrivial examples of robust ideals, see [3, 7]. A weaker version of robust ideals known as generalized robust ideals have been studied (see [25]). A toric ideal $I_{A}$ is said to be generalized robust if its universal Gröbner basis $\mathcal{U}_{A}$ is equal to its universal Markov basis. A Markov basis of $I_{A}$ is a minimal binomial generating set of $I_{A}$ and the universal Markov basis of $I_{A}$ is the union of all its minimal sets of binomial generators and we denote by $\mathcal{M}_{A}$. A toric ideal is said to be strongly robust if its Graver basis equals the union of all minimal sets of binomial generators $\mathcal{M}_{A}$ of $I_{A}$, equivalently, $G r_{A}$ equals the set of all indispensable binomials of $I_{A}$. A binomial $f=\mathbf{e}^{\mathbf{u}}-\mathbf{e}^{\mathbf{v}}$ in $I_{A}$ is called indispensable if every system of binomial generators of $I_{A}$ contains $f$ or $-f$. Generalized robust toric ideals have been studied in [24] for codimension 2 toric ideals, and in [25] for toric ideals of simple graphs. In fact, the notions robust and strongly robust are coincide for toric ideals of simple graphs (see [25]). See [22, 24, 11] for some family of strongly robust toric ideals. In this work we study the minimal systems of binomial generators of toric ideals weighted oriented graphs. In particular, we study when such toric ideals have unique minimal set of binomial generators. Nevertheless, the notions of robust, generalized robust and strongly robust properties of toric ideals of weighted oriented graphs are completely unknown. However the toric ideals of edge ideals of simple graphs (simply we call as toric graph ideals) are broadly studied and many algebraic and combinatorial properties and characterizations of such ideal are explored enough in the literature (see [17, 18, 27, 15, 12]).

A weighted oriented graph $D$ (shortly we write as WOG) is a multiple object $D=$ $(V(D), E(D), w)$, where $V(D)=\left\{x_{1}, \ldots, x_{n}\right\}$ is the (finite) set of vertices of $D, E(D)$ is
the set of edges of $D$ (without multiple edges nor loops),

$$
E(D)=\left\{\left(x_{i}, x_{j}\right): \text { there is an edge from } x_{i} \text { to } x_{j}\right\}
$$

and $w$ is a weight function $w: V(D) \rightarrow \mathbb{N}$, which puts a weight to each vertex of $D$. That is, each edge is specified a orientation and each vertex is given a weight. WOGs are significant because of their uses in various research fields (see for example [13, [5, 8, , 19, 29, 9, 10]. The edge ideal of $D$ is defined as the ideal in $R, I(D)=\left(x_{i} x_{j}^{w_{j}}:\left(x_{i}, x_{j}\right) \in E(D)\right)$. The toric ideal of $I(D)$, simply we write as $I_{D}$, is the toric ideal corresponding to the incidence matrix $A(D)$ (see Definition 2.1) of $D$. We call $I_{D}$, the toric ideal of $D$. The toric ideal $I_{D}$ has been studied in [2] and showed when it is principal and also they summarized the complexity about unhampered number of generators (or their exponents) for weighted oriented cycles (balanced or unbalanced or odd) sharing a vertex. Recently, in [16], the authors give an explicit formulas for the generators of toric ideals of any number of balanced cycles sharing a vertex and toric ideals of any two weighted oriented cycles (balanced or unbalanced or odd) sharing a vertex. Let $\mathcal{M}_{D}, \mathcal{U}_{D}, G r_{D}$ denote the universal Markov basis, universal Gröbner basis and Graver basis of $I_{D}$ respectively. A binomial $\mathbf{e}^{\mathbf{u}}-\mathbf{e}^{\mathbf{v}}$ in $I_{A}$ is called a circuit of $I_{D}$ if it has minimal support with respect to set inclusion. The set of circuits of $I_{D}$ is denoted by $\mathcal{C}_{D}$. Moreover it is known that

$$
\mathcal{C}_{D} \subseteq \mathcal{U}_{D} \subseteq G r_{D} \text { and } \mathcal{M}_{D} \subseteq G r_{D}
$$

If $D$ is a WOG of any number of balanced cycles sharing a vertex, then by [16, Theorem 3.1], we have that $I_{D}$ is a circuit ideal, that is $I_{D}$ is generated by $\mathcal{C}_{D}$ and hence it is strongly robust and robust as well. Nevertheless the toric ideal of any two oriented cycles (balanced or unbalanced or odd) is principal and whose generator is explicitly computed (see [16]). Thus the first nontrivial class of $D$ to study the robustness of $I_{D}$ is three oriented cycles sharing a vertex.

In this work, our aim is to study strongly robustness of toric ideals of WOGs. We show that the toric ideals of a WOG $D$ of finite oriented cycles sharing a vertex, and a WOG $D^{\prime}$ consists of above $D$ and a finite number of disjoint cycles such that each of these cycles is connected by a path at the sharing vertex of cycles of $D$, are strongly robust (Theorems 3.11, 3.12). We explicitly compute the unique minimal generating set $M_{D}$ consists of primitive binomials, of the toric ideal $I_{D}$ of $D$ consists of three oriented cycles (balanced or unbalanced or odd) sharing a common vertex (see Theorems 3.13, 3.15, 3.16,
3.17). That is, $M_{D}=\mathcal{U}_{D}=G r_{D}$. We characterize the circuit binomials in any WOG (see Proposition 4.2). If a WOG $D$ consists of finitely many oriented cycles sharing a vertex such that at most two among these cycles are unbalanced, then we show that $\mathcal{C}_{D}$ is a generating set of $I_{D}$ and hence $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$ (see Propositions 4.3, 4.4, 4.5. 4.6). We characterize primitive binomials of a WOG consists of $n$ unbalanced cycles sharing a vertex. Further if $D$ is a WOG of finitely many oriented cycles sharing a common vertex, then we describe primitive binomials in $I_{D}$ (Theorem 4.8). Unlike the case of two oriented cycles sharing a vertex, $I_{D}$ can have many minimal binomial generators whose support is $E(D)$. For robust toric ideals $I_{D}$, we have that the multigraded Betti numbers of $I_{D}$ and $\operatorname{in}_{<}\left(I_{D}\right)$ are equal, for any term order $<$. By using our main results, we give some interesting applications to the case that $V^{+}$are sink vertices. If $D$ consists of $n$ unbalanced (even or odd) cycles, then we show that $I_{D}=I_{G}$, if $V^{+}$are sink vertices (Proposition 4.14) or each vertex of $D$ is either a source or a sink vertex (Proposition 4.7). We observe some class of non-trivial graphs where $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$ (see 4.9, 4.11).

We constructed the paper as follows. In the section 2, we recall the definitions and some results needed for the rest of the paper. In the section 3, first we characterized WOGs $D$ whose toric ideal $I_{D}$ is generic (Theorem 3.2). We show that $I_{D}$ is strongly robust, if $D$ is a WOG of three oriented cycles sharing a vertex by explicitly giving a unique minimal generating set of primitive binomials of $I_{D}$. Let $D$ be a WOG consists of weighted oriented cycles (balanced or unbalanced) sharing a single vertex $v$ and $D^{\prime}$ be a weighted oriented graph consists of $D$ and a finite number of disjoint cycles such that each of these cycles is connected by a path at the sharing vertex $v$ of $D$. Then we show that the toric ideals $I_{D}, I_{D^{\prime}}$ of $D$ and $D^{\prime}$ respectively, are strongly robust. In the section 4, we characterize circuit binomials in any WOG and we showed some WOGs which are generated by circuit binomials. Finally, we describe primitive binomials in a WOG consists of finitely many unbalanced cycles.

## 2. Preliminaries

Let $R=K\left[x_{1}, \ldots, x_{n}\right]$, where $K$ is a field. Recall that the support of a binomial $f=\prod_{k=1}^{m} e_{k}^{p_{k}}-\prod_{k=1}^{m} e_{k}^{q_{k}}$, denoted as $\operatorname{supp}(f)$, is the set of variables $e_{k}$ which appear in $f$ with non-zero exponent. Also, support of a vector $\mathbf{a} \in \mathbb{Z}_{+}^{n}$, is defined as $\operatorname{supp}(\mathbf{a}):=\left\{i: a_{i} \neq 0\right\}$.

A (vertex) weighted oriented graph is a triplet $D=(V(D), E(D)$, w), where $V(D)=$ $\left\{x_{1}, \ldots, x_{n}\right\}$ is the vertex set of $D$,

$$
E(D)=\left\{\left(x_{i}, x_{j}\right): \text { there is an edge from } x_{i} \text { to } x_{j}\right\}
$$

is the edge set of $D$ and the weight function $\mathbf{w}: V(D) \rightarrow \mathbb{N}$. We simply denote the weight function $\mathbf{w}$ by the vector $\mathbf{w}=\left(w_{1}, \ldots, w_{n}\right)$, where $w_{j}=w\left(x_{j}\right)$ for each $j$. If $e=\left(x_{i}, x_{j}\right)$ is an edge of $D$, then we call $x_{j}$ as head of $e$ and $x_{i}$ is called tail of $e$. The indegree of $v_{i}$ is defined as $\left|\left\{v_{j} \in V(D):\left(v_{j}, v_{i}\right) \in E(D)\right\}\right|$ and the outdegree of $v_{i}$ is defined as $\left|\left\{v_{j} \in V(D):\left(v_{i}, v_{j}\right) \in E(D)\right\}\right|$. The edge ideal of $D$ is defined as the ideal

$$
I(D)=\left(x_{i} x_{j}^{w_{j}}:\left(x_{i}, x_{j}\right) \in E(D)\right)
$$

in $R$. Let $V(D)=\left\{x_{1}, \ldots, x_{n}\right\}$ and $E(D)=\left\{e_{1}, \ldots, e_{m}\right\}$.
Definition 2.1. The incidence matrix of $D$ is an $n \times m$ matrix whose $(i, j)^{\text {th }}$ entry $a_{i, j}$ is defined by

$$
a_{i, j}=\left\{\begin{array}{l}
1 \text { if } e_{j}=\left(x_{i}, x_{l}\right) \in E(D) \text { for some } 1 \leq l \leq n \\
w_{i} \text { if } e_{j}=\left(x_{l}, x_{i}\right) \in E(D) \text { for some } 1 \leq l \leq n \\
0 \text { otherwise, }
\end{array}\right.
$$

and we denote by $A(D)$.
The toric ideal of $D$ is defined as the toric ideal of the incidence matrix $A(D)$ or the edge ideal $I(D)$ and we shortly denote as $I_{D}$. A weighted oriented $r$-cycle denoted by $\mathcal{C}_{r}$ is a weighted oriented graph whose underlying graph is a cycle of length $r$ and the edges oriented in any direction (need not be naturally oriented). Recall that a weighted oriented even cycle $\mathcal{C}_{m}$ on $m$ vertices is said to be balanced if $\prod_{k=1}^{m} a_{k, k}=a_{1, m} \prod_{k=1}^{m} a_{k+1, k}$, where $A\left(\mathcal{C}_{m}\right)=\left[a_{i, j}\right]_{m \times m}$. We denote $\operatorname{Null}(A(D))$, the null space of $A(D)$ over $\mathbb{Q}$.

A weighted oriented cycle is called naturally oriented if edges are either oriented in clockwise direction or in anti-clockwise direction.

Definition 2.2. For a vector $\mathbf{b}=\left((-1)^{p_{1}} b_{1},(-1)^{p_{2}} b_{2}, \ldots,(-1)^{p_{l}} b_{l}\right) \in \mathbb{Z}^{l}$, with $p_{i} \geq 1, b_{i} \geq$ 0 integers, define the corresponding binomial in the variables $e_{1}, \ldots, e_{l}$ as $f_{\mathbf{b}}:=f_{\mathbf{b}}^{+}-f_{\mathbf{b}}^{-}$, where

$$
f_{\mathbf{b}}^{+}=\prod_{i=1}^{l} e_{\left(p_{i} \text { even }\right)}^{b_{i}}, \text { and } f_{\mathbf{b}}^{-}=\prod_{i=1\left(p_{i} \text { odd }\right)}^{l} e_{i}^{b_{i}} .
$$

For any vector $\mathbf{b} \in \mathbb{Z}^{l}$, we can always write $\mathbf{b}=\mathbf{b}_{+}-\mathbf{b}_{-}$uniquely, where $\mathbf{b}_{+}, \mathbf{b}_{-} \in \mathbb{Z}_{+}^{l}$. Note that $f_{\mathbf{m}}^{+}=\mathbf{e}^{\mathbf{m}_{+}}$and $f_{\mathbf{m}}^{-}=\mathbf{e}^{\mathbf{m}_{-}}$.

Definition 2.3. For $\mathbf{a}, \mathbf{b} \in \mathbb{Z}^{l}$, we define $\mathbf{a} \prec \mathbf{b}$, if $\operatorname{supp}\left(\mathbf{a}_{+}\right) \subseteq \operatorname{supp}\left(\mathbf{b}_{+}\right)$and $\operatorname{supp}\left(\mathbf{a}_{-}\right) \subseteq$ $\operatorname{supp}\left(\mathbf{b}_{-}\right)$. For binomials $f_{\mathbf{a}}, f_{\mathbf{b}}$, we define $f_{\mathbf{a}} \prec f_{\mathbf{b}}$. if $\mathbf{a} \prec \mathbf{b}$, equivalently, $\operatorname{supp}\left(f_{\mathbf{a}}^{+}\right) \subseteq$ $\operatorname{supp}\left(f_{\mathbf{b}}^{+}\right)$and $\operatorname{supp}\left(f_{\mathbf{a}}^{-}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{b}}^{-}\right)$.

Let $[\mathbf{b}]_{i}$ denotes the $i$-th entry of $\mathbf{b}$. Also, $f_{\mathbf{m}} \in I_{D}$ implies that $\mathbf{m} \in \operatorname{Null}(A(D))$ and $[\mathbf{m}]_{i}$ denotes the $i$-th entry of $\mathbf{m}$ corresponding to the edge $e_{i} \in E(D)$. For any $S \subseteq\{1, \ldots, l\}$ and $\mathbf{a} \in \mathbb{Z}^{l}$, we denote $\left.\mathbf{a}\right|_{S}$ be the vector in $\mathbb{Z}^{|S|}$ such that $\left[\left.\mathbf{a}\right|_{S}\right]_{i}=[\mathbf{a}]_{i}$ for all $i \in S$. Throughout we use minimal element in $\mathbb{Z}^{2}$, with respect to the following partial order: $(a, b) \leq(c, d)$, if $a \leq c$ and $b \leq d$.

Theorem 2.4. [2, Theorem 5.1]. Let $D$ be weighted oriented graph consists of two unbalanced cycles share a vertex. Then $I_{D}$ is a principal ideal.

Lemma 2.5. Let $\mathbf{a}=\left((-1)^{p_{i}} a_{i}\right)_{i=1}^{l}, \mathbf{b}=\left((-1)^{q_{i}} b_{i}\right)_{i=1}^{l} \in \mathbb{Z}^{l}$, where $p_{i}, q_{i} \in \mathbb{N}, a_{i}, b_{i} \in$ $\mathbb{N} \cup\{0\}$ such that $\operatorname{supp}(\mathbf{a}) \cap \operatorname{supp}(\mathbf{b})=\left\{z_{1}, z_{2}, \ldots, z_{l_{1}}\right\}=S$. Let $\lambda_{1}, \lambda_{2} \in \mathbb{N}$.
(i) $f_{\lambda_{1} \mathbf{a}} \in\left(f_{\mathbf{a}}\right)$.
(ii) Suppose $(-1)^{p_{z_{i}}}=(-1)^{q_{z_{i}}}$ for each $i \in\left\{1,2, \ldots, l_{1}\right\}$. Then $f_{\lambda_{1} \mathbf{a}+\lambda_{2} \mathbf{b}} \in\left(f_{\mathbf{a}}, f_{\mathbf{b}}\right)$.

Proof. (i) $f_{\lambda_{1} \mathbf{a}}=\left(f_{\mathbf{a}}^{+}\right)^{\lambda_{1}}-\left(f_{\mathbf{a}}^{-}\right)^{\lambda_{1}}=\left(f_{\mathbf{a}}^{+}-f_{\mathbf{a}}^{-}\right) h_{1}=f_{\mathbf{a}} h_{1}$ for some polynomial $h_{1}$. Thus $f_{\lambda_{1} \mathbf{a}} \in\left(f_{\mathbf{a}}\right)$.
(ii) We have $f_{\lambda_{1} \mathbf{a}+\lambda_{2} \mathbf{b}}=f_{\lambda_{1} \mathbf{a}} f_{\lambda_{2} \mathbf{b}}^{+}+f_{\lambda_{1} \mathbf{a}}^{-} f_{\lambda_{2} \mathbf{b}} \in\left(f_{\mathbf{a}}, f_{\mathbf{b}}\right)$ as $f_{\lambda_{1} \mathbf{a}}, f_{\lambda_{2} \mathbf{b}}$ are multiples of $f_{\mathbf{a}}, f_{\mathbf{b}}$ respectively.

Below proposition is graph version of [23, Proposition 4.13]. Note that $A(H)$ is a matrix obtained from $A(D)$ by deleting some columns.

Proposition 2.6. Let $H$ be a oriented subgraph of a weighted oriented graph $D$ such that $V(D)=V(H)$. Then
(i) $I_{H}=I_{D} \cap K\left[e_{i}: e_{i} \in E(H)\right]$,
(ii) $\mathcal{C}_{H}=\mathcal{C}_{D} \cap K\left[e_{i}: e_{i} \in E(H)\right]$,
(iii) $\mathcal{U}_{H}=\mathcal{U}_{D} \cap K\left[e_{i}: e_{i} \in E(H)\right]$,
(iv) $G r_{H}=G r_{D} \cap K\left[e_{i}: e_{i} \in E(H)\right]$.

Below we prove a lemma which we use in many proofs.

Lemma 2.7. Let $D$ be any weighted oriented graph and $f_{\mathbf{m}} \neq 0 \in I_{D}$. Let $v \in V(D)$ of degree $n$. If $(n-1)$ edges of $D$ incident with $v$ are not in $\operatorname{supp}\left(f_{\mathbf{m}}\right)$, then the other edge incident with $v$ is not in $\operatorname{supp}\left(f_{\mathbf{m}}\right)$. Moreover if the edge $e_{i}$ incident with $v$ belongs to $\operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)\left(\operatorname{or} \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)\right)$, then there exists an edge $e_{j}$ incident with $v$ belongs to $\operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)\left(\operatorname{or} \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)\right)$.

Proof. Note that $\mathbf{m} \in \operatorname{Null}(A(D))$. Let $e_{1}, e_{2}, \ldots, e_{n}$ be the edges precisely incident with $v$. Suppose $e_{1}, e_{2}, \ldots, e_{i-1}, e_{i+1}, \ldots, e_{n} \notin \operatorname{supp}\left(f_{\mathbf{m}}\right)$. Then $[\mathbf{m}]_{k}=0$ for $k=1,2, \ldots, i-$ $1, i+1, \ldots, n$. Then from the equation $A(D) \mathbf{m}=\mathbf{0}$, we get that $[\mathbf{m}]_{i}=0$. This implies that $e_{i} \notin \operatorname{supp}\left(f_{\mathbf{m}}\right)$, as required.

Suppose $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)\left(\right.$or $\left.\in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)\right)$. Then $[\mathbf{m}]_{i}>0\left(\right.$ or $\left.[\mathbf{m}]_{i}<0\right)$. From the equation $A(D) \mathbf{m}=\mathbf{0}$, we get $\sum_{k=1}^{i-1}[\mathbf{m}]_{k} x_{k}+[\mathbf{m}]_{i} x_{i}+\sum_{k=i+1}^{n}[\mathbf{m}]_{k} x_{k}=0$ for some positive integers $x_{k}$ 's. This implies that there exists $j$ such that $[\mathbf{m}]_{j}<0$ (or $\left.[\mathbf{m}]_{j}>0\right)$. Thus $e_{j} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)\left(\right.$or $\left.\operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)\right)$.

## 3. Strongly robustness of toric ideal of three unbalanced cycles SHARING A VERTEX

In this section, first we characterize WOGs $D$ those toric ideal $I_{D}$ is generic. We show that the toric ideals of a WOG $D$ of finite oriented cycles sharing a vertex, and a WOG $D^{\prime}$ consists of above $D$ and a finite number of disjoint cycles such that each of these cycles is connected by a path at the sharing vertex of cycles of $D$, are strongly robust and the toric ideals have unique minimal generating sets (by [25, Theorem 5.10]) consists of primitive binomials. We explicitly compute this minimal generating set of $I_{D}$ if $D$ is a WOG of three oriented cycles (even or odd or balanced or unbalanced) sharing a vertex.

Definition 3.1. [20] Let $D$ be weighted oriented graph and $E(D)$ be its edge set. Then the toric ideal $I_{D}$ is called generic if $\operatorname{supp}(f)=E(D)$, for all $f \in M_{D}$.

Theorem 3.2. The toric ideal $I_{D}$ of a weighted oriented graph $D$ is generic if and only if $D$ is one of below type graphs:
(i) $D$ is a balanced cycle.
(ii) $D$ consists of precisely two unbalanced cycles share a vertex.
(iii) $D$ consists of precisely two unbalanced cycles $\mathcal{C}_{1}, \mathcal{C}_{2}$ share a path $P$ such that the induced cycle $D \backslash(P \backslash$ end points of $P)$ is unbalanced.
(iv) $D$ consists of precisely two unbalanced cycles connected by a path.

Proof. Suppose $I_{D}$ is generic. Then $D$ cannot have any leaf vertices because edge incident with leaf cannot appear in any element of minimal generating set of $I_{D}$. Since $I_{D} \neq(0)$, $D$ is not an unbalanced cycle. Suppose $D$ is none of above type required graphs. Then either $D$ has an proper balanced cycle or $D$ has no proper balanced cycles.
Case-1: Suppose $D$ has an proper balanced cycle $\mathcal{C}$. If $f_{\mathrm{c}}$ is not indispensable, then there exists a balanced cycle $\mathcal{C}_{1}$ in $D$ such that $f_{\mathbf{c}_{1}}^{+} \mid f_{\mathbf{c}}^{+}$and there is another cycle $\mathcal{C}_{2}$ in $D$ where $\mathcal{C}_{1}, \mathcal{C}_{2}$ share an edge $e$ and $E(\mathcal{C})=\left(E\left(\mathcal{C}_{1}\right) \cup E\left(\mathcal{C}_{2}\right)\right) \backslash\{e\}$. If $f_{\mathbf{c}_{1}}$ is not indispensable, we continue as above. As the graph $D$ has finite number of edges, continuing in this way, after finite number of steps, we see that there is proper induced balanced cycle $\mathcal{C}^{\prime}$ in $D$ such that $f_{\mathbf{c}^{\prime}}$ is indispensable. This implies that $f_{\mathbf{c}^{\prime}} \in M_{D}$ where $\left|\operatorname{supp}\left(f_{\mathbf{c}^{\prime}}\right)\right|<|E(D)|$ which contradicts the fact that $I_{D}$ is generic.
Case-2: Suppose $D$ has no proper balanced cycles. Then there is proper subgraph $H$ of $D$ such that $H$ consists of two unbalanced cycles share a vertex or two unbalanced cycles connected by a path or two unbalanced cycles share a path and for any $f \in M_{D}$ with $\operatorname{supp}(f)=E(D), \operatorname{supp}\left(f^{+}\right), \operatorname{supp}\left(f^{-}\right)$both contains at least one edge not belonging to $E(H)$. By using [2, Theorem 5.1], $I_{H}$ is a principal ideal, say $I_{H}=\left(f_{\mathbf{m}}\right)$. We see that $\left|\operatorname{supp}\left(f_{\mathbf{m}}\right)\right|<|E(D)|$. Then as $I_{D}$ is generic, there exists $f_{\mathbf{n}} \in M_{D}, \operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$ such that $f_{\mathbf{n}}^{+} \mid f_{\mathbf{m}}^{+}$or $f_{\mathbf{n}}^{-} \mid f_{\mathbf{m}}^{+}$which is contradiction as from above argument $\operatorname{supp}\left(f_{\mathbf{n}}^{+}\right), \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$ both contains at least one edge not belonging to $E(H)$. Thus $D$ is one of above type required graphs.

Suppose $D$ is one of above type required graphs. Then we know that $I_{D}$ is principal and $f$ is the generator of $I_{D}, \operatorname{supp}(f)=E(D)$. Hence, $I_{D}$ is generic.

Remark 3.3. By the Theorem 3.2, if $I_{D}$ is generic, then $I_{D}$ is a principal ideal. But, the converse is need not be true. For example if $D$ consists of a balanced cycle and certain number of trees, then $I_{D}$ is principal ideal but $I_{D}$ is not generic.

Lemma 3.4. Let $D$ be weighted oriented graph consists of one unbalanced cycle $\mathcal{C}_{m_{1}}$ and $n-1$ (balanced or unbalanced) cycles $\mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}, \cdots, \mathcal{C}_{m_{n}}$ sharing a single vertex. Then $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}(A(D))=n-1$.

Proof. Note that $|V(D)|=m_{1}+\cdots+m_{n}-(n-1)$. Let $v_{1} \in V(D)$ be the common vertex of all the cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$. Let $V\left(\mathcal{C}_{m_{i}}\right)=\left\{v_{\sum_{j=1}^{i-1} m_{j}+1}, \ldots, v_{\sum_{j=1}^{i} m_{j}}\right\}$, with the
convention that $v_{1}=v_{\sum_{j=1}^{i} m_{j}+1}$, for $1 \leq i \leq n$. Let the edges $e_{i}$ of $D$ be labelled in the following fashion:
for $1 \leq i \leq n$, each $e_{k}$ is the edge incident to the vertices $v_{k}$ and $v_{k+1}$, for $\sum_{j=1}^{i-1} m_{j}+1 \leq$ $k \leq \sum_{j=1}^{i} m_{j}-1$. Let $A(D)$ be the incidence matrix of $D$ where the rows are ordered by $v_{1}, v_{2}, \ldots, v_{m_{1}}, v_{m_{1}+2}, v_{m_{1}+3}, \ldots, v_{m_{1}+m_{2}}, \ldots, v_{m_{1}+m_{2}+\ldots+m_{n-1}}, v_{m_{1}+m_{2}+\ldots+m_{n-1}+2}, \ldots$,
$v_{m_{1}+m_{2}+\ldots+m_{n}}$, and the columns are ordered by $e_{1}, e_{2}, \ldots, e_{m_{1}+m_{2}+\ldots+m_{n}}$. We define $\widetilde{A(D)}$ to be the matrix obtained from the incidence matrix $A(D)$ by deleting $\left(\sum_{i=1}^{r} m_{i}\right)^{\text {th }}$ column for $r=2,3, \ldots, n$. Then $\widetilde{A(D)}$ is a block triangular matrix of the form $\left[\begin{array}{l|l}A & B \\ \hline O & C\end{array}\right]$ where $A$ is an $m_{1} \times m_{1}$ matrix and $C$ is an $m_{2}+m_{3}+\ldots+m_{n}-(n-1) \times m_{2}+m_{3}+\ldots+m_{n}-(n-1)$ upper triangular matrix. Again $A$ is the incidence matrix of $\mathcal{C}_{m_{1}}$. Since toric ideal of unbalanced cycle is zero, $\operatorname{det}(A) \neq 0$. On the other hand, $C$ is an upper triangular matrix having each diagonal entry positive. This implies that $\operatorname{det}(C) \neq 0$. These two arguments show that $\operatorname{det}(\widetilde{A(D)}) \neq 0$. So, rank of the matrix $\widetilde{A(D)}$ is $m_{1}+m_{2}+\ldots+m_{n}-(n-1)$. Therefore rank of the matrix $A(D) \geq m_{1}+m_{2}+\ldots+m_{n}-(n-1)$. Again, rank of the matrix $A(D) \leq m_{1}+m_{2}+\ldots+m_{n}-(n-1)$. This implies rank of the matrix $A(D)=m_{1}+m_{2}+\ldots+m_{n}-(n-1)$ and hence, nullity $(A(D))=n-1$.

Lemma 3.5. Let $D$ be a weighted oriented graph consists of $n$ cycles sharing a common vertex. Let $D^{\prime}$ be a weighted oriented graph consists $D$ and disjoint cycles $\mathcal{C}_{1}, \mathcal{C}_{2}, \ldots, \mathcal{C}_{k}$ such that $\mathcal{C}_{1}$ is unbalanced and each $\mathcal{C}_{i}$ is connected by a path $P_{i}$ with $D$. Then

$$
\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D^{\prime}\right)\right)=n+k-1
$$

Proof. Let $\mathcal{C}_{1}^{\prime}, \mathcal{C}_{2}^{\prime}, \ldots, \mathcal{C}_{n}^{\prime}$ be the cycles in $D$ sharing a vertex. Let $\mathcal{C}_{1}$ be connected by the path $P_{1}$ with the cycle $\mathcal{C}_{1}^{\prime}$ in $D$. We label vertices and edges of $D^{\prime}$ in the following order: first we start labelling $\mathcal{C}_{1}$ (of vertices and edges) followed by labelling of $P_{1}$, then label $\mathcal{C}_{1}^{\prime}, \mathcal{C}_{2}^{\prime}, \ldots, \mathcal{C}_{n}^{\prime}$, and then label $P_{2}$ followed by $\mathcal{C}_{2}, P_{3}$ followed by $\mathcal{C}_{3}$, and so on lastly $P_{k}$ followed by $\mathcal{C}_{k}$. Let $A\left(D^{\prime}\right)$ be the incidence matrix of $D^{\prime}$ with respect to above vertex and edge ordering. We define $\widetilde{A\left(D^{\prime}\right)}$ is the matrix obtained from $A\left(D^{\prime}\right)$ by deleting columns corresponding to last labelling edge of $E\left(\mathcal{C}_{j}^{\prime}\right)$ and $E\left(\mathcal{C}_{l}\right)$, for $j=1,2, \ldots, n$, $l=2, \ldots, k$. Then $\widetilde{A\left(D^{\prime}\right)}$ is a block triangular matrix of the form $\left[\begin{array}{c|c}A & B \\ \hline O & C\end{array}\right]$ where $A$ is
an $\left|V\left(\mathcal{C}_{1}\right)\right| \times\left|E\left(\mathcal{C}_{1}\right)\right|$ matrix and $C$ is an $\left(\left|V\left(D^{\prime}\right)\right|-\left|V\left(\mathcal{C}_{1}\right)\right|\right) \times\left(\left|E\left(D^{\prime}\right)\right|-(n+k-1)-\left|E\left(\mathcal{C}_{1}\right)\right|\right)$ upper triangular matrix. Note that $A$ is the incidence matrix of $\mathcal{C}_{1}$. Since the toric ideal of unbalanced cycle is zero, $\operatorname{det}(A) \neq 0$. On the other hand, $C$ is an upper triangular matrix having each diagonal entry positive. This implies that $\operatorname{det}(C) \neq 0$. These two arguments show that $\operatorname{det}\left(\widetilde{A\left(D^{\prime}\right)}\right) \neq 0$. So, rank of the matrix $\widetilde{A\left(D^{\prime}\right)}$ is $\left|V\left(D^{\prime}\right)\right|=\left|E\left(D^{\prime}\right)\right|-$ $(n+k-1)$. Therefore $\operatorname{rank}\left(A\left(D^{\prime}\right)\right) \geq\left|V\left(D^{\prime}\right)\right|=\left|E\left(D^{\prime}\right)\right|-(n+k-1)$. This implies that $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D^{\prime}\right)\right) \leq n+k-1$. Let $f_{\mathbf{a}_{\mathbf{j}}}$ be the generator of toric ideal of unbalanced cycle $\mathcal{C}_{1}$ and cycle $\mathcal{C}_{j}$ connected by path and $f_{\mathbf{a}_{1}^{\prime}}$ be the generator of toric ideal of unbalanced cycle $\mathcal{C}_{1}$ and cycle $\mathcal{C}_{l}^{\prime}$ connected by path for $j=2,3, \ldots, k, l=1,2, \ldots, n$. Taking embedding of $\mathbf{a}_{\mathbf{j}}, \mathbf{a}_{\mathbf{1}}^{\prime}$ in $\operatorname{Null}\left(A\left(D^{\prime}\right)\right)$, we see that $\left\{\mathbf{a}_{\mathbf{j}}, \mathbf{a}_{\mathbf{1}}^{\prime}: j=2,3, \ldots, k, l=1,2, \ldots, n\right\}$ is linearly independent. Thus $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D^{\prime}\right)\right) \geq n+k-1$. Hence $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D^{\prime}\right)\right)=n+k-1$.

Proposition 3.6. Let $D$ be weighted oriented graph and $A(D)=\left[\begin{array}{llll}\mathbf{a}_{\mathbf{1}} & \mathbf{a}_{\mathbf{2}} & \ldots & \mathbf{a}_{\mid \mathbf{E}(\mathbf{D})}\end{array}\right]$ be the incidence matrix of $D$. Let $S$ be an affine semigroup in $\mathbb{Z}_{+}{ }^{|V(D)|}$ minimally generated by $\mathbf{a}_{\mathbf{1}}, \mathbf{a}_{2}, \ldots, \mathbf{a}_{|\mathbf{E}(\mathbf{D})|}$. Then the Krull dimension of $K[S]$ is equal to rank of $A(D)$.

Proof. Let $\phi: \mathbb{Z}^{|E(D)|} \rightarrow \mathbb{Z}^{|V(D)|}$ be a group homomorphism defined by $e_{i} \rightarrow \mathbf{a}_{\mathbf{i}}$ where $\left\{\mathbf{e}_{1}, \mathbf{e}_{2}, \ldots, \mathbf{e}_{|\mathbf{E}(\mathbf{D})|}\right\}$ is the canonical basis of $\mathbb{Z}^{|E(D)|}$. Then by [14, Proposition 7.5], the Krull dimension of $K[S]$ is equal to $|E(D)|-\operatorname{rank}(\operatorname{ker}(\phi))$. Since $\operatorname{ker}(\phi)$ is a submodule of a free module, we have $\operatorname{ker} \phi \cong \mathbb{Z}^{r}$, where $r \leq|E(D)|$. Then by Rank-Nullity theorem, we have $\operatorname{rank}(A(D))=|E(D)|-r$, as required.

Corollary 3.7. Let $D$ be weighted oriented graph as in Lemma 3.4. Then the Krull dimension of $K[e: e \in E(D)] / I_{D}$ is equal to $m_{1}+m_{2}+\cdots+m_{m}-(n-1)$.

Proof. Let $A(D)=\left[\begin{array}{llll}\mathbf{a}_{\mathbf{1}} & \mathbf{a}_{\mathbf{2}} & \ldots & \mathbf{a}_{\mid \mathbf{E}(\mathbf{D})}\end{array}\right]$ be the incidence matrix of $D$. Let $A$ be the affine semigroup in $\mathbb{Z}_{+}{ }^{|V(D)|}$ minimally generated by $\mathbf{a}_{\mathbf{1}}, \mathbf{a}_{2}, \ldots, \mathbf{a}_{|\mathbf{E}(\mathbf{D})|}$. Then $K[A] \cong \frac{K[e: e \in E(D)]}{I_{D}}$. Using Proposition 3.6, we have the Krull dimension of $K[A]$ is equal to the rank of $A(D)$. Then using Lemma 3.4, this corollary follows.

In the rest of the section, we show that the toric ideal of three weighted oriented unbalanced cycles sharing a vertex, is strongly robust. We achieve this by giving explicitly the unique minimal binomial generating set of the toric ideal. Below we give the figure and notation that we are going to use rest of this section.

Notation 3.8. Let $D$ be weighted oriented graph consists of three unbalanced cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ such that these cycles share only a single vertex $v_{1}$ as given in above figure. Let $V\left(\mathcal{C}_{m_{i}}\right)=\left\{v_{\sum_{j=1}^{i-1} m_{j}+1}, \ldots, v_{\sum_{j=1}^{i} m_{j}}\right\}$, with the convention that $v_{1}=v_{\sum_{j=1}^{i} m_{j}+1}$, for $1 \leq i \leq 3$. and for $1 \leq i \leq 3$, each $e_{k}$ is the edge incident to the vertices $v_{k}$ and $v_{k+1}$, for $\sum_{j=1}^{i-1} m_{j}+1 \leq k \leq \sum_{j=1}^{i} m_{j}-1$, and the edge $e_{\sum_{j=1}^{i} m_{j}}$ is incident to the vertices $v_{\sum_{j=1}^{i} m_{j}}$ and $v_{1}$. Let $D_{i}$ be the induced subgraph of $D$ that contains precisely $\mathcal{C}_{m_{i}}, \mathcal{C}_{m_{i+1}}$ for $1 \leq i \leq 3$ under convention $\mathcal{C}_{m_{4}}=\mathcal{C}_{m_{1}}$. Below we draw picture of $D$.

Lemma 3.9. For any matrix $A$ with entries of non-negative integers, the corresponding toric ideal $I_{A}$ is generated by the set of primitive binomials belonging to $I_{A}$. That is, $I_{A}$ is generated by $G r_{A}$.

Proof. Let $f_{\mathrm{m}} \in I_{A}$ be a part of a generating set of binomials of $I_{A}$. Suppose $f_{\mathrm{m}}$ is not a primitive binomial. Then there exists $f_{\mathbf{x}} \in I_{A}$ such that $f_{\mathbf{x}}^{+} \mid f_{\mathbf{m}}^{+}$and $f_{\mathbf{x}}^{-} \mid f_{\mathbf{m}}^{-}$. This implies that $\mathbf{e}^{\mathbf{x}_{+}} \mid \mathbf{e}^{\mathbf{m}_{+}}$and $\mathbf{e}^{\mathbf{x}_{-}} \mid \mathbf{e}^{\mathbf{m}_{-}}$. This gives that $\mathbf{y}:=\mathbf{m}-\mathbf{x} \in \operatorname{Null}(A)$ and $\mathbf{y}_{+}=\mathbf{m}_{+}-\mathbf{x}_{+} \geq 0$ and $\mathbf{y}_{-}=\mathbf{m}_{-}-\mathbf{x}_{-} \geq 0$. Thus $f_{\mathbf{y}} \in I_{A}$ and $f_{\mathbf{m}} \in\left(f_{\mathbf{x}}, f_{\mathbf{y}}\right)$ (using Lemma 2.5(ii)). If $f_{\mathbf{x}}, f_{\mathbf{y}}$ are not primitive binomials, then we proceed as above until we end with primitive binomials. Continuing in this way after finite number of steps we can show that $f_{\mathrm{m}}$ is a polynomial combination of primitive binomials belonging to $I_{A}$. Thus $I_{A}$ is generated by primitive binomials in it.

Lemma 3.10. Let $D$ be weighted oriented graph and $\mathcal{C}_{1}$ be a balanced cycle such that both these are connected by a path of length $k \geq 0$ ( $k=0$ means $\mathcal{C}_{1}$ shares only one vertex with
$D)$. If $f_{\mathbf{a}} \in I_{D}$ such that $E\left(\mathcal{C}_{1}\right) \subseteq \operatorname{supp}(f)$, then $f_{\mathbf{c}_{1}}^{+} \mid f_{\mathbf{a}}^{+}$and $f_{\mathbf{c}_{1}}^{-} \mid f_{\mathbf{a}}^{-}$, for some primitive binomial $f_{\mathbf{c}_{1}} \in I_{\mathcal{C}_{1}}$ and $f_{\mathbf{c}_{1}} \prec f_{\mathbf{a}}$.

Proof. Let $V\left(\mathcal{C}_{1}\right)=\left\{v_{1}, v_{2}, \ldots, v_{m_{1}}\right\}, E\left(\mathcal{C}_{1}\right)=\left\{e_{1}, e_{2}, \ldots, e_{m_{1}}\right\}$, where $v_{1}$ is vertex belonging to the connecting path, and $e_{i}$ is incident with $v_{i}$ and $v_{i+1}$, for $i=1,2, \ldots, m_{1}$, under convention that $v_{m_{1}+1}=v_{1}$. Let $A\left(\mathcal{C}_{1}\right)=\left[a_{k l}\right]_{m_{1} \times m_{1}}$. Assume $f_{\mathbf{a}} \in I_{D}$ and $E\left(\mathcal{C}_{1}\right) \subseteq \operatorname{supp}(f)$. Then we have $A(D) \mathbf{a}=0$ which gives that $a_{k(k-1)}[\mathbf{a}]_{k-1}=a_{k k}[\mathbf{a}]_{k}$, for $2 \leq k \leq m_{1}$. This implies that

$$
\begin{aligned}
a_{11}[\mathbf{a}]_{1}-a_{1 m_{1}}[\mathbf{a}]_{m_{1}} & =\frac{a_{22} a_{33} \ldots a_{m_{1} m_{1}}}{a_{21} a_{32} \ldots a_{m_{1} m_{1}-1}}[\mathbf{a}]_{m_{1}}-a_{1 m_{1}}[\mathbf{a}]_{m_{1}} \\
& =\frac{a_{11} a_{22} a_{33} \ldots a_{m_{1} m_{1}}-a_{21} a_{32} \ldots a_{m_{1}\left(m_{1}-1\right)} a_{1 m_{1}}}{a_{21} a_{32} \ldots a_{m_{1}\left(m_{1}-1\right)}}[\mathbf{a}]_{m_{1}} \\
& =\frac{\operatorname{det}\left(A\left(\mathcal{C}_{1}\right)\right)}{a_{21} a_{32} \ldots a_{m_{1}\left(m_{1}-1\right)}}[\mathbf{a}]_{m_{1}} \\
& =0 \text { (because } \operatorname{det}\left(A\left(\mathcal{C}_{1}\right)\right)=0 \text { as } \mathcal{C}_{1} \text { is balanced) }
\end{aligned}
$$

Thus the above equalities gives that $\left.\mathbf{a}\right|_{E\left(\mathcal{C}_{1}\right)} \in \operatorname{Null}\left(A\left(\mathcal{C}_{1}\right)\right)$. Since $\operatorname{Null}\left(A\left(\mathcal{C}_{1}\right)\right)$ has dimension 1, let $\left\{\mathbf{a}_{\mathbf{1}}\right\}$ be a basis of $\operatorname{Null}\left(A\left(\mathcal{C}_{1}\right)\right)$, where $\mathbf{a}_{\mathbf{1}}$ with integer entries. Then $\left.\mathbf{a}\right|_{E\left(\mathcal{C}_{1}\right)}=k \mathbf{c}_{\mathbf{1}}$ for some positive integer $k$. This implies that $f_{\mathbf{c}_{\mathbf{1}}}^{+} \mid f_{\mathbf{a}}^{+}$and $f_{\mathbf{c}_{\mathbf{1}}}^{-} \mid f_{\mathbf{a}}^{-}$. This completes the proof.

Below we show that a WOG of finite oriented cycles sharing a common vertex is strongly robust.

Theorem 3.11. Let $D$ be a weighted oriented graph of finite number of cycles share a single vertex. Then $I_{D}$ is strongly robust.

Proof. Note that $\mathcal{M}_{D} \subseteq G r_{D}$. Suppose $f_{\mathbf{n}} \in G r_{D} \backslash \mathcal{M}_{D}$. Then $f_{\mathbf{n}}$ is not a part of a system of minimal generators of $I_{D}$. This implies that $f_{\mathbf{n}}$ is a combination of remaining elements of that minimal system of generators of $I_{D}$. Then by comparing the monomials both sides of this equality we get that there exists $f_{\mathbf{m}} \in G r_{D} \backslash\left\{f_{\mathbf{n}}\right\}$ such that $f_{\mathbf{m}}^{+} \mid f_{\mathbf{n}}^{+}$.

For any $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)$, there exists an edge $e_{j} \in \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)$such that $e_{i}, e_{j}$ are incident with a vertex $v$ of degree 2. Since $e_{j} \in \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{+}\right)$and $v$ is incident with only $e_{i}, e_{j}$, then $e_{i} \in \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$. If $a_{i}, a_{j}$ are exponents of $e_{i}, e_{j}$ respectively in $f_{\mathbf{m}}$, then from $A(D) \mathbf{m}=\mathbf{0}$ (by comparing the row corresponding to $v$ ), we get $a_{j} y-a_{i} x=0$ for some positive integers $x, y$. If $b_{i}, b_{j}$ are exponents of $e_{i}, e_{j}$ respectively in $f_{\mathbf{n}}$, then from
$A(D) \mathbf{n}=\mathbf{0}$ (by comparing the row corresponding to $v$ ), we get $b_{j} y-b_{i} x=0$ for the same above $x, y$. Since $f_{\mathbf{m}}^{+} \mid f_{\mathbf{n}}^{+}$, this implies that $a_{j} \leq b_{j}$ which yields that $a_{i} \leq b_{i}$ and hence $e_{i}^{a_{i}} \mid e_{i}^{b_{i}}$. Thus $f_{\mathbf{m}}^{-} \mid f_{\mathbf{n}}^{-}$. This is a contradiction because $f_{\mathbf{n}}$ is a primitive binomial. Hence $f_{\mathbf{n}}$ is a part of minimal generators of $I_{D}$. Thus $G r_{D} \subseteq \mathcal{M}_{D}$. The reverse inclusion is always true. Therefore $G r_{D}=\mathcal{M}_{D}$. Hence $I_{D}$ is strongly robust.

Theorem 3.12. Let $D$ be the weighted oriented graph consists of certain number of cycles share a vertex $v$. Let $D^{\prime}$ be the graph consists of $D$ and certain number of cycles such that each of these cycles is connected by a path at $v$ with $D$. Then $I_{D^{\prime}}$ is strongly robust.

Proof. Note that $\mathcal{M}_{D^{\prime}} \subseteq G r_{D^{\prime}}$. Suppose $f_{\mathbf{n}} \in G r_{D^{\prime}} \backslash \mathcal{M}_{D^{\prime}}$. Then there exists $f_{\mathbf{m}} \in$ $G r_{D^{\prime}} \backslash\left\{f_{\mathbf{n}}\right\}$ such that $f_{\mathbf{m}}^{+} \mid f_{\mathbf{n}}^{+}$. Let $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)$. We prove that $e_{i} \in \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$and the exponent of $e_{i}$ in $f_{\mathbf{m}}^{-}$is less than or equal to the exponent of $e_{i}$ in $f_{\mathbf{n}}^{-}$.

Step 1: If $e_{i}$ belongs to cycle or connecting path where the length of this path is greater than 1 , then there exists an edge $e_{j}$ such that $e_{i}, e_{j}$ are incident with same vertex of degree 2. Then using arguments as in Theorem $3.11, e_{i} \in \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$and exponent of $e_{i}$ in $\operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)$is less than or equal to exponent of $e_{i}$ in $\operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$.
Step 2: Now assume $e_{i}$ belongs to connecting path of length 1 . Let $\mathcal{C}_{s}$ be the cycle connected by $e_{i}$ at $v$ with $D$. Let $v_{1}$ be the vertex belonging to $V\left(\mathcal{C}_{s}\right)$ such that $e_{i}$ is incident with $v_{1}$. Let other two edges in $E\left(\mathcal{C}_{s}\right)$ incident with $v_{1}$ be $e_{x}, e_{y}$. Using Lemma 2.7 and $\operatorname{supp}\left(f_{\mathbf{m}}^{+}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{+}\right)$, we get that $E\left(\mathcal{C}_{s}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{m}}\right) \cap \operatorname{supp}\left(f_{\mathbf{n}}\right)$ and $\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)} \prec$ $\left.\mathbf{n}\right|_{E\left(\mathcal{C}_{s}\right)}$. Now we show that $\mathcal{C}_{s}$ is unbalanced. If possible, suppose $\mathcal{C}_{s}$ is balanced. Then by the Lemma 3.10, we get that $\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)} \in \operatorname{Null}\left(A\left(\mathcal{C}_{s}\right)\right)$. This implies that $f_{\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}} \in I_{D^{\prime}}$. Note that $f_{\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}} \neq f_{\mathbf{m}}$, because $e_{i} \notin \operatorname{supp}\left(f_{\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}}\right)$ and $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}\right)$. We see that $f_{\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}}^{+}\left|f_{\mathbf{m}}^{+}, f_{\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}}^{-}\right| f_{\mathbf{m}}^{-}$which is contradiction as $f_{\mathbf{m}}$ is primitive. Thus $\mathcal{C}_{s}$ is unbalanced. Using similar arguments as above, $\operatorname{supp}\left(f_{\mathbf{m}}\right)$ and $\operatorname{supp}\left(f_{\mathbf{n}}\right)$ can not contain edge set of any balanced cycle. Since $E\left(\mathcal{C}_{s}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{m}}\right) \cap \operatorname{supp}\left(f_{\mathbf{n}}\right)$ and $f_{\mathbf{m}} \neq 0, f_{\mathbf{n}} \neq 0$, this implies that there exists an unbalanced cycle $\mathcal{C}_{t}(t \neq s)$ in $D^{\prime}$ such that $E\left(\mathcal{C}_{t}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{m}}\right) \cap \operatorname{supp}\left(f_{\mathbf{n}}\right)$.

Let $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E\left(D_{1}\right)$ where $D_{1}$ is the subgraph of $D^{\prime}$ consists of all unbalanced cycles and their connecting paths in $\operatorname{supp}\left(f_{\mathbf{n}}\right)$. Denote all the unbalanced cycles of $D_{1}$ by $\mathcal{C}_{1}, \mathcal{C}_{2} \ldots, \mathcal{C}_{l} . \operatorname{As} \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{+}\right)$and using Lemma 2.7, Proposition 2.6(i) and using the argument that toric ideal of unbalanced cycle is zero, it follows that $\operatorname{supp}\left(f_{\mathbf{m}}\right) \subseteq E\left(D_{1}\right)$ and $f_{\mathrm{m}} \in I_{D_{1}}$. For any $j \in\{1,2, \ldots, l\}, j \neq t$, by [2, Theorem 5.1], the toric ideal of unbalanced cycles $\mathcal{C}_{t}$ and $\mathcal{C}_{j}$ connected by a path of length $k \geq 0$ ( $k=0$ means share a
vertex) is principal, say, generated by the primitive binomial $f_{\mathbf{a}_{\mathbf{j}}}$ for some vector $\mathbf{a}_{\mathbf{j}}$. Let $A=\left\{\mathbf{a}_{\mathbf{s}}, \mathbf{a}_{\mathbf{j}}: j=1,2, \ldots, l, j \notin\{s, t\}\right\}$. For each $k \in\{1,2, \ldots, l\}, k \neq t$ and $e_{j} \in E\left(\mathcal{C}_{k}\right)$, we have $j \in \operatorname{supp}\left(\mathbf{a}_{\mathbf{k}}\right), j \notin \operatorname{supp}\left(\mathbf{a}_{\mathbf{r}}\right)$ for each $r \in\{1,2, \ldots, l\} \backslash\{t, k\}$. Thus $A$ is linearly independent. By Lemma 3.5, we get that $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D_{1}\right)\right)=l-1=|A|$. Hence $A$ is basis of $\operatorname{Null}\left(A\left(D_{1}\right)\right)$. As $E\left(\mathcal{C}_{s}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{m}}\right)$, without loss of any generality, assume that $\left.\left.\mathbf{a}_{\mathbf{s}}\right|_{E\left(\mathcal{C}_{s}\right)} \prec \mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)}$. Since $\left.\left.\mathbf{m}\right|_{E\left(\mathcal{C}_{s}\right)} \prec \mathbf{n}\right|_{E\left(\mathcal{C}_{s}\right)}$, then $\left.\mathbf{a}_{\mathbf{s}}\right|_{E\left(\mathcal{C}_{s}\right)} \prec \mathbf{n}$.

Since $A$ is a basis of $\operatorname{Null}\left(A\left(D_{1}\right)\right)$ and $\left.\mathbf{m}\right|_{E\left(D_{1}\right)},\left.\mathbf{n}\right|_{E\left(D_{1}\right)} \in \operatorname{Null}\left(A\left(D_{1}\right)\right)$, then there exist $\mu_{k}, \lambda_{k} \in \mathbb{Q}$ such that $\left.\mathbf{m}\right|_{E\left(D_{1}\right)}=\sum_{k=1, k \neq t}^{l} \mu_{k} \mathbf{a}_{\mathbf{k}}$ and $\left.\mathbf{n}\right|_{E\left(D_{1}\right)}=\sum_{k=1, k \neq t}^{l} \lambda_{k} \mathbf{a}_{\mathbf{k}}$. Now compare the $k^{t h}$ component both sides, this gives that $[\mathbf{m}]_{k}=\mu_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{k}$ and $[\mathbf{n}]_{k}=\lambda_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{k}$ for all $e_{k} \in$ $E\left(\mathcal{C}_{s}\right)$. Since for any $e_{k} \in E\left(\mathcal{C}_{s}\right)$, we have either $k \in \operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\mathbf{n}_{+}\right) \cap \operatorname{supp}\left(\left(\mathbf{a}_{\mathbf{s}}\right)_{+}\right)$ or $k \in \operatorname{supp}\left(\mathbf{m}_{-}\right) \cap \operatorname{supp}\left(\mathbf{n}_{-}\right) \cap \operatorname{supp}\left(\left(\mathbf{a}_{\mathbf{s}}\right)_{-}\right)$, this implies that $\mu_{s}>0, \lambda_{s}>0$. Now compare the $i^{\text {th }}$ component both sides of expressions of $\mathbf{m}, \mathbf{n}$, we get $[\mathbf{m}]_{i}=\mu_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{i}$ and $[\mathbf{n}]_{i}=\lambda_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{i}$. Since $\mu_{s}>0, \lambda_{s}>0$, and $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)$, this implies that $e_{i} \in \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$. Thus we proved that $\operatorname{supp}\left(f_{\mathbf{m}}^{-}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$.

Since $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right)$, and $v_{1}$ is incident to the edges $e_{i}, e_{x}, e_{y}$, then the Lemma 2.7, we get either $e_{x}$ or $e_{y}$ belongs to $\operatorname{supp}\left(f_{\mathbf{m}}^{+}\right)$, say $e_{x} \in \operatorname{supp}\left(f_{\mathbf{m}}^{+}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{+}\right)$. Now compare the $x^{\text {th }}$ component both sides of expressions of $\mathbf{m}, \mathbf{n}$, we get $0<[\mathbf{m}]_{x}=\mu_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{x}$ and $0<[\mathbf{n}]_{x}=\lambda_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{x}$. As $f_{\mathbf{m}}^{+} \mid f_{\mathbf{n}}^{+}$, this implies that $[\mathbf{m}]_{x} \leq[\mathbf{n}]_{x}$ which gives that $\mu_{s} \leq \lambda_{s}$. Since $e_{i} \in \operatorname{supp}\left(f_{\mathbf{m}}^{-}\right) \subseteq \operatorname{supp}\left(f_{\mathbf{n}}^{-}\right)$, we have $[\mathbf{m}]_{i}<0$ and $[\mathbf{n}]_{i}<0$. Since $[\mathbf{m}]_{i}=\mu_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{i}$ and $[\mathbf{n}]_{i}=\lambda_{s}\left[\mathbf{a}_{\mathbf{s}}\right]_{i}$ and $0<\mu_{s} \leq \lambda_{s}$, we get that $[\mathbf{m}]_{i} \geq[\mathbf{n}]_{i}$. This implies that the exponent of $e_{i}$ in $f_{\mathbf{m}}^{-}$is less than or equal to the exponent of $e_{i}$ in $f_{\mathbf{n}}^{-}$. Hence in both the Steps 1 and 2, we get that $f_{\mathbf{m}}^{-} \mid f_{\mathbf{n}}^{-}$. This is a contradiction because $f_{\mathbf{n}}$ is primitive. Thus $G r_{D^{\prime}}=\mathcal{M}_{D^{\prime}}$.

Below we explicitly compute unique minimal generating set of $I_{D}$, where $D$ consists of three odd cycles sharing a vertex.

Theorem 3.13. Let $D$ be the weighted oriented graph consists of three odd cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ such that these cycles share only a single vertex as in Notation 3.8. Let $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ are generated by $\left\{f_{\mathbf{a}}\right\},\left\{f_{\mathbf{b}}\right\},\left\{f_{\mathbf{c}}\right\}$ respectively, where $\mathbf{a}=\left((-1)^{i+1} a_{i}\right)_{i=1}^{m_{1}+m_{2}}, \mathbf{b}=\left((-1)^{i} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}+m_{3}}$, $\mathbf{c}=\left(\left((-1)^{i+1} c_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} c_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}$. Then

$$
\mathcal{U}_{D}=G r_{D}=M_{D}=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}, f_{\mathbf{x}}, f_{\mathbf{y}}, f_{\mathbf{z}}: \mathbf{x} \in S_{1}, \mathbf{y} \in S_{2}, \mathbf{z} \in S_{3}\right\}
$$

where $d_{1}=\operatorname{gcd}\left(a_{1}, a_{2}, \ldots, a_{m_{1}}\right), d_{2}=\operatorname{gcd}\left(b_{m_{1}+m_{2}+1}, \ldots, b_{m_{1}+m_{2}+m_{3}}\right)$,
$d_{3}=\operatorname{gcd}\left(a_{m_{1}+1}, \ldots, a_{m_{1}+m_{2}}\right), d_{4}=\operatorname{gcd}\left(c_{m_{1}+m_{2}+1}, \ldots, c_{m_{1}+m_{2}+m_{3}}\right)$,
$d_{5}=\operatorname{gcd}\left(b_{m_{1}+1}, \ldots, b_{m_{1}+m_{2}}\right), d_{6}=\operatorname{gcd}\left(c_{1}, c_{2}, \ldots, c_{m_{1}}\right)$,
$S_{1}=\left\{\left(\left((-1)^{i+1} \frac{p_{1}}{d_{1}} a_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i+1}\left(\frac{p_{1}}{d_{1}} a_{i}+\frac{p_{2}}{d_{2}} b_{i}\right)\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i+1} \frac{p_{2}}{d_{2}} b_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right.$ $\left(p_{1}, p_{2}\right) \in E_{1}$ is a minimal element in $\left.E_{1}\right\}$,
$S_{2}=\left\{\left(\left((-1)^{i+1} \frac{p_{3}}{d_{3}} a_{i}+\frac{p_{4}}{d_{4}} c_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i+1} \frac{p_{3}}{d_{3}} a_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i} \frac{p_{4}}{d_{4}} c_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right.$ $\left(p_{3}, p_{4}\right) \in E_{2}$ is a minimal element in $\left.E_{2}\right\}$,
$S_{3}=\left\{\left(\left((-1)^{i+1} \frac{p_{6}}{d_{6}} c_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} \frac{p_{5}}{d_{5}} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i}\left(\frac{p_{5}}{d_{5}} b_{i}+\frac{p_{6}}{d_{6}} c_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right.$
$\left(p_{5}, p_{6}\right) \in E_{3}$ is a minimal element in $\left.E_{3}\right\}$,
$E_{1}=\left\{\left(p_{1}, p_{2}\right) \in\left[d_{1}-1\right] \times\left[d_{2}-1\right]: \frac{p_{1}}{d_{1}} a_{j}+\frac{p_{2}}{d_{2}} b_{j} \in \mathbb{N}, m_{1}+1 \leq j \leq m_{1}+m_{2}\right\}$,
$E_{2}=\left\{\left(p_{3}, p_{4}\right) \in\left[d_{3}-1\right] \times\left[d_{4}-1\right]: \frac{p_{3}}{d_{3}} a_{j}+\frac{p_{4}}{d_{4}} c_{j} \in \mathbb{N}, 1 \leq j \leq m_{1}\right\}$,
$E_{3}=\left\{\left(p_{5}, p_{6}\right) \in\left[d_{5}-1\right] \times\left[d_{6}-1\right]: \frac{p_{5}}{d_{5}} b_{j}+\frac{p_{6}}{d_{6}} c_{j} \in \mathbb{N}, m_{1}+m_{2}+1 \leq j \leq m_{1}+m_{2}+m_{3}\right\}$.
Before proving this theorem, first we prove the below proposition:
Proposition 3.14. Assume all the notations of the Theorem 3.13. Then the set of primitive binomials in $I_{D}$ is precisely $M_{D}$.

Proof. Let $f_{\mathbf{n}} \in I_{D}$ be a pure binomial such that $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$. Without loss of any generality, assume that $1 \in \operatorname{supp}\left(\left(\left.\mathbf{n}\right|_{E\left(\mathcal{C}_{1}\right)}\right)_{+}\right), m_{1}+1 \in \operatorname{supp}\left(\left(\left.\mathbf{n}\right|_{E\left(\mathcal{C}_{2}\right.}\right)_{+}\right), m_{1}+m_{2}+1 \in$ $\operatorname{supp}\left(\left(\left.\mathbf{n}\right|_{E\left(\mathcal{C}_{2}\right)}\right)_{+}\right)$. Then by using the Lemma 2.7 applied to each vertex of degree 2 in $D$, we have the following possible forms for $\mathbf{n}$ :
$\mathbf{n}=\left(\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{1}\right)},-\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{\mathbf{2}}\right)},\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{3}\right)}\right)$ or $\mathbf{n}=\left(\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{1}\right)},\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{\mathbf{2}}\right)},-\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{3}\right)}\right)$ or
$\mathbf{n}=\left(\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{1}\right)},-\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{\mathbf{2}}\right)},-\left.\mathbf{n}\right|_{\mathbf{E}\left(\mathcal{C}_{\mathbf{3}}\right)}\right)$. This implies that

$$
\begin{gather*}
\mathbf{n}=\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}+m_{3}} \text { or }  \tag{1}\\
\mathbf{n}=\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}} \text { or }  \tag{2}\\
\mathbf{n}=\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}+m_{3}} \tag{3}
\end{gather*}
$$

where $n_{i} \in \mathbb{N}$.
Assume that $\mathbf{n}$ is of the form as in (11). Since $\{\mathbf{a},-\mathbf{b}\}$ is a basis of $\operatorname{Null}(A(D))$ and we get that $\mathbf{n}=\frac{p_{1}^{\prime}}{d_{1}^{2}} \mathbf{a}+\frac{p_{2}^{\prime}}{d_{2}^{\prime}}(-\mathbf{b})$, for some $\frac{p_{1}^{\prime}}{d_{1}^{\prime}}, \frac{p_{2}^{\prime}}{d_{2}^{\prime}} \in \mathbb{Q}+\operatorname{with} \operatorname{gcd}\left(p_{1}^{\prime}, d_{1}^{\prime}\right)=1, \operatorname{gcd}\left(p_{2}^{\prime}, d_{2}^{\prime}\right)=1$. This implies that

$$
\begin{equation*}
n_{i}=\frac{p_{1}^{\prime}}{d_{1}^{\prime}} a_{i}+\frac{p_{2}^{\prime}}{d_{2}^{\prime}} b_{i}, n_{j}=\frac{p_{1}^{\prime}}{d_{1}^{\prime}} a_{j}, \quad n_{k}=\frac{p_{2}^{\prime}}{d_{2}^{\prime}} b_{k} \tag{4}
\end{equation*}
$$

for $i=m_{1}+1, \ldots, m_{1}+m_{2}, j=1,2, \ldots, m_{1}, k=m_{1}+m_{2}+1, \ldots, m_{1}+m_{2}+m_{3}$.
From (4), it follows that $d_{1}^{\prime}\left|a_{i}, d_{2}^{\prime}\right| b_{j}$, for $i=1,2, \ldots, m_{1}, \quad j=m_{1}+m_{2}+1, \ldots, m_{1}+$ $m_{2}+m_{3}$. Then $d_{1}^{\prime}\left|d_{1}, d_{2}^{\prime}\right| d_{2}$, by definition of $d_{1}, d_{2}$. Then we can write $\frac{p_{1}^{\prime}}{d_{1}^{\prime}}=\frac{p_{1}^{\prime \prime}}{d_{1}}, \frac{p_{2}^{\prime}}{d_{2}^{\prime}}=\frac{p_{2}^{\prime \prime}}{d_{2}}$ for some $p_{1}^{\prime \prime} \in \mathbb{N}, p_{2}^{\prime \prime} \in \mathbb{N}$. By division algorithm, we have $p_{1}^{\prime \prime}=p_{1}^{\prime \prime \prime}+r_{1} d_{1}, p_{2}^{\prime \prime}=p_{2}^{\prime \prime \prime}+r_{2} d_{2}$, for some $0 \leq p_{1}^{\prime \prime \prime} \leq d_{1}-1,0 \leq p_{2}^{\prime \prime \prime} \leq d_{2}-1$, and $r_{1}, r_{2} \in \mathbb{N} \cup\{0\}$. Thus we have

$$
\begin{equation*}
\mathbf{n}=\left(\frac{p_{1}^{\prime \prime \prime}}{d_{1}}+r_{1}\right) \mathbf{a}+\left(\frac{p_{2}^{\prime \prime \prime}}{d_{2}}+r_{2}\right)(-\mathbf{b}), p_{i}^{\prime \prime \prime}<d_{i}, i=1,2 \tag{5}
\end{equation*}
$$

First we show that each binomial in $M_{D}$ is primitive. Since $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ are circuit binomials, we have that $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ are primitive binomials. For $\mathbf{x}=\frac{p_{1}}{d_{1}} \mathbf{a}+\frac{p_{2}}{d_{2}}(-\mathbf{b}) \in S_{1}$, we will show that $f_{\mathbf{x}}$ is primitive binomial. On the contrary suppose $f_{\mathbf{x}}$ is not primitive. Then there exists a pure binomial $f_{\mathbf{n}} \in I_{D}$ such that $f_{\mathbf{n}}^{+} \mid f_{\mathbf{x}}^{+}$and $f_{\mathbf{n}}^{-} \mid f_{\mathbf{x}}^{-}$and $\operatorname{supp}\left(\mathbf{n}_{+}\right) \subseteq \operatorname{supp}\left(\mathbf{x}_{+}\right)$, $\operatorname{supp}\left(\mathbf{n}_{-}\right) \subseteq \operatorname{supp}\left(\mathbf{x}_{-}\right)$. If $\operatorname{supp}\left(f_{\mathbf{n}}\right) \subset E(D)$, then by the Proposition 2.6, we get $\operatorname{supp}\left(f_{\mathbf{n}}\right) \subseteq E\left(D_{i}\right)$, for $i=1,2,3$. In fact $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E\left(D_{i}\right), i=1,2,3$. This implies that $f_{\mathbf{n}} \in I_{D_{i}}$. This gives that $f_{\mathbf{n}} \in\left(f_{\mathbf{a}}\right)$ or $\left(f_{-\mathbf{b}}\right)$ or $\left(f_{\mathbf{c}}\right)$. Thus $f_{\mathbf{y}} \mid f_{\mathbf{n}}$ for $\mathbf{y} \in\{\mathbf{a},-\mathbf{b}, \mathbf{c}\}$. This yields that $f_{\mathbf{y}}^{+} \mid f_{\mathbf{n}}^{+}$or $f_{\mathbf{y}}^{-} \mid f_{\mathbf{n}}^{+}$. Thus $f_{\mathbf{y}}^{+} \mid f_{\mathbf{x}}^{+}$or $f_{\mathbf{y}}^{-} \mid f_{\mathbf{x}}^{+}$, for $\mathbf{y} \in\{\mathbf{a},-\mathbf{b}, \mathbf{c}\}$.
This leads to a contradiction because of the following reasons:
if $f_{\mathbf{a}}^{+} \mid f_{\mathbf{x}}^{+}$, then by comparing exponents of $e_{1}$ we get a contradiction. If $f_{\mathbf{a}}^{-} \mid f_{\mathbf{x}}^{+}$, then by comparing the second components of a and $\mathbf{x}$, we get a contradiction. In a similar way, one can drive contradictions for the other two cases.
Therefore $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$. Now we show that $\mathbf{n}$ must be in the form (1). If $\mathbf{n}$ is in the form (2) (or (3)), then by comparing $m_{1}+m_{2}+2$ and $m_{1}+m_{2}+3$ components (or
$m_{1}+1$ and $m_{1}+2$ components in case of form (3)) of $\mathbf{n}$ and $\mathbf{x}$, we get a contradiction to the above support inclusions. Thus $\mathbf{n}$ must be in the form (1). This implies that $\mathbf{e}^{\mathbf{n}_{+}} \mid \mathbf{e}^{\mathbf{x}_{+}}$ and $\mathbf{e}^{\mathbf{n}_{-}} \mid \mathbf{e}^{\mathbf{x}_{-}}$which yields that $\mathbf{n}_{+} \leq \mathbf{x}_{+}$and $\mathbf{n}_{-} \leq \mathbf{x}_{-}$. Since $\operatorname{supp}(\mathbf{a})$ is neither a subset nor a superset of $\operatorname{supp}(\mathbf{b})$, then there exist indices $i_{0}, j_{0}$ such that $[\mathbf{a}]_{i_{0}} \neq 0,[\mathbf{b}]_{i_{0}}=0$ and $[\mathbf{a}]_{j_{0}}=0,[\mathbf{b}]_{j_{0}} \neq 0$. Since $\mathbf{n}_{+} \leq \mathbf{x}_{+}$and $\mathbf{n}_{-} \leq \mathbf{x}_{-}$, this implies that $\frac{p_{i}^{\prime \prime \prime}}{d_{i}}+r_{i} \leq \frac{p_{i}}{d_{i}}$ for $i=1,2$. Since $p_{i}<d_{i}$, this forces that $r_{1}=0=r_{2}$ and $\left(p_{1}^{\prime \prime \prime}, p_{2}^{\prime \prime \prime}\right) \leq\left(p_{1}, p_{2}\right)$. By the minimality of $\mathbf{x}$ in $E_{1}$, this gives that $\left(p_{1}^{\prime \prime \prime}, p_{2}^{\prime \prime \prime}\right)=\left(p_{1}, p_{2}\right)$. Therefore $f_{\mathbf{x}}$ must be primitive. In a similar way, if $\mathbf{n}$ is in the form (2) or (3), then one can prove that $f_{\mathbf{y}}, f_{\mathbf{z}}$ are primitive for $\mathbf{y} \in S_{2}$ and $\mathbf{z} \in S_{3}$ respectively.

Now we show that if $f_{\mathbf{n}} \in I_{D}$ is primitive, then $f_{\mathbf{n}} \in M_{D}$. Let $f_{\mathbf{n}} \in I_{D}$ be a primitive binomial. Suppose $\left|\operatorname{supp}\left(f_{\mathbf{n}}\right)\right|<|E(D)|$. Then $\operatorname{supp}\left(f_{\mathbf{n}}\right) \subseteq E\left(D_{1}\right)$ or $E\left(D_{2}\right)$ or $E\left(D_{3}\right)$. If $\operatorname{supp}\left(f_{\mathbf{n}}\right) \subseteq E\left(D_{1}\right)$, then by the Proposition 2.6, we get that $f_{\mathbf{n}} \in I_{D_{1}}=\left(f_{\mathbf{a}}\right)$. This implies that $f_{\mathbf{a}}^{+} \mid f_{\mathbf{n}}^{+}$and $f_{\mathbf{a}}^{-} \mid f_{\mathbf{n}}^{-}$which implies that $f_{\mathbf{n}}=f_{\mathbf{a}}$ because $f_{\mathbf{n}}$ is primitive. Similarly one can prove for $D_{2}$ and $D_{3}$. Assume $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$.

Suppose $r_{1} \neq 0$. This implies that $\mathbf{n}_{+}>\mathbf{a}_{+}$and $\mathbf{n}_{-}>\mathbf{a}_{-}$. This gives that $\mathbf{e}^{\mathbf{a}_{+}} \mid \mathbf{e}^{\mathbf{n}_{+}}$and $\mathbf{e}^{\mathbf{a}-} \mid \mathbf{e}^{\mathbf{n}_{-}}$which gives that $f_{\mathbf{a}}^{+} \mid f_{\mathbf{n}}^{+}$and $f_{\mathbf{a}}^{-} \mid f_{\mathbf{n}}^{-}$. This is a contradiction to the fact that $f_{\mathbf{n}}$ is primitive. Thus $r_{1}=0$ and similarly $r_{2}=0$. Thus $\mathbf{n}=\frac{p_{1}^{\prime \prime}}{d_{1}} \mathbf{a}+\frac{p_{2}^{\prime \prime}}{d_{2}}(-\mathbf{b})$ and $\left(p_{1}^{\prime \prime}, p_{2}^{\prime \prime}\right) \in E_{1}$. If $\left(p_{1}^{\prime \prime}, p_{2}^{\prime \prime}\right)$ is not minimal, then there exists $\left(p_{1}^{\prime \prime \prime}, p_{2}^{\prime \prime \prime}\right) \in E_{1}$ such that $p_{1}^{\prime \prime \prime}<p_{1}^{\prime \prime}$ or $p_{2}^{\prime \prime \prime}<p_{2}^{\prime \prime}$. Let $\mathbf{x}:=\frac{p_{1}^{\prime \prime \prime}}{d_{1}} \mathbf{a}+\frac{p_{2}^{\prime \prime \prime}}{d_{2}}(-\mathbf{b})$. Then $\mathbf{x} \in \operatorname{Null}(A(D))$ such that $\mathbf{n}_{+}>\mathbf{x}_{+}$and $\mathbf{n}_{-}>\mathbf{x}_{-}$. This gives that $\mathbf{e}^{\mathbf{x}_{+}} \mid \mathbf{e}^{\mathbf{n}_{+}}$and $\mathbf{e}^{\mathbf{x}_{-}} \mid \mathbf{e}^{\mathbf{n}_{-}}$which gives that $f_{\mathbf{x}}^{+} \mid f_{\mathbf{n}}^{+}$and $f_{\mathbf{x}}^{-} \mid f_{\mathbf{n}}^{-}$. This is a contradiction to the fact that $f_{\mathbf{n}}$ is primitive. Therefore $\left(p_{1}^{\prime \prime}, p_{2}^{\prime \prime}\right)$ is minimal. Thus $\mathbf{n} \in S_{1}$. One can prove in a similar way, that if $\mathbf{n}$ is in the form (2) or (3), then $\mathbf{n} \in S_{2}$ or $S_{3}$ by using the similar arguments as above.

Proof of Theorem 3.13. From Theorem 3.11 and Proposition 3.14, we get that $I_{D}$ is strongly robust and $\mathcal{U}_{D}=G r_{D}=M_{D}$.

Below we explicitly compute the unique minimal generating set of $I_{D}$, where $D$ consists of two odd cycles and an unbalanced even cycle sharing a vertex.

Theorem 3.15. Let $D$ be weighted oriented graph consists of two odd cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}$ and an unbalanced even cycle $\mathcal{C}_{m_{3}}$ such that these cycles share only a single vertex as in Notation 3.8. Let $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ are generated by $\left\{f_{\mathbf{a}}\right\},\left\{f_{\mathbf{b}}\right\},\left\{f_{\mathbf{c}}\right\}$ respectively, where $\mathbf{a}=\left((-1)^{i+1} a_{i}\right)_{i=1}^{m_{1}+m_{2}}, \mathbf{b}=\left(\left((-1)^{i} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i} b_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right)$,
$\mathbf{c}=\left(\left((-1)^{i+1} c_{i}\right)_{i=1}^{m_{1}},\left(l_{i} c_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right), l_{i}= \begin{cases}(-1)^{i+1}, & \text { if } r>0 \\ (-1)^{i}, & \text { if } r<0\end{cases}$
Then

$$
\mathcal{U}_{D}=G r_{D}=M_{D}=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}, f_{\mathbf{x}}, f_{\mathbf{y}}, f_{\mathbf{z}}: \mathbf{x} \in S_{1}, \mathbf{y} \in S_{2}, \mathbf{z} \in S_{3}\right\}
$$

where

$$
\begin{aligned}
& S_{1}=\left\{\left(\left((-1)^{i+1} \frac{p_{1}}{d_{1}} a_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i+1}\left(\frac{p_{1}}{d_{1}} a_{i}+\frac{p_{2}}{d_{2}} b_{i}\right)\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{*} \frac{p_{2}}{d_{2}} b_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{1}, p_{2}\right) \in E_{1} \text { is a minimal element in } E_{1}\right\} \text {, } \\
& S_{2}=\left\{\left(\left((-1)^{i+1} \frac{p_{3}}{d_{3}} a_{i}+\frac{p_{4}}{d_{4}} c_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i+1} \frac{p_{3}}{d_{3}} a_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{* *} \frac{p_{4}}{d_{4}} c_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{3}, p_{4}\right) \in E_{2} \text { is a minimal element in } E_{2}\right\} \text {, } \\
& S_{3}=\left\{\left(\left((-1)^{i+1} \frac{p_{6}}{d_{6}} c_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} \frac{p_{5}}{d_{5}} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{* *}\left(\frac{p_{5}}{d_{5}} b_{i}+\frac{p_{6}}{d_{6}} c_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{5}, p_{6}\right) \in E_{3} \text { is a minimal element in } E_{3}\right\} \text {, } \\
& l_{i}^{*}=\left\{\begin{array}{ll}
(-1)^{i+1}, & \text { if } r>0 \\
(-1)^{i}, & \text { if } r<0
\end{array}, \quad l_{i}^{* *}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } r>0 \\
(-1)^{i+1}, & \text { if } r<0
\end{array}, E_{1}, E_{2}, E_{3}, d_{1}, d_{2}, d_{3}, d_{4}, d_{5}, d_{6},\right.\right. \\
& \text { are same as mentioned in Theorem } 3.13 \text { and } r=\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right) \text {. }
\end{aligned}
$$

Proof. Let $f_{\mathbf{n}} \in I_{D}$ be a pure binomial such that $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$. Since $\mathbf{n} \in \operatorname{Null}(A(D))$, using Lemma 2.7, we get that $\mathbf{n}$ is of the following possible forms (with appropriate signs)

$$
\begin{align*}
& \left.\left.\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},(-1)^{i} n_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i+1} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{6}\\
& \left.\left.\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},(-1)^{i} n_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{7}\\
& \left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}+m_{3}} \text { or }  \tag{8}\\
& \left.\quad\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}},(-1)^{i} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}} \tag{9}
\end{align*}
$$

where $n_{i} \in \mathbb{N}$. The element mentioned in (6) can not belong to $\operatorname{Null}(A(D))$ if $r>0$ because if it belongs to $\operatorname{Null}(A(D))$, then from $A(D) \mathbf{n}=0$, we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{1}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{1}}+$ $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{1}}=0$ where $a_{1}, b_{1}, c_{1} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=$ $1,2,3$. Similarly, the element mentioned in (7) can not belong to $\operatorname{Null}(A(D))$ if $r<0$ because if it belongs to $\operatorname{Null}(A(D))$, then from $A(D) \mathbf{n}=0$, we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{2}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{2}}-$ $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{2}}=0$ where $a_{2}, b_{2}, c_{2} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=1,2$ and $\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)<0$.

Since $\operatorname{dim}_{\mathbb{Q}}(\operatorname{Null}(A(D)))=2$, then for any $\mathbf{n} \in \operatorname{Null}(A(D))$, we have that $\mathbf{n}$ is a $\mathbb{Q}$-linear combination of any subset of two linearly independent elements of the set $\{\mathbf{a},-\mathbf{a}, \mathbf{b},-\mathbf{b}, \mathbf{c},-\mathbf{c}\}$ satisfying sign conditions, are described in below table.

|  | Form of $\mathbf{n}$ | $(6)$ | 7 | $(8)$ |
| :--- | :--- | :--- | :--- | :--- |
| $r>0$ | $\times$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a},-\mathbf{b}\}$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ |
| $r<0$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\times$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a},-\mathbf{b}\}$ |

For each case with the possible basis as mentioned in the above table, we proceed as in the proofs of the Proposition 3.14 and the Theorem 3.13 , one can show that the primitive binomials in $I_{D}$ are in the required forms mentioned in the statement and this set is a minimal generating set.

Below we explicitly compute the unique minimal generating set of $I_{D}$, where $D$ consists of an odd cycle and two unbalanced even cycles sharing a vertex.

Theorem 3.16. Let $D$ be weighted oriented graph consists of odd cycle $\mathcal{C}_{m_{1}}$ and two unbalanced even cycles $\mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ such that these cycles share only a single vertex as in Notation 3.8. Let $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ are generated by $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ respectively, where
$\mathbf{a}=\left(\left((-1)^{i+1} a_{i}\right)_{i=1}^{m_{1}},\left(l_{i} a_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}}\right), \mathbf{b}=\left(\left((-1)^{i} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{\prime} a_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right)$,
$\mathbf{c}=\left(\left((-1)^{i+1} b_{i}\right)_{i=1}^{m_{1}},\left(l_{i}^{\prime \prime} a_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right), \quad l_{i}=\left\{\begin{array}{ll}(-1)^{i+1}, & \text { if } q>0 \\ (-1)^{i}, & \text { if } q<0\end{array}\right.$,
$l_{i}^{\prime}=\left\{\begin{array}{ll}(-1)^{i+1}, & \text { if } q r>0 \\ (-1)^{i}, & \text { if } q r<0\end{array}, \quad l_{i}^{\prime \prime}=\left\{\begin{array}{ll}(-1)^{i+1}, & \text { if } r>0 \\ (-1)^{i}, & \text { if } r<0\end{array}\right.\right.$.
Then

$$
\mathcal{U}_{D}=G r_{D}=M_{D}=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}, f_{\mathbf{x}}, f_{\mathbf{y}}, f_{\mathbf{z}}: \mathbf{x} \in S_{1}, \mathbf{y} \in S_{2}, \mathbf{z} \in S_{3}\right\}
$$

where

$$
\begin{aligned}
& S_{1}=\left\{\left(\left((-1)^{i+1} \frac{p_{1}}{d_{1}} a_{i}\right)_{i=1}^{m_{1}},\left(k_{i}^{*}\left(\frac{p_{1}}{d_{1}} a_{i}+\frac{p_{2}}{d_{2}} b_{i}\right)\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{*} \frac{p_{2}}{d_{2}} b_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{1}, p_{2}\right) \in E_{1} \text { is a minimal element in } E_{1}\right\} \text {, } \\
& S_{2}=\left\{\left(\left((-1)^{i+1} \frac{p_{3}}{d_{3}} a_{i}+\frac{p_{4}}{d_{4}} c_{i}\right)_{i=1}^{m_{1}},\left(k_{i}^{* *} \frac{p_{3}}{d_{3}} a_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{* *} \frac{p_{4}}{d_{4}} c_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{3}, p_{4}\right) \in E_{2} \text { is a minimal element in } E_{2}\right\} \text {, } \\
& S_{3}=\left\{\left(\left((-1)^{i+1} \frac{p_{6}}{d_{6}} c_{i}\right)_{i=1}^{m_{1}},\left(k_{i}^{* * *} \frac{p_{5}}{d_{5}} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{* * *}\left(\frac{p_{5}}{d_{5}} b_{i}+\frac{p_{6}}{d_{6}} c_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right):\right. \\
& \left.\left(p_{5}, p_{6}\right) \in E_{3} \text { is a minimal element in } E_{3}\right\} \text {, } \\
& k_{i}^{*}=k_{i}^{* *}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } q<0 \\
(-1)^{i+1}, & \text { if } q>0
\end{array}, \quad k_{i}^{* * *}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } q>0 \\
(-1)^{i+1}, & \text { if } q<0
\end{array},\right.\right. \\
& l_{i}^{*}=\left\{\begin{array}{ll}
(-1)^{i+1}, & \text { if } r<0 \\
(-1)^{i}, & \text { if } r>0
\end{array}, \quad l_{i}^{* *}=l_{i}^{* * *}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } r<0 \\
(-1)^{i+1}, & \text { if } r>0
\end{array},\right.\right. \\
& E_{1}, E_{2}, E_{3}, d_{1}, d_{2}, d_{3}, d_{4}, d_{5}, d_{6} \text {, are same as mentioned in Theorem } 3.13 \text { and } q=\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right) \text {, } \\
& r=\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right) \text {. }
\end{aligned}
$$

Proof. Let $f_{\mathbf{n}} \in I_{D}$ be a pure binomial such that $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$. Since $\mathbf{n} \in \operatorname{Null}(A(D))$, using Lemma 2.7, we get that $\mathbf{n}$ is of the following possible forms (with appropriate signs)

$$
\begin{gather*}
\left.\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} n_{i}\right)\right)_{i=m_{1}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{10}\\
\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i+1} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{11}\\
\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{12}\\
\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}+m_{3}} \tag{13}
\end{gather*}
$$

where $n_{i} \in \mathbb{N}$. The element mentioned in (10) can not belong to $\operatorname{Null}(A(D))$ if $q>0, r>0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{1}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{1}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{1}}=0$ where $a_{1}, b_{1}, c_{1} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=1,2,3$. The element
mentioned in (11) can not belong to $\operatorname{Null}(A(D))$ if $q>0, r<0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{2}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{2}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{2}}=0$ where $a_{2}, b_{2}, c_{2} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=1,2$ and $\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)<0$. The element mentioned in (12) can not belong to $\operatorname{Null}(A(D))$ if $q<0, r>0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{3}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{3}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{3}}=0$ where $a_{3}, b_{3}, c_{3} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=1,3$ and $\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)<0$. The element mentioned in (13) can not belong to $\operatorname{Null}(A(D))$ if $q<0, r<0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{3}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{3}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{3}}=0$ where $a_{3}, b_{3}, c_{3} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)<0$ for $i=2,3$ and $\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)>0$.

Since $\operatorname{dim}_{\mathbb{Q}}(\operatorname{Null}(A(D)))=2$, then for any $\mathbf{n} \in \operatorname{Null}(A(D))$, we have that $\mathbf{n}$ is a $\mathbb{Q}$-linear combination of any subset of two linearly independent elements of the set $\{\mathbf{a},-\mathbf{a}, \mathbf{b},-\mathbf{b}, \mathbf{c},-\mathbf{c}\}$ satisfying sign conditions, are described in the below table.

|  | Form of $\mathbf{n}$ | $\boxed{10}$ | $\sqrt{11}$ | $(12)$ |
| :--- | :--- | :--- | :--- | :--- |
| Case | $\times$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a},-\mathbf{b}\}$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ |
| $q>0, r>0$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a}, \mathbf{b}\}$ | $\checkmark\{-\mathbf{b}, \mathbf{c}\}$ | $\times$ |
| $q<0, r<0$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\times$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a},-\mathbf{b}\}$ |
| $q>0, r<0$ | $\checkmark\{\mathbf{a}, \mathbf{b}\}$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\times$ | $\checkmark\{-\mathbf{b}, \mathbf{c}\}$ |
| $q<0, r>0$ |  |  |  |  |

For each case with the possible basis as mentioned in the above table, we proceed as in the proofs of the Proposition 3.14 and the Theorem 3.13 , one can show that the primitive binomials in $I_{D}$ are in the required forms mentioned in the statement and this set is a minimal generating set.

Below we explicitly compute the unique minimal generating set of $I_{D}$, where $D$ consists of three unbalanced even cycles sharing a vertex.

Theorem 3.17. Let $D$ be weighted oriented graph consists of three unbalanced even $c y$ cles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ such that these cycles share only a single vertex. Let $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ are generated by $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ respectively, where
$\mathbf{a}=\left(\left((-1)^{i+1} a_{i}\right)_{i=1}^{m_{1}},\left(l_{i} a_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}}\right), \mathbf{b}=\left(\left((-1)^{i+1} b_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left(l_{i}^{\prime} a_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right)$, $\mathbf{c}=\left(\left((-1)^{i+1} c_{i}\right)_{i=1}^{m_{1}},\left(l_{i}^{\prime \prime} a_{i}\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right)$,

$$
l_{i}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } p q>0 \\
(-1)^{i+1}, & \text { if } p q<0
\end{array}, \quad l_{i}^{\prime}=\left\{\begin{array}{ll}
(-1)^{i}, & \text { if } q r>0 \\
(-1)^{i+1}, & \text { if } q r<0
\end{array}, \quad l_{i}^{\prime \prime}= \begin{cases}(-1)^{i}, & \text { if } p r>0 \\
(-1)^{i+1}, & \text { if } p r<0\end{cases}\right.\right.
$$

Then

$$
\mathcal{U}_{D}=G r_{D}=M_{D}=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}, f_{\mathbf{x}}, f_{\mathbf{y}}, f_{\mathbf{z}}: \mathbf{x} \in S_{1}, \mathbf{y} \in S_{2}, \mathbf{z} \in S_{3}\right\},
$$

where $k_{i}^{*}=k_{i}^{* *}=\left\{\begin{array}{ll}(-1)^{i}, & \text { if } p q>0 \\ (-1)^{i+1}, & \text { if } p q<0\end{array}, \quad k_{i}^{* * *}=\left\{\begin{array}{ll}(-1)^{i+1}, & \text { if } p q>0 \\ (-1)^{i}, & \text { if } p q<0\end{array}\right.\right.$,
$l_{i}^{*}=\left\{\begin{array}{ll}(-1)^{i+1}, & \text { if } p r>0 \\ (-1)^{i}, & \text { if } p r<0\end{array}, \quad l_{i}^{* *}=l_{i}^{* * *}=\left\{\begin{array}{ll}(-1)^{i}, & \text { if } p r>0 \\ (-1)^{i+1}, & \text { if } p r<0\end{array}\right.\right.$,
$S_{1}, S_{2}, S_{3}, E_{1}, E_{2}, E_{3}, d_{1}, d_{2}, d_{3}, d_{4}, d_{5}, d_{6}$ are same as mentioned in Theorem 3.13 and $p=$ $\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right), q=\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right), r=\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)$.

Proof. Let $f_{\mathbf{n}} \in I_{D}$ be a pure binomial such that $\operatorname{supp}\left(f_{\mathbf{n}}\right)=E(D)$. Since $\mathbf{n} \in \operatorname{Null}(A(D))$, using Lemma 2.7, we get that $\mathbf{n}$ is of the following possible forms (with appropriate signs)

$$
\begin{gather*}
\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}+m_{3}}\right. \text { or }  \tag{14}\\
\left.\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}+m_{2}},\left((-1)^{i} n_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{15}\\
\left.\left.\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} n_{i}\right)\right)_{i=m_{1}+1}^{m_{1}+m_{2}},\left((-1)^{i+1} n_{i}\right)\right)_{i=m_{1}+m_{2}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or }  \tag{16}\\
\left(\left((-1)^{i+1} n_{i}\right)_{i=1}^{m_{1}},\left((-1)^{i} n_{i}\right)_{i=m_{1}+1}^{m_{1}+m_{2}+m_{3}}\right) \text { or } \tag{17}
\end{gather*}
$$

where $n_{i} \in \mathbb{N}$. The element mentioned in (14) can not belong to $\operatorname{Null}(A(D))$ if $p>0, q>$ $0, r>0$ as well as if $p<0, q<0, r<0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{1}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{1}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{1}}=0$ where $a_{1}, b_{1}, c_{1} \in \mathbb{N}$ which is a contradiction in this case. The element mentioned in (15) can not belong to $\operatorname{Null}(A(D))$ if $p>0, q>$ $0, r<0$ as well as if $p<0, q<0, r>0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{2}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{2}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{2}}=0$ where $a_{2}, b_{2}, c_{2} \in \mathbb{N}$ which is a contradiction in this case. The element mentioned in (16) can not belong to $\operatorname{Null}(A(D))$ if $p>0, q<$ $0, r>0$ as well as if $p<0, q>0, r<0$ because if it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{3}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{3}}+\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{3}}=0$ where $a_{3}, b_{3}, c_{3} \in \mathbb{N}$ which is a contradiction as $\operatorname{det}\left(A\left(\mathcal{C}_{m_{i}}\right)\right)>0$ for $i=1,3$ and $\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)<0$. The element mentioned in (17) can not belong to $\operatorname{Null}(A(D))$ if $p>0, q<0, r<0$ as well as if if $p<0, q>0, r>0$ because if
it belongs to $\operatorname{Null}(A(D))$, then we get $\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{1}}\right)\right)}{a_{4}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{2}}\right)\right)}{b_{4}}-\frac{\operatorname{det}\left(A\left(\mathcal{C}_{m_{3}}\right)\right)}{c_{4}}=0$ where $a_{4}, b_{4}, c_{4} \in \mathbb{N}$ which is a contradiction in this case.
Since $\operatorname{dim}_{\mathbb{Q}}(\operatorname{Null}(A(D)))=2$, then for any $\mathbf{n} \in \operatorname{Null}(A(D))$, we have that $\mathbf{n}$ is a $\mathbb{Q}$-linear combination of any subset of two linearly independent elements of the set $\{\mathbf{a},-\mathbf{a}, \mathbf{b},-\mathbf{b}, \mathbf{c},-\mathbf{c}\}$ satisfying sign conditions, are described in the below table.

| Form of $\mathbf{n}$ <br> Case | (14) | (15) | (16) | (17) |
| :---: | :---: | :---: | :---: | :---: |
| $p>0, q>0, r>0$ | $\times$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\checkmark\{\mathrm{a},-\mathrm{b}\}$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ |
| $p<0, q<0, r<0$ |  |  |  |  |
| $p>0, q>0, r<0$ | $\checkmark\{\mathbf{b}, \mathbf{c}\}$ | $\times$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\checkmark\{\mathrm{a},-\mathrm{b}\}$ |
| $p<0, q<0, r>0$ |  |  |  |  |
| $p>0, q<0, r>0$ | $\checkmark\{\mathbf{a}, \mathrm{b}\}$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\times$ | $\checkmark\{-\mathrm{b}, \mathrm{c}\}$ |
| $p<0, q>0, r<0$ |  |  |  |  |
| $p>0, q<0, r<0$ | $\checkmark\{\mathbf{a}, \mathbf{c}\}$ | $\checkmark\{\mathbf{a}, \mathbf{b}\}$ | $\checkmark\{-\mathrm{b}, \mathrm{c}\}$ | $\times$ |
| $p<0, q>0, r>0$ |  |  |  |  |

For each case with the possible basis as mentioned in the above table, we proceed as in the proofs of the Proposition 3.14 and the Theorem 3.13 , one can show that the primitive binomials in $I_{D}$ are in the required forms mentioned in the statement and this set is a minimal generating set.

Example 3.18. Let $D$ be a weighted oriented graph as shown in the below diagram consists of three odd cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ that share a vertex as in Notation 3.8. Let $w_{i}$ be the weight of vertex $v_{i}$. Assume that $w_{1}=2, w_{2}=2, w_{3}=3, w_{5}=3, w_{6}=4, w_{8}=2, w_{9}=4$. Also,

$I_{D_{1}}=\left(f_{\mathbf{a}}\right), I_{D_{2}}=\left(f_{\mathbf{b}}\right), I_{D_{3}}=\left(f_{\mathbf{c}}\right)$, where

$$
\begin{aligned}
& \mathbf{a}=(25,50,150,13,39,156,0,0,0) \\
& \mathbf{b}=(0,0,0,17,51,204,25,50,200) \\
& \mathbf{c}=(17,34,102,0,0,0,13,26,104)
\end{aligned}
$$

Then according to the notation of the Theorem 3.13, we have $d_{1}=d_{2}=25, d_{3}=d_{4}=$ $13, d_{5}=d_{6}=17$ and
$E_{1}=\{(1,11),(3,8),(5,5),(7,2),(16,1),(2,22),(4,19),(6,16),(8,13),(9,24),(10,10)$, $(11,21),(12,7),(13,18),(14,4),(15,15),(17,12),(18,23),(19,9),(20,20),(21,6)$, $(22,17),(23,3),(24,14)\}$,
$E_{2}=\{(1,10),(2,7),(3,4),(4,1),(5,11),(6,8),(7,5),(8,2),(9,12),(10,9),(11,6),(12,3)\}$,
$E_{3}=\{(1,2),(9,1),(2,4),(3,6),(4,8),(5,10),(6,12),(7,14),(8,16),(10,3),(11,5),(12,7)$, $(13,9),(14,11),(15,13),(16,15)\}$.

The sets of minimal elements in $E_{1}, E_{2}, E_{3}$ are

$$
\{(1,11),(3,8),(5,5),(7,2),(16,1)\},\{(1,10),(2,7),(3,4),(4,1)\},\{(1,2),(9,1)\}
$$

respectively. Thus $\left|G r_{D}\right|=\left|\mathcal{U}_{D}\right|=\left|M_{D}\right|=3+\left|S_{1}\right|+\left|S_{2}\right|+\left|S_{3}\right|=3+5+4+2=14$.
If $D$ is weighted oriented graph consists of two balanced cycles share a path, then $I_{D}$ need not be generalized robust. Below we provide an example.

Example 3.19. Consider the following weighted oriented graph consists of two even cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ that share a path of length 1 . Let $w_{i}$ be the weight of vertex $v_{i}$.

Here $m=n=4$. If $w_{1}=w_{2}=w_{3}=w_{7}=2$, then above cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ are balanced. Also, $I_{\mathcal{C}_{m}}=\left(f_{\mathbf{a}}\right), I_{\mathcal{C}_{n}}=\left(f_{\mathbf{b}}\right), I_{\mathcal{C}}=\left(f_{\mathbf{c}}\right)$ where $\mathbf{a}=(2,2,1,1,0,0,0), \mathbf{b}=$ $(1,0,0,0,2,2,1), \mathbf{c}=(0,2,1,1,4,4,1)$. Using Macaulay-2, we compute $I_{D}=\left(f_{\mathbf{a}}, f_{\mathbf{b}}\right)$.

Let $A$ be any minimal generating set of $I_{D}$. Then there exists $f \in A$ such that $f^{+} \mid f_{\mathbf{a}}^{+}$. If $\operatorname{supp}(f)=E\left(\mathcal{C}_{n}\right)$ or $E(D) \backslash\left\{e_{1}\right\}$ or $E(D)$, then we arrive at a contradiction as in this case $\operatorname{supp}\left(f^{+}\right) \nsubseteq \operatorname{supp}\left(f_{\mathbf{a}}^{+}\right)$. Thus supp $(f)=E\left(\mathcal{C}_{m}\right)$. Then using arguments as in Theorem 3.11, we get $f^{-} \mid f_{\mathbf{a}}^{-}$. This implies that $f$ and $f_{\mathbf{a}}$ are associates as $f_{\mathbf{a}}$ is primitive binomial. This proves that $f_{a}$ is indispensable binomial. Similarly, we can show that $f_{b}$ is indispensable binomial. As $\left\{f_{\mathbf{a}}, f_{\mathbf{b}}\right\}$ is generating set of $I_{D}$, it is unique minimal generating set of $I_{D}$ i.e $\mathcal{M}_{D}=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}\right\}$. Using Macaulay-2 [6], we get $B=\left\{f_{\mathbf{a}}, f_{\mathbf{b}}, e_{2}^{2} e_{4} e_{6}^{2}-e_{1} e_{3} e_{5}^{2} e_{7}\right\}$ is Gröbner basis of $I_{D}$. We see that $B \neq \mathcal{M}_{D}$. Thus $\mathcal{U}_{D} \neq \mathcal{M}_{D}$. Hence $I_{D}$ is not generalized robust. This implies that $I_{D}$ is not robust and not strongly robust.

Notation 3.20. Let $D$ be weighted oriented graph consists of two cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ share a vertex. Let $V\left(\mathcal{C}_{m}\right)=\left\{v_{1}, \ldots, v_{m}\right\}, V\left(\mathcal{C}_{n}\right)=\left\{v_{1}, v_{m+2} \ldots, v_{m+n}\right\}$ under convention $v_{m+1}=v_{m+n+1}=v_{1}, e_{i}$ be the edge incident with $v_{i}$ and $v_{i+1}$ for $i=1,2, \ldots, m+n$.

Below we recall the results from [16] which are used in the proofs of main results.
Theorem 3.21. [16, Theorem 4.7] Let $D$ be weighted oriented graph consists of two odd cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ as in above notation 3.20. Then the toric ideal $I_{D}$ is generated by

$$
\begin{aligned}
& \prod_{i=1, \text { odd }}^{m+n} e_{i}^{\frac{a_{i}}{d}}-\prod_{i=1, \text { even }}^{m+n} e_{i}^{\frac{a}{i}^{d}}, \text { where } \\
a_{1} & =\alpha_{2} \alpha_{3} \ldots \alpha_{m}|p|, \\
a_{i} & =\alpha_{2}^{\prime} \alpha_{3}^{\prime} \ldots \alpha_{i}^{\prime} \alpha_{i+1} \ldots \alpha_{m}|p|, i=2,3, \ldots, m-1, \\
a_{m} & =\alpha_{2}^{\prime} \alpha_{3}^{\prime} \ldots \alpha_{m}^{\prime}|p|, \\
a_{m+1} & =\alpha_{m+2} \alpha_{m+3} \ldots \alpha_{m+n}|q| \\
a_{m+i} & =\alpha_{m+2}^{\prime} \ldots \alpha_{m+i}^{\prime} \alpha_{m+i+1} \ldots \alpha_{m+n}|q|, i=2, \ldots, n-1, \\
a_{m+n} & =\alpha_{m+2}^{\prime} \alpha_{m+3}^{\prime} \ldots \alpha_{m+n}^{\prime}|q| \\
p & =\operatorname{det}\left(A\left(\mathcal{C}_{n}\right)\right) \\
q & =\operatorname{det}\left(A\left(\mathcal{C}_{m}\right)\right), \\
d & =g c d\left(a_{i}\right)_{i=1}^{m+n}, \\
\operatorname{det}\left(A\left(\mathcal{C}_{n}\right)\right) & =\alpha_{m+2} \alpha_{m+3} \ldots \alpha_{m+n} \alpha_{1, m+1}+(-1)^{n+1} \alpha_{m+2}^{\prime} \alpha_{m+3}^{\prime} \alpha_{m+4}^{\prime} \ldots \alpha_{m+n}^{\prime} \alpha_{1, m+n}, \\
\operatorname{det}\left(A\left(\mathcal{C}_{m}\right)\right) & =\alpha_{1} \alpha_{2} \alpha_{3} \ldots \alpha_{m}+(-1)^{m+1} \alpha_{2}^{\prime} \alpha_{3}^{\prime} \alpha_{4}^{\prime} \ldots \alpha_{m}^{\prime} \alpha_{1, m}
\end{aligned}
$$

$$
\begin{aligned}
\alpha_{k}^{\prime} & =\left\{\begin{array}{l}
1, \\
w_{k}, \\
\text { if } v_{k} \text { is tail of } e_{k-1}, \\
{\text { s head of } e_{k-1}},
\end{array}, \quad \alpha_{j}= \begin{cases}1, & \text { if } v_{j} \text { is tail of } e_{j}, \\
w_{j}, & \text { if } v_{j} \text { is head of } e_{j},\end{cases} \right. \\
\alpha_{1, k} & =\left\{\begin{array}{l}
1, \text { if } v_{1} \text { is tail of } e_{k}, \\
w_{1}, \text { if } v_{1} \text { is head of } e_{k},
\end{array}\right.
\end{aligned}
$$

Theorem 3.22. [16, Theorem 4.9] Let $D$ be weighted oriented graph consists of two even unbalanced cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ as in above Notation 3.20. Then the toric ideal $I_{D}$ is generated by
(1) $\prod_{i=1, o d d}^{m} e_{i}^{\frac{a_{i}}{d}} \prod_{i=m+1, \text { even }}^{m+n} e_{i}^{\frac{a_{i}}{d}}-\prod_{i=1, \text { even }}^{m} e_{i}^{\frac{a_{i}}{d}} \prod_{i=m+1, \text { odd }}^{m+n} e_{i}^{\frac{a_{i}}{d}}$ if $p q>0$
(2) $\prod_{i=1, \text { odd }}^{m+n} e_{i}^{\frac{a_{i}}{d}}-\prod_{i=1, \text { even }}^{m+n} e_{i}^{\frac{a_{i}}{d}}$ if $p q<0$
where $a_{i}, d, p$ are same as in Theorem 3.13.

Lemma 3.23. Let $\mathcal{C}_{m}$ be a weighted oriented even cycle. If $V^{+}$are sinks, then $\mathcal{C}_{m}$ is balanced and exponent of each variable into irreducible generator of $I_{\mathcal{C}_{m}}$ is 1 .

Proof. Since main-diagonal and off-diagonal entries of each row of incidence matrix corresponding to source vertex as well as non-source non-sink vertex are 1 and main-diagonal and off-diagonal entries of each row of incidence matrix corresponding to sink are its weight, determinant of its incidence matrix is zero and $\mathbf{x}=(1,-1,1,-1, \ldots, 1,-1)^{T} \in$ $\operatorname{Null}\left(A\left(\mathcal{C}_{m}\right)\right.$. This implies that the corresponding binomial of $\mathbf{x}$, is the required generator of $I_{\mathcal{C}_{m}}$.

Lemma 3.24. Let $D$ be weighted oriented graph consists of unbalanced cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ share a vertex such that $V^{+}$are sinks. Then $\mathcal{C}_{m}, \mathcal{C}_{n}$ are odd cycles and exponent of each variable in $f_{\mathbf{c}_{\mathbf{m}} \cup \mathbf{c}_{\mathbf{n}}}$ is 1 .

Proof. By using Lemma 3.23, we get that $\mathcal{C}_{m}, \mathcal{C}_{n}$ are odd cycles. We use notation as in Theorem3.21. Let $v_{1}$ be the sharing vertex and $w_{i}$ denotes weight corresponding to vertex $v_{i}$. Then $\alpha_{j}=\alpha_{j}^{\prime}=\left\{\begin{array}{ll}1, & \text { if } v_{j} \text { is not } \operatorname{sink} \text { of } D, \\ w_{j}, & \text { if } v_{j} \text { is sink of } D,\end{array}\right.$ for $j=2,3, \ldots, m, m+2, \ldots, m+n$. Also, $p=2 \prod_{v_{i} \text { is } \operatorname{sink} \text { of } \mathcal{C}_{n}} w\left(v_{i}\right)$ and $q=2 \prod_{v_{j} \text { is } \operatorname{sink} \text { of } \mathcal{C}_{m}} w\left(v_{j}\right)$. Using Theorem 3.13,
$a_{i}=\left\{\begin{array}{cl}2 \prod_{v_{i}} \text { is sink of } \mathcal{C}_{1} w_{i} \prod_{v_{j}} \text { is } \prod_{i n k} w_{j} & \text { if } v_{1} \text { is not } \operatorname{sink} \text { of } D \\ 2 w_{1} \prod_{\mathcal{C}_{2}} \text { is sink of } \mathcal{C}_{1} w_{i} \prod_{v_{j}} \text { is sink of } \mathcal{C}_{2}\end{array} \quad w_{j} \quad\right.$ if $v_{1}$ is $\operatorname{sink}$ of $D ~ \$$ for each $i=1,2, \ldots, m+n$.

Hence, exponent of each variable in $f_{\mathbf{c}_{\mathbf{m}} \cup \mathbf{c}_{\mathbf{n}}}$ is 1 .
Corollary 3.25. Let $D$ be a weighted oriented graph consists of unbalanced cycles $\mathcal{C}_{1}, \mathcal{C}_{2}, \mathcal{C}_{3}$ sharing a vertex such that $V^{+}$are sinks. Then $I_{D}=\left(f_{\mathbf{c}_{1} \cup \mathbf{c}_{2}}, f_{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{3}}, f_{\mathbf{c}_{\mathbf{2}} \cup \mathbf{c}_{\mathbf{3}}}\right)$.

Proof. Using the Lemma 3.24, Theorem 3.13 and according to the notation of this theorem, $d_{1}=d_{2}=d_{3}=d_{4}=d_{5}=d_{6}=1$ and hence $E_{1}=E_{2}=E_{3}=\emptyset$. This implies the result follows.

Lemma 3.26. Let $D$ be a weighted oriented graph consists of two naturally oriented odd cycles $\mathcal{C}_{m}, \mathcal{C}_{n}\left(\right.$ or unbalanced even cycles $\left.\mathcal{C}_{m}, \mathcal{C}_{n}\right)$ sharing only a single vertex and $\prod_{v \in V\left(\mathcal{C}_{m}\right)} w(v)=\prod_{v \in V\left(\mathcal{C}_{n}\right)} w(v)$. Then the irreducible generator of $I_{D}$ has exponents of at least one variable from the edge set $E\left(\mathcal{C}_{m}\right)$ and at least one variable from the edge set $E\left(\mathcal{C}_{n}\right)$ are equal to 1.

Proof. We use notation as in Theorems 3.21 or 3.22 . Since cycles are naturally oriented, without loss of any generality, we can assume that $e_{1}=\left(v_{1}, v_{2}\right), e_{m+1}=\left(v_{1}, v_{m+2}\right)$.
In this case, $\alpha_{i}=1$ for $i=2,3, \ldots, m, m+2, m+3 \ldots, m+n$,
$p= \begin{cases}1+\prod_{v \in V\left(\mathcal{C}_{n}\right)} w(v), & \text { if } n \text { odd, }, \\ 1-\prod_{v \in V\left(\mathcal{C}_{n}\right)} w(v), & \text { if } n \text { even, },\end{cases}$

$$
q=\left\{\begin{array}{ll}
1+\prod_{v \in V\left(\mathcal{C}_{m}\right)} w(v), & \text { if } n \text { odd, } \\
1-\prod_{v \in V\left(\mathcal{C}_{m}\right)} w(v), & \text { if } n \text { even, }
\end{array}, a_{1}=\right.
$$

$a_{m+1}=|p|=|q|$ and $|p| \mid a_{i}$ for any $i=1,2, \ldots, m+n$. Thus $d=|p|=|q|$. Therefore using Theorem 3.13 or 3.16, exponents of $e_{1}, e_{m+1}$ are 1 .

Corollary 3.27. Let $D$ be weighted oriented graph consists of three naturally oriented odd cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ (or unbalanced even cycles $\mathcal{C}_{m_{1}}, \mathcal{C}_{m_{2}}, \mathcal{C}_{m_{3}}$ ) sharing only a single vertex as in Notation 3.8. Suppose $\prod_{v \in V\left(\mathcal{C}_{m_{1}}\right)} w(v)=\prod_{v \in V\left(\mathcal{C}_{m_{2}}\right)} w(v)=\prod_{v \in V\left(\mathcal{C}_{m_{3}}\right)} w(v)$. Then minimum generating set of $I_{D}$ is precisely the set of three irreducible generators corresponding to $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ respectively.

Proof. Let $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ be irreducible generators of $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ respectively. Then using Lemma 3.26 and using Theorems 3.13 or 3.17, notation as in these theorems), $d_{1}=d_{2}=$ $d_{3}=d_{4}=d_{5}=d_{6}=1$. Hence, $E_{1}=E_{2}=E_{3}=\emptyset$ and this completes the proof.

Lemma 3.28. Let $D$ be a weighted oriented graph consists of unbalanced cycles $\mathcal{C}_{m}, \mathcal{C}_{n}$ share a vertex $v_{1}$ such that $\mathcal{C}_{m}$ has only one non-source non-sink vertex $x$ and $\mathcal{C}_{n}$ has only one non-source non-sink vertex $y$ such that $w(x)=w(y)$ and the sharing vertex is either sink of $D$ or is not sink of any cycle or the weight of this vertex is 1 . Then both cycles are odd and the exponent of at least one variable corresponding to edge set of each cycle in irreducible generator of $I_{D}$ is 1 .

Proof. As in a cycle graph, the number of sources is equal to the number of sinks and each of the given cycles has only one non-source non-sink vertex, each of them is odd cycle.

We use notation as in Theorem 3.21. If $v_{i}$ is non-source non-sink vertex of cycles $\mathcal{C}_{m}$ or $\mathcal{C}_{n}$ incident with edges $e_{j-1}$ and $e_{j}$, then without loss of any generality, we can assume that $v_{i}$ is head of $e_{j-1}$ and $v_{i}$ is tail of $e_{j}$. Let $w_{i}$ denotes weight corresponding to vertex $v_{i}$ and $w(x)=w(y)=w$. We get $p=(1+w) \quad \prod_{\quad} w\left(v_{i}\right)$ and $v_{i}$ is sink of $\mathcal{C}_{n}$ $q=(1+w) \prod_{v_{j} \text { is sink of } \mathcal{C}_{m}} w\left(v_{j}\right)$, We use Theorem 3.21. Now, we have the following casess :
Case 1: Suppose $v_{i}\left(\neq v_{1}\right)$ is non-source non-sink vertex of $\mathcal{C}_{m}$ and $v_{m+1}$ is non-source nonsink vertex of $\mathcal{C}_{n}$. Then $\alpha_{i}^{\prime}=w, \alpha_{i}=1$ and $a_{i-1}=\quad \prod \quad w\left(v_{i}\right) \quad \prod \quad w\left(v_{i}\right)(1+$ $v_{i}\left(\neq v_{1}\right)$ sink of $\mathcal{C}_{m} \quad v_{i}$ sink of $\mathcal{C}_{n}$ $w), a_{j}=a_{i-1}, a_{k}=w a_{i-1}$ for $1 \leq j<i-1, k \geq i, a_{m+j}=a_{i-1}$ for $j=1,2, \ldots, n$. Thus $d=a_{i-1}$ and exponents of $e_{i}$ in irreducible generator of $I_{D}$ is 1 for $i=1,2, \ldots, i-1, m+$ $1, \ldots, m+n$.
Case 2: Suppose $v_{i}\left(\neq v_{1}\right)$ is non-source non-sink vertex of $\mathcal{C}_{m}$ and $v_{j}\left(\neq v_{m+1}\right)$ is nonsource non-sink vertex of $\mathcal{C}_{n}$. Using arguments like in Case 1, exponents of $e_{i}$ in irreducible generator of $I_{D}$ is 1 for $i=1,2, \ldots, i-1, j-1, \ldots, m+n$.
Case 3: Suppose $v_{1}$ is non-source non-sink vertex of $\mathcal{C}_{m}$ and $v_{m+1}$ is non-source non-sink vertex of $\mathcal{C}_{n}$. Using arguments like in Case 1 , exponents of $e_{i}$ in irreducible generator of $I_{D}$ is 1 for $i=1,2, \ldots, m+n$.

Corollary 3.29. Let $D$ be a weighted oriented graph consists of three unbalanced cycles share a vertex as in Notation 3.8 such that each cycle has only one non-source non-sink vertex with same weight and the sharing vertex is either sink of $D$ or is not sink of any
cycle or the weight of this vertex is 1 . Then minimum generating set of $I_{D}$ is precisely the set of three irreducible generators corresponding to $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$.

Proof. Let $f_{\mathbf{a}}, f_{\mathbf{b}}, f_{\mathbf{c}}$ be irreducible generators of $I_{D_{1}}, I_{D_{2}}, I_{D_{3}}$ respectively. Then using Lemma 3.28 and using Theorem 3.13 ( notation as in this theorem), $d_{1}=d_{2}=d_{3}=d_{4}=$ $d_{5}=d_{6}=1$. Hence, $E_{1}=E_{2}=E_{3}=\emptyset$ and this completes the proof.

## 4. Circuit binomials and Strongly robustness of toric ideals

In this section, first we characterize the circuit binomials in any WOG. If $D$ consists of $n$ oriented cycles sharing a vertex such that at most two among these cycles are unbalanced, then we show that $\mathcal{C}_{D}$ is a generating set of $I_{D}$ and hence $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$. We characterize primitive binomials of a WOG consists of $n$ unbalanced cycles sharing a vertex. First we fix the below notation.

Notation 4.1. For a balanced cycle $\mathcal{C}_{i}$, we know that its toric ideal $I_{\mathcal{C}_{i}}$ is generated by a single primitive binomial, say $f_{\mathbf{c}_{\mathbf{i}}}$, where $\mathbf{c}_{\mathbf{i}} \in \operatorname{Null}\left(A\left(\mathcal{C}_{i}\right)\right)$. For two unbalanced cycles $\mathcal{C}_{i}, \mathcal{C}_{j}$ sharing a vertex, the toric ideal of $\mathcal{C}_{i} \cup \mathcal{C}_{j}$ is principal and generated by a primitive binomial, say $f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}$, where $\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}$ is a vector in $\operatorname{Null}\left(A\left(\mathcal{C}_{i} \cup \mathcal{C}_{j}\right)\right)$. Let $f_{\mathbf{c}_{\mathbf{i}} \mathbf{p}_{\mathbf{k}} \mathbf{c}_{\mathbf{j}}}$ denotes the primitive binomial which is the generator of toric ideal of unbalanced cycles $\mathcal{C}_{i}$ and $\mathcal{C}_{j}$ share a path $P_{k}$ such that the cycle whose edge set is $E\left(\mathcal{C}_{i} \cup \mathcal{C}_{j}\right) \backslash E\left(P_{k}\right)$ is unbalanced. Also, $f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{p}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}}$ denotes the primitive binomial which is the generator of toric ideal of the WOG of unbalanced cycles $\mathcal{C}_{i}$ and $\mathcal{C}_{j}$ that are connected by a path $P_{k}$ (such a toric ideal is principal by [2, Theorem 5.1]).

Proposition 4.2. For any weighted oriented graph D, the set of all circuit binomials in $I_{D}$ is given by
$\mathcal{C}_{D}=\left\{f_{\mathbf{c}}, f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}, f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{p}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}}, f_{\mathbf{c}_{\mathbf{i}} \mathbf{p}_{\mathbf{k}} \mathbf{c}_{\mathbf{j}}}: \mathcal{C}\right.$ is balanced, $P_{k}$ is path, $\mathcal{C}_{i}, \mathcal{C}_{j}$ are unbalanced in $\left.D\right\}$.
Proof. Let $A=\left\{f_{\mathbf{c}}, f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}, f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{p}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}}, f_{\mathbf{c}_{\mathbf{i}} \mathbf{p}_{\mathbf{k}} \mathbf{c}_{\mathbf{j}}}: \mathcal{C}\right.$ is balanced, $P_{k}$ is path, $\mathcal{C}_{i}, \mathcal{C}_{j}$ are unbalanced in $D\}$. It is easy to see that $A \subseteq \mathcal{C}_{D}$. Let $f \in \mathcal{C}_{D}$ such that $\operatorname{supp}(f)$ contains more than three cycles. Then either $\operatorname{supp}\left(f_{\mathbf{c}}\right) \varsubsetneqq \operatorname{supp}(f)$ or $\operatorname{supp}\left(f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}\right) \varsubsetneqq \operatorname{supp}(f)$ or $\operatorname{supp}\left(f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{p}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}}\right)$ $\varsubsetneqq \operatorname{supp}(f)$ or $\operatorname{supp}\left(f_{\mathbf{c}_{\mathbf{i}} \mathbf{p}_{\mathbf{k}} \mathbf{c}_{\mathbf{j}}}\right) \varsubsetneqq \operatorname{supp}(f)$, where $\operatorname{supp}(f)$ strictly contains edge set of a balanced cycle or two unbalanced cycles or three unbalanced cycles. This is a contradiction because $f$ is a circuit binomial. Thus $\operatorname{supp}(f)$ contains precisely edge set of one balanced
cycle or two unbalanced cycles or three unbalanced cycles. Hence $f \in \mathcal{C}_{D}$. This completes the proof.

Proposition 4.3. Let $D$ be a weighted oriented graph such that $I_{D}$ is strongly robust. If $\mathcal{C}_{D}$ is a generating set of $I_{D}$, then $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proof. As $I_{D}$ is strongly robust and $\mathcal{C}_{D} \subseteq G r_{D}$, then $\mathcal{C}_{D} \subseteq M_{D}$. Thus if $\mathcal{C}_{D}$ is generating set of $I_{D}$, then $\mathcal{C}_{D}$ is a minimal generating set of $I_{D}$, that is, $\mathcal{C}_{D}=\mathcal{M}_{D}$. Since $I_{D}$ is strongly robust, $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proposition 4.4. Let $D$ be weighted oriented graph consists of certain number of balanced cycles share a vertex. Then $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proof. Using [16, Theorem 3.1], we have that $\mathcal{C}_{D}$ is a generating set of $I_{D}$. Thus the result follows from the Theorem 3.11 and Proposition 4.3 .

Proposition 4.5. Let $D=\mathcal{C}_{1} \cup \ldots \cup \mathcal{C}_{n}$ be a weighted oriented graph such that $\mathcal{C}_{1}, \ldots, \mathcal{C}_{n}$ are oriented cycles share a vertex, $\mathcal{C}_{1}$ is unbalanced and $\mathcal{C}_{2}, \ldots, \mathcal{C}_{n}$ are balanced. Then $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proof. Let $f \in G r_{D} \backslash \mathcal{C}_{D}$. Then using Lemma 3.10, supp $(f)$ can not contain edge set of any balanced cycle. This implies that $\operatorname{supp}(f) \subseteq E\left(\mathcal{C}_{1}\right)$. Therefore $f \in I_{\mathcal{C}_{1}}=(0)$ and hence $f=0$. This is a contradiction. Thus $G r_{D}=\mathcal{C}_{D}$ and as $I_{D}$ is strongly robust, $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proposition 4.6. Let $D$ be a weighted oriented graph consists of balanced cycles $\mathcal{C}_{1}, \mathcal{C}_{2}, \ldots$, $\mathcal{C}_{n-2}$ and unbalanced cycles $\mathcal{C}_{n-1}, \mathcal{C}_{n}$ share a vertex. Then $\mathcal{C}_{D}=\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}$.

Proof. By the Lemma 3.9, we have $I_{D}$ is generated by $G r_{D}$. To show that $\mathcal{C}_{D}=G r_{D}$. Suppose there exists $f \in G r_{D} \backslash \mathcal{C}_{D}$. If $\operatorname{supp}(f)$ contains edge set of one balanced cycle $\mathcal{C}$, then using Lemma 3.10, $f_{\mathbf{c}}^{+} \mid f^{+}$and $f_{\mathbf{c}}^{-} \mid f^{-}$which is a contradiction as $f \in G r_{D} \backslash \mathcal{C}_{D}$. Thus supp $(f)$ contains precisely edge set of unbalanced cycles $\mathcal{C}_{n-1}, \mathcal{C}_{n}$. This implies that $f_{\mathbf{c}_{\mathbf{n}-1} \cup \mathbf{c}_{\mathbf{n}}}^{+} \mid f^{+}$and $f_{\mathbf{c}_{\mathbf{n}-1} \cup \mathbf{c}_{\mathbf{n}}}^{-} \mid f^{-}$which is a contradiction as $f \in G r_{D} \backslash \mathcal{C}_{D}$. Thus $G r_{D}=\mathcal{C}_{D}$. As $I_{D}$ is strongly robust, $M_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.

Proposition 4.7. Let $D$ be a weighted oriented graph consists of $n$ cycles share a vertex such that every vertex of $D$ is either source or sink. Then every cycle in $D$ is even balanced cycle and $\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.

Proof. As every vertex of $D$ is either source or sink, if $D$ has any odd cycle, then that odd cycle has non-source non-sink vertex. Thus $D$ can not have any odd cycles. Then every cycle in $D$ is even and balanced. Hence using Lemma 3.10 and as $I_{D}$ is strongly robust, it follows.

Theorem 4.8. Let $D$ be weighted oriented graph consists of $n$ unbalanced cycles $\mathcal{C}_{1}, \ldots, \mathcal{C}_{n}$ share a common vertex. Let $I_{\mathcal{C}_{i} \cup \mathcal{C}_{j}}=\left(f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}\right)$, for some vector $\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}} \in \operatorname{Null}(A(D))$ with integer entries, for all $i, j$. Let $\mathbf{m} \in \operatorname{Null}(A(D)) \cap \mathbb{Z}^{|E(D)|}$. Suppose $f_{\mathbf{m}}$ is a primitive binomial in $I_{D}$ such that $\operatorname{supp}\left(f_{\mathbf{m}}\right)=E(D)$. Then there exists a cycle $\mathcal{C}_{k}$ depending on $\mathbf{m}$ such that $\mathbf{m}$ is of the following form

$$
\mathbf{m}=\sum_{r \in X}\left(\frac{p_{r}}{d_{r}}+k_{r}\right)\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)+\sum_{r \notin X}\left(\frac{p_{r}}{d_{r}}-k_{r}\right)\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right),
$$

where $X=\left\{r:\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \prec \mathbf{m}\right\}$, such that $\left.\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)\right|_{E\left(\mathcal{C}_{k}\right)} \prec \mathbf{m}$, $\sum_{r \in X}\left(\frac{p_{r}}{d_{r}}+k_{r}\right)\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{j}+\sum_{r \notin X}\left(\frac{p_{r}}{d_{r}}-k_{r}\right)\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{j} \in \mathbb{Z}$, for $e_{j} \in E\left(\mathcal{C}_{k}\right)$, where $d_{r}=\operatorname{gcd}\left(\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{j}: e_{j} \in E\left(\mathcal{C}_{r}\right)\right), 0 \leq p_{r}<d_{r}, k_{r} \in \mathbb{N} \cup\{0\}$.

Proof. Fix an arbitrary cycle $\mathcal{C}_{k}$ from $D$. Let $A=\left\{\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{1}}: \mathcal{C}_{l}\right.$ is cycle in $\left.D\right\}$. Since $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}(A(D))=n-1$ and $A$ is linearly independent set containing $n-1$ elements, therefore $A$ is a basis of $\operatorname{Null}(A(D))$. Let $\mathbf{m}=\sum_{\mathcal{C}_{i} \in D} \mu_{i}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)$, for some $\mu_{i} \in \mathbb{Q}$. Without loss of generality, we can assume that $\left.\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)\right|_{E\left(\mathcal{C}_{k}\right)} \prec \mathbf{m}$, for each cycle $\mathcal{C}_{l}$ in $D$.

Now we prove that there exists a cycle $\mathcal{C}_{j}$ such that $\left.\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}\right)\right|_{E\left(\mathcal{C}_{j}\right)} \prec \mathbf{m}$. Suppose not, that is, $\left.\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)\right|_{E\left(\mathcal{C}_{l}\right)} \nprec \mathbf{m}$ for each cycle $\mathcal{C}_{l}$ in $D$. This implies that $t \in \operatorname{supp}\left(\mathbf{m}_{+}\right) \cap$ $\operatorname{supp}\left(\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)_{-}\right)$or $t \in \operatorname{supp}\left(\mathbf{m}_{-}\right) \cap \operatorname{supp}\left(\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)_{+}\right)$for $e_{t} \in E\left(\mathcal{C}_{l}\right)$. Since $[\mathbf{m}]_{t}=$ $\sum_{l} \mu_{l}\left[\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)\right]_{t}=\mu_{l}\left[\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{l}}\right)\right]_{t}$, for all $t \in E\left(\mathcal{C}_{l}\right)$, we get that $\mu_{l}<0$. Thus we have $\mu_{l}<0$ for all $l \neq k$. This implies that $t \in \operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\mathbf{m}_{-}\right)$for $e_{t} \in E\left(\mathcal{C}_{k}\right)$ which is a contradiction because $\operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\mathbf{m}_{-}\right)=\emptyset$. Thus there exists a cycle $\mathcal{C}_{j}$ such that $\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{j}}\right) \prec \mathbf{m}$. Let $X=\left\{r:\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \prec \mathbf{m}\right\}$. Then

$$
\begin{equation*}
\mathbf{m}=\sum_{\mathcal{C}_{r} \text { in } D} \mu_{r}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)=\sum_{r \in X} \mu_{r}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)+\sum_{r \notin X} \mu_{r}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \tag{18}
\end{equation*}
$$

Now we show that $\mu_{r}>0$ for $r \in X$ and $\mu_{r}<0$ for $r \notin X$. Let $r \in X$. Then for $e_{t} \in E\left(\mathcal{C}_{r}\right)$, and from (18), we get that $[\mathbf{m}]_{t}=\mu_{r}\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{t}$. Since $\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \prec \mathbf{m}$, we get that $t \in \operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)_{+}\right)$or $t \in \operatorname{supp}\left(\mathbf{m}_{-}\right) \cap \operatorname{supp}\left(\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)_{-}\right)$for $e_{t} \in E\left(\mathcal{C}_{r}\right)$.

This implies that $\mu_{r}>0$ for $r \in X$ because of the equality $[\mathbf{m}]_{t}=\mu_{r}\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{t}$. In a similar way one can show that $\mu_{r}<0$ for $r \notin X$.

Let $\mu_{r}=\frac{p_{r}^{\prime}}{d_{r}^{\prime}}$ such that $\operatorname{gcd}\left(p_{r}^{\prime}, d_{r}^{\prime}\right)=1, p_{r}^{\prime} \in \mathbb{Z}, d_{r}^{\prime} \in \mathbb{N}$. Then $d_{r}^{\prime} \mid\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{j}$ for $e_{j} \in E\left(\mathcal{C}_{r}\right)$. Then by definition of $d_{r}, d_{r}^{\prime} \mid d_{r}$ and this implies that $\mu_{r}=\frac{p_{r}^{\prime}}{d_{r}^{\prime}}=\frac{p_{r}^{\prime \prime}}{d_{r}}, p_{r}^{\prime \prime} \in \mathbb{Z}$. For $r \in X$, $p_{r}^{\prime \prime}>0$ and let $p_{r}^{\prime \prime}=k_{r} d_{r}+p_{r}$, with $0 \leq p_{r}<d_{r}, p_{r} \in \mathbb{N}, k_{r} \in \mathbb{N} \cup\{0\}$. For $r \notin X, p_{r}^{\prime \prime}<0$ and let $p_{r}^{\prime \prime}=-k_{r} d_{r}+p_{r}$, with $0 \leq p_{r}<d_{r}, p_{r} \in \mathbb{N}, k_{r} \in \mathbb{N}$. Thus $\mathbf{m}$ is of the required form.

Corollary 4.9. Let $D$ be a weighted oriented graph consists of certain number of naturally oriented odd cycles( or unbalanced even cycles) and certain number of balanced cycles share a vertex such that $\prod_{v \in V(\mathcal{C})} w(v)$ has same value for each unbalanced cycle $\mathcal{C}$ in $D$. Then $\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.

Proof. Let $f \in G r_{D} \backslash \mathcal{C}_{D}$. Then using Lemma 3.10, $\operatorname{supp}\left(f_{\mathbf{m}}\right) \subseteq \cup_{\mathcal{C}} E(\mathcal{C})$, where union is taken over all unbalanced cycles $\mathcal{C}$ in $D$ and $\operatorname{supp}\left(f_{\mathbf{m}}\right)$ contains edges of at least three unbalanced cycles. Assume that $\operatorname{supp}\left(f_{\mathbf{m}}\right)=E\left(D_{1}\right)$ where $D_{1}$ consists of precisely $n$ unbalanced cycles. Then using Theorem 4.8 and Lemma $3.26, \mathbf{m}$ is of the form :

$$
\sum_{r \in X} k_{r}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)+\sum_{r \notin X}-k_{r}\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right)
$$

where $X=\left\{r:\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \prec \mathbf{m}\right\}, k_{r} \in \mathbb{N}, \mathcal{C}_{1}, \mathcal{C}_{2}, \ldots, \mathcal{C}_{n}$ are cycles of $D_{1}$. Note that $X \neq \emptyset$. Let $r \in X$. Then $\left(\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right) \prec \mathbf{m}$. Then Using Theorems 3.13 or 3.16 and arguments of proof of Lemma 3.26, we get $\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}\right]_{j}=\left[\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{1}}\right]_{j}$ for $e_{j} \in E\left(\mathcal{C}_{k}\right)$. Then $f_{\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}}^{+} \mid f_{\mathbf{m}}^{+}$and $f_{\mathbf{c}_{\mathbf{k}} \cup \mathbf{c}_{\mathbf{r}}}^{-} \mid f_{\mathbf{m}}^{-}$which is a contradiction as $f_{\mathbf{m}}$ is primitive. Thus $G r_{D}=\mathcal{C}_{D}$. As $I_{D}$ is strongly robust, $\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.

Remark 4.10. In the Corollary 4.9. $I_{D}$ is independent of the weight of that sharing vertex, that is, if we change weight of this vertex, generators remains same. Thus it is possible that there exists a weighted oriented graph $D$ such that the generators of $I_{D}$ are independent of the weight of a non-source non-sink vertex.

Corollary 4.11. Let $D$ be a weighted oriented graph consists of certain number of balanced cycles and certain number of unbalanced cycles share a vertex such that each unbalanced cycle has only one non-source non-sink vertex such that all these non-source non-sink vertices have equal weights and the sharing vertex is one of the below type:
(i) sink of each unbalanced cycle.
(ii) not a sink of any unbalanced cycle.
(iii) weight of this vertex is 1 .

Then $\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.
Proof. If $\mathcal{C}_{1}, \mathcal{C}_{2}, \mathcal{C}_{3}$ are cycles in $D$, then according to given condition, $\left[\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{2}}\right]_{i}=\left[\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{3}}\right]_{i}$ for $e_{i} \in E\left(\mathcal{C}_{1}\right)$ using Theorems 3.13 or 3.16 and arguments of proof of Lemma 3.28. Using Theorem 4.8, Lemma 3.28, Corollary 3.29, the proof of arguments is same as in Corollary 4.9 .

Remark 4.12. Let $D$ be weighted oriented graph as in Corollary 4.11. If $f$ is a part of minimal generators of $I_{D}$, then exponent of each variable in $f$ is 1 or $w$, where $w$ is the weight of any non-source non-sink vertex. For explicitly providing form of $f$, take $f_{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{2}}}$ be a part of minimal generators of $I_{D}$ corresponding to cycles $\mathcal{C}_{1}, \mathcal{C}_{2}$ in $D$ and $V\left(\mathcal{C}_{1}\right)=\left\{v_{1}, v_{2}, \ldots, v_{m_{1}}\right\}, e_{i}$ be the edge incident with $v_{i}$ and $v_{i+1}$ for $i=1,2, \ldots, m_{1}$ under convention $v_{m_{1}+1}=v_{1}$, $v_{1}$ is sharing vertex. If $v_{j}$ is non-source non-sink vertex, $v_{j} \neq v_{1}$, then exponent of $e_{i}$ is 1 for $1 \leq i<j$ and exponent of $e_{i}$ is $w$ for $j \leq i \leq m_{1}$ and if the sharing vertex is non-source non-sink vertex of both $\mathcal{C}_{1}$ and $\mathcal{C}_{2}$, then exponent of each variable in $f_{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{2}}}$ is 1 . Also $I_{D}$ is independent of weight of sink vertices.

Corollary 4.13. Let $D$ be weighted oriented graph consists of cycles share a vertex such that $V^{+}$are sinks. Then $\mathcal{M}_{D}=\mathcal{U}_{D}=G r_{D}=\mathcal{C}_{D}$.

Proof. Using Lemma 3.10, Theorem 4.8, Lemma 3.24 and using proof of arguments of Corollary 4.9, it follows.

Proposition 4.14. Let $D$ be weighted oriented graph consists of cycles share a vertex such that $V^{+}$are sinks. Let $G$ be the underlying simple graph of $D$. Then $I_{D}=I_{G}$.

Proof. As $V^{+}$are sinks, so every even cycle is balanced. Thus every unbalanced cycle is odd. Let $f_{\mathrm{m}} \in I_{D}$ be a primitive binomial such that $f_{\mathrm{m}} \neq f_{\mathrm{c}}$ for any even cycle $\mathcal{C}$ in $D$. Then using Lemma 3.10, $\operatorname{supp}\left(f_{\mathbf{m}}\right) \subseteq \cup_{\mathcal{C}} E(\mathcal{C})$, where union is taken over all unbalanced cycles $\mathcal{C}$ in $D$. We will show that $f_{\mathbf{m}} \in\left(f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}: \mathcal{C}_{i}, \mathcal{C}_{j}\right.$ are unbalanced in $\left.D\right)$. Suppose the number of unbalanced cycles in $D$ is $n$. We will prove the proposition by induction on $n$.
 $\mathcal{C}_{2}$, then $I_{D}=\left(f_{\mathbf{c}_{1} \cup \mathbf{c}_{2}}\right)$ by the Theorem 3.13. If $n=3$, the result is true by using Corollary
3.25 ,

Induction hypothesis : Suppose the result is true for any above type graph which consists of precisely $n_{1}$ unbalanced cycles, $n_{1}<n$.
Inductive step: Let $f_{\mathbf{m}} \in I_{D}$ be primitive binomial such that $\operatorname{supp}\left(f_{\mathbf{m}}\right) \subset\{E(\mathcal{C})$ : $\mathcal{C}$ is unbalanced in $D\}$. Then there is an subgraph $D_{1}$ of $D$ such that $\operatorname{supp}\left(f_{\mathbf{m}}\right)=E\left(D_{1}\right)$, $D_{1}$ consists of precisely $t$ unbalanced cycles sharing a vertex. If $t<n$, then we are done by induction hypothesis. Assume that $t=n$. Since $\operatorname{dim}_{\mathbb{Q}} \operatorname{Null}\left(A\left(D_{1}\right)\right)=n-1$ (by the Lemma (3.4), there exists a cycle $\mathcal{C}_{1}$ such that $\mathbf{m}$ is $\mathbb{Q}$-linear combination of $n-1$ elements from the set $\left\{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{i}}: \mathcal{C}_{i}\right.$ is cycle in $\left.D_{1}\right\}$. As $\left\{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{2}}, \mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\boldsymbol{3}}, \ldots, \mathbf{c}_{\boldsymbol{1}} \cup \mathbf{c}_{\mathbf{n}}\right\}$ is a linearly independent set, therefore this set is a basis of $\operatorname{Null}\left(A\left(D_{1}\right)\right)$. Let $\mathbf{m}=\sum_{i=2}^{n} \lambda_{i-1}\left(\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{i}}\right)$, for some $\lambda_{1}, \lambda_{2}, \ldots, \lambda_{n-1} \in \mathbb{Q}$. Without loss of generality we can assume that $\left.\left(\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{i}}\right)\right|_{E\left(\mathcal{C}_{1}\right)} \prec \mathbf{m}$ for $i=2,3, \ldots, n$. Assume that $\left.\left(\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{i}}\right)\right|_{E\left(\mathcal{C}_{i}\right)} \nprec \mathbf{m}$ for $i=2,3, \ldots, n$. Then $\lambda_{i}<0$ for $i=1,2, \ldots, n-1$. This implies that $j \in \operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\mathbf{m}_{-}\right)$for $e_{j} \in E\left(\mathcal{C}_{1}\right)$ which is a contradiction as $\operatorname{supp}\left(\mathbf{m}_{+}\right) \cap \operatorname{supp}\left(\mathbf{m}_{-}\right)=\emptyset$. Thus there exists a cycle $\mathcal{C}_{j}$ (say) such that $\left(\mathbf{c}_{\boldsymbol{1}} \cup \mathbf{c}_{\mathbf{j}}\right) \prec \mathbf{m}$.

Since $V^{+}$are sinks, $\left|[\mathbf{m}]_{i}\right|=\left|[\mathbf{m}]_{j}\right|$ for all $e_{i}, e_{j} \in E\left(\mathcal{C}_{1}\right)$ and similarly true for $\mathcal{C}_{j}$. Then using the Lemma 3.24, we can write $f_{\mathbf{m}}=h_{1} f_{\mathbf{c}_{\mathbf{1}} \cup \mathbf{c}_{\mathbf{j}}}+h_{2} f$, for some polynomials $h_{1}, h_{2}$ and $f \in I_{D^{\prime}}, E\left(D^{\prime}\right)=E\left(D_{1}\right) \backslash E\left(\mathcal{C}_{1}\right)$ or $E\left(D^{\prime}\right)=E\left(D_{1}\right) \backslash E\left(\mathcal{C}_{j}\right)$. Then by induction hypothesis, $f \in\left(f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}: \mathcal{C}_{i}, \mathcal{C}_{j}\right.$ are cycles in $\left.D_{1}\right)$. Thus $\left\{f_{\mathbf{c}}, f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}: \mathcal{C}\right.$ is even cycle, $\mathcal{C}_{i}$ and $\mathcal{C}_{j}$ are odd cycles in $D\}$ generates $I_{D}$ where exponent of each variable in $f_{\mathbf{c}}$ and $f_{\mathbf{c}_{\mathbf{i}} \cup \mathbf{c}_{\mathbf{j}}}$ is 1 i.e. $I_{D}=$ $I_{G}$.
