# $L^{p}$ estimate of the heat equation on a bounded domain 

Yoshinori Furuto*, Tsukasa Iwabuchi** and Ryusei Kohama<br>Mathematical Institute, Tohoku University<br>Sendai 980-8578 Japan

#### Abstract

We consider the linear heat equation on a bounded domain. We study estimates of the derivatives, up to the second order, of the solution locally in time in the Lebesgue spaces. We give a self-contained proof of the estimates in the end-point cases $p=1, \infty$.

## 1. Introduction

Let $d \geq 2$. Suppose that $\Omega$ be a bounded domain of $\mathbb{R}^{d}$. We consider the heat equation with the Dirichlet boundary condition.

$$
\left\{\begin{align*}
\partial_{t} u-\Delta u & =0 & & \text { in }(0, T) \times \Omega,  \tag{1.1}\\
u & =0 & & \text { on }(0, T) \times \partial \Omega, \\
u(0, \cdot) & =u_{0}(\cdot) & & \text { in } \Omega .
\end{align*}\right.
$$

Our aim is to obtain $L^{p}$ estimates of second-order derivatives.
Let us recall some classical results. If $\Omega$ is a sufficiently smooth bounded domain and $p \in(1, \infty)$, then there exists the heat semigroup $\left\{S_{p}(t)\right\}_{t \geq 0}$ on $L^{p}(\Omega)$ and the solution $u(t):=S_{p}(t) u_{0}$, defined by the semigroup, satisfies the following $L^{p}-L^{p}$ estimates.

$$
\begin{align*}
\|u(t)\|_{L^{p}} & \leq C\left\|u_{0}\right\|_{L^{p}}  \tag{1.2a}\\
\|\nabla u(t)\|_{L^{p}} & \leq C t^{-1 / 2}\left\|u_{0}\right\|_{L^{p}}, \quad \text { for } t>0  \tag{1.2b}\\
\left\|\nabla^{2} u(t)\right\|_{L^{p}} & \leq C t^{-1}\left\|u_{0}\right\|_{L^{p}}, \tag{1.2c}
\end{align*}
$$

where $\|\cdot\|_{L^{p}}$ is the norm of $L^{p}(\Omega)$. We notice that $u(t)$ decays exponentially in $L^{p}(\Omega)$ for large $t$. Our aim is to consider it locally in time.

In what follows, we suppose $u_{0} \in C_{c}^{\infty}(\Omega)$, which implies $S_{2}(t) u_{0}=S_{p}(t) u_{0}$ for any $p \in$ $(1, \infty)$. We then abbreviate $p$, and often use the following notation

$$
S(t) u_{0}=S_{p}(t) u_{0} .
$$

[^0]Theorem 1.1. Let $d \geq 2$. Suppose that $\Omega$ be a bounded domain of $\mathbb{R}^{d}$ with $C^{3}$ boundary, $u_{0} \in C_{c}^{\infty}(\Omega)$, and $1 \leq p \leq \infty$. Then $u(t):=S(t) u_{0}$ satisfies that

$$
\begin{align*}
\|u(t)\|_{L^{p}} & \leq C\left\|u_{0}\right\|_{L^{p}}, \\
\|\nabla u(t)\|_{L^{p}} & \leq C t^{-1 / 2}\left\|u_{0}\right\|_{L^{p}}  \tag{1.3}\\
\left\|\nabla^{2} u(t)\right\|_{L^{p}} & \leq C t^{-1}\left\|u_{0}\right\|_{L^{p}}
\end{align*}
$$

for all $t>0$.
Remark. The smoothness of the boundary of $\Omega$ is needed for the $L^{\infty}$ estimate, where we follow the argument of the paper by Abe-Giga [1]. We do not impose any assumption for the $L^{1}$ estimate. We will prove it by modifying the argument in [3].

We refer to some existing literature on derivative estimates. In the case when $\Omega$ is a smooth bounded domain, the estimate of the solution itself is obvious from the property of the semigroup. For the first derivatives, (1.2b) holds for $p \in[1, \infty]$ (see [2], [6] and [1]). For the second derivatives, if $p \in(1, \infty)$, then (1.2c) can be obtained by using $L^{p}$ elliptic estimate and basic property of analytic semigroup (see [10] and [7]). In addition, (1.2c) holds for $p=\infty$ (see [1]).

We give a few comments on our proof. We prove only the case $p=1, \infty$. The boundedness of without derivatives is due to the basic property of the $C_{0}$ semigroup. For $p=1$, we argue similarly to the paper [3] who considered the first derivative. As for $p=\infty$, we apply the contradiction argument by [1] for the Stokes equations. Although not used in this paper, there is a possibility to show this theorem by direct estimate of the heat kernel using the method in [5].

This paper is organized as follows. In Section 2, we prepare a lemma and a proposition to prove the theorem for $p=\infty$. In Sections 3 and 4, we prove the theorem for $p=1, \infty$. In the Appendix, we show some lemmas for the paper to be self-contained.

Notation. We denote by $A$ the Dirichlet Laplacian, which is defined by

$$
\left\{\begin{array}{l}
D(A)=\left\{f \in H_{0}^{1}(\Omega) \mid \Delta f \in L^{2}(\Omega)\right\} \\
A f=-\sum_{j=1}^{d} \partial_{x_{j}}^{2} f, \quad f \in D(A)
\end{array}\right.
$$

We notice that $A$ is a self-adjoint operator on $L^{2}(\Omega)$ and by the argument in the paper [2], $e^{-t A}$ can be defined in more generalized distribution spaces based on the spectral multiplier. If $u_{0} \in C_{c}^{\infty}(\Omega)$, then $S(t) u_{0}=e^{-t A} u_{0}$, which is used in the proof for $p=1$.

## 2. Preliminaries

We prepare a lemma and a proposition for the proof when $p=\infty$. We consider the estimate for the following quantity.

$$
N[u](t, x):=|u(t, x)|+t^{1 / 2}|\nabla u(t, x)|+t\left|\nabla^{2} u(t, x)\right|+t\left|\partial_{t} u(t, x)\right| .
$$

The first lemma considers an estimate of $N[u]$, and that for the Stokes equations is known (see [1]).
Lemma 2.1. Suppose that $\Omega$ is a bounded domain with $C^{3}$ boundary. Let $d<r<\infty$. Assume that $u_{0} \in D\left(A_{r}\right)$, where $-A_{r}$ is the generator of the heat semigroup in $L^{r}(\Omega)$, and define $u(t):=S_{r}(t) u_{0}$. Then, $u(t, \cdot) \in C^{2}(\Omega)$ for all $t>0$ and

$$
\sup _{0<t<1}\|N[u](t)\|_{L^{\infty}}<\infty
$$

Proof. We will show that there exists $C=C(\Omega, r)>0$ such that

$$
\begin{array}{r}
\sup _{0<t<1}\left(\|u(t)\|_{W^{1, r}}+t^{1 / 2}\|\nabla u(t)\|_{W^{1, r}}+t\left\|\nabla^{2} u(t)\right\|_{W^{1, r}}+t\left\|\partial_{t} u(t)\right\|_{W^{1, r}}\right)  \tag{2.4}\\
\leq C\left\|u_{0}\right\|_{D\left(A_{r}\right)},
\end{array}
$$

where $\left\|u_{0}\right\|_{D\left(A_{r}\right)}:=\left\|u_{0}\right\|_{L^{r}}+\left\|A_{r} u_{0}\right\|_{L^{r}}$.
By the property of the analytic semigroup $S_{r}(t)=e^{-t A_{r}}$, we have

$$
\sup _{0<t<1}\|u(t)\|_{D\left(A_{r}\right)}+\sup _{0<t<1} t\left\|\partial_{t} u(t)\right\|_{D\left(A_{r}\right)} \leq C\left\|u_{0}\right\|_{D\left(A_{r}\right)}
$$

where $C=C(\Omega, r)$. Thus we have proved

$$
\sup _{0<t<1}\left(\|u(t)\|_{W^{1, r}}+\|\nabla u(t)\|_{W^{1, r}}+t\left\|\partial_{t} u(t)\right\|_{W^{2, r}}\right) \leq C\left\|u_{0}\right\|_{D\left(A_{r}\right)}
$$

as the $D\left(A_{r}\right)$ norm and the $W^{2, r}(\Omega)$ norm are equivalent by the elliptic estimate. The terms

$$
\|u(t)\|_{W^{1, r}}, \quad t^{1 / 2}\|\nabla u(t)\|_{W^{1, r}}, \quad t\left\|\nabla^{2} u(t)\right\|_{L^{r}}, \quad t\left\|\partial_{t} u(t)\right\|_{W^{1, r}}
$$

are less than or equal to the left hand side above.
It remains to prove that

$$
\sup _{0<t<1} t\left\|\nabla^{3} u(t)\right\|_{L^{r}} \leq C\left\|u_{0}\right\|_{D\left(A_{r}\right)}
$$

Applying the estimate in a nonhomogeneous elliptic equation (Theorem A. 1 for $k=1$ and $f=\partial_{t} u$ ), we can obtain

$$
\begin{aligned}
\left\|\nabla^{3} u(t)\right\|_{L^{r}} & \leq C\left(\|u(t)\|_{L^{r}}+\left\|\partial_{t} u(t)\right\|_{W^{1, r}}\right) \\
& \leq C\left\|u_{0}\right\|_{D\left(A_{r}\right)}, \quad t>0
\end{aligned}
$$

which proves the above inequality. Here the assumption that $\Omega$ is a $C^{3}$ domain is needed for Theorem A. 1 .

Proposition 2.2. Let $\Omega=\mathbb{R}_{+}^{d}$. Suppose that $u$ satisfies

$$
\int_{0}^{T} \int_{\Omega} u\left(\partial_{t} \phi+\Delta \phi\right) d x d t=0
$$

for any $\phi \in C\left([0, T] ; W_{0}^{1,1}(\Omega) \cap W^{2,1}(\Omega) \cap C(\Omega)\right) \cap C^{1}\left([0, T] ; L^{1}(\Omega)\right)$ with $|\nabla \phi(x)| \leq C(1+$ $\left.|x|^{2}\right)^{-d / 2}$. Then $u$ is 0 almost everywhere.

## 3. $L^{1}$ Estimate

We follow the argument as in the paper [3]. Instead of $S(t) u_{0}$, we consider more general problem, which is the boundedness of the spectral multiplier $\varphi(t A)$, where $\varphi: \mathbb{R} \rightarrow \mathbb{R}$ with $\operatorname{supp} \varphi \subset[0, \infty)$.

Following the proof of Theorem 2.1 in [3], we decompose $\Omega$ by using cubes whose side length is $t^{\frac{1}{2}}$, and apply the Hölder inequality to have that

$$
\begin{equation*}
\left\|\nabla^{2} \varphi(t A) f\right\|_{L^{1}} \leq t^{\frac{d}{4}}\left\|\nabla^{2} \varphi(t A) f\right\|_{\ell^{1}\left(L^{2}\right) t} \tag{3.5}
\end{equation*}
$$

where

$$
\left\|\nabla^{2} \varphi(t A) f\right\|_{\ell^{1}\left(L^{2}\right) t}:=\sum_{n \in \mathbb{Z}^{d}}\left\|\nabla^{2} \varphi(t A) f\right\|_{L^{2}\left(C_{t}(n)\right)},
$$

$C_{t}(n)$ is a cube with side $t^{1 / 2}$ centered $t^{1 / 2} n \in \mathbb{R}^{d}$. Introduce $\widetilde{\varphi} \in \mathcal{S}(\mathbb{R})$ such that

$$
\widetilde{\varphi}(\lambda)=(1+\lambda)^{\beta} \varphi(\lambda), \quad \beta>0
$$

We can write

$$
\begin{aligned}
& \left\|\nabla^{2} \varphi(t A) f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} \\
= & \left\|\nabla^{2} \widetilde{\varphi}(t A)(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} \\
\leq & C\left(\left\|\nabla^{2} \widetilde{\varphi}(t A)\right\|_{L^{2} \rightarrow L^{2}}+t^{-\frac{d}{4}}\| \| \nabla^{2} \widetilde{\varphi}(t A)\| \|_{\alpha}^{\frac{d}{2 \alpha}}\left\|\nabla^{2} \widetilde{\varphi}(t A)\right\|_{L^{2} \rightarrow L^{2}}^{1-\frac{d}{2 \alpha}}\right)\left\|(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}}
\end{aligned}
$$

for any $\alpha>d / 2$, where

$$
\left\|\left|\nabla^{2} \widetilde{\varphi}(t A)\right|\right\|_{\alpha}:=\sup _{n \in \mathbb{Z}^{d}}\left\|\left|\cdot-t^{1 / 2} n\right|^{\alpha} \nabla^{2} \widetilde{\varphi}(t A) \chi_{C_{t}(n)}\right\|_{L^{2} \rightarrow L^{2}} .
$$

The elliptic estimate in $L^{2}(\Omega)$ shows that

$$
\left\|\nabla^{2} \widetilde{\varphi}(t A)\right\|_{L^{2} \rightarrow L^{2}} \leq C\|A \widetilde{\varphi}(t A)\|_{L^{2} \rightarrow L^{2}} \leq C t^{-1}
$$

As for $\left\|\left\|\nabla^{2} \widetilde{\varphi}(t A) \mid\right\|_{\alpha}\right.$, by following the proof of Lemma 7.1 in [3], $\nabla^{2} \widetilde{\varphi}(t A)$ can be written with the following

$$
\begin{gathered}
\nabla^{2}(1+t A)^{-1}, \quad \nabla(1+t A)^{-1}, \quad(1+t A)^{-1}, \quad e^{i s(1+t A)^{-1}}, \\
\text { integrals of Fourier transform of } \widetilde{\varphi}, \\
4
\end{gathered}
$$

and we conclude that

$$
\left\|\left\|\nabla^{2} \widetilde{\varphi}(t A)\right\|\right\|_{\alpha} \leq C t^{\frac{\alpha-2}{2}}
$$

The above two inequlities show that

$$
\begin{align*}
\left\|\nabla^{2} \varphi(t A) f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} & \leq C\left(t^{-1}+t^{-\frac{d}{4}}\left(t^{\frac{\alpha-2}{2}}\right)^{\frac{d}{2 \alpha}}\left(t^{-1}\right)^{1-\frac{d}{2 \alpha}}\right)\left\|(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}}  \tag{3.6}\\
& =C t^{-1}\left\|(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}}
\end{align*}
$$

Finally, it follows by Proposition 7.1 in [3] that

$$
\left\|(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} \leq C t^{-\frac{d}{4}}\|f\|_{L^{1}}
$$

We then obtain by (3.5) that

$$
t^{\frac{d}{4}}\left\|\nabla^{2} \varphi(t A) f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} \leq C t^{\frac{d}{4}} t^{-1}\left\|(1+t A)^{-\beta} f\right\|_{\ell^{1}\left(L^{2}\right)_{t}} \leq C t^{-1}\|f\|_{L^{1}}
$$

## 4. $L^{\infty}$ ESTIMATE

Theorem 4.1. Let $\Omega \subset \mathbb{R}^{d}$ be a bounded domain with $C^{3}$ boundary. Then, there exists $C>0$ and $T>0$ such that

$$
\sup _{0<t<T}\|N[u](t)\|_{L^{\infty}}<C\left\|u_{0}\right\|_{L^{\infty}}
$$

holds for any solution $u(t)$ of (1.1) with $u_{0} \in C_{c}^{\infty}(\Omega)$.
Proof. Prove by contradiction. Assume that there exist a sequence $\left\{u_{m}\right\}_{m \in \mathbb{N}}$ of solution to (1.1) and a sequence $\left\{\tau_{m}\right\}_{m \in \mathbb{N}}$ such that

$$
\begin{aligned}
\left\|N[u]\left(\tau_{m}\right)\right\|_{L^{\infty}} & >m\left\|u_{0, m}\right\|_{L^{\infty}}, \\
\tau_{m} & \searrow 0(m \rightarrow \infty)
\end{aligned}
$$

where $u_{0, m} \in C_{c}^{\infty}(\Omega)$ is an initial data of $u_{m}$.
Now we introduce a function $v_{m}$ as follows. It holds that $M_{m}:=\sup _{t \in\left(0, \tau_{m}\right)}\left\|N\left[u_{m}\right](t)\right\|_{L^{\infty}}<\infty$ by Lemma 2.1, and we define $\tilde{u}_{m}:=u_{m} / M_{m}$. Then, there exists some point $\left(t_{m}, x_{m}\right) \in$ $\left(0, \tau_{m}\right) \times \Omega$ satisfying $N\left[\tilde{u}_{m}\right]\left(t_{m}, x_{m}\right) \geq 1 / 2$. We therefore define $v_{m}$ by translating and scaling where the point $\left(t_{m}, x_{m}\right)$ corresponds to the point $(1,0)$.

$$
\begin{aligned}
v_{m}(t, x):= & \tilde{u}_{m}\left(t_{m} t, x_{m}+t_{m}^{1 / 2} x\right) \quad \text { for }(t, x) \in(0,1) \times \Omega_{m} \\
& \text { where } \Omega_{m}:=\left\{y \in \mathbb{R}^{d} \left\lvert\, y=\frac{x-x_{m}}{t_{m}^{1 / 2}}\right., x \in \Omega\right\} .
\end{aligned}
$$

Here $v_{m}$ satisfies the heat equation and the following inequities.

$$
\begin{array}{r}
\mathrm{N}\left[v_{m}\right](1,0)=\mathrm{N}\left[\tilde{u}_{m}\right]\left(t_{m}, x_{m}\right) \geq \frac{1}{2}, \\
\sup _{t \in(0,1)}\left\|\mathrm{N}\left[v_{m}\right](t)\right\|_{L^{\infty}}=\sup _{t \in\left(0, t_{m}\right)}\left\|\mathrm{N}\left[\tilde{u}_{m}\right](t)\right\|_{L^{\infty}} \leq 1, \\
\left\|v_{0, m}\right\|_{L^{\infty}}=\left\|\tilde{u}_{0, m}\right\|_{L^{\infty}}<\frac{1}{m} .
\end{array}
$$

The situation depends on whether the limit of

$$
c_{m}:=\frac{d\left(\Omega, x_{m}\right)}{t_{m}^{1 / 2}}=d\left(\Omega_{m}, 0\right)
$$

goes infinity or not.
Case 1. $\limsup _{m \rightarrow \infty} c_{m}=\infty$
Take the subsequence so that $\lim _{m \rightarrow \infty} c_{m}=\infty$. We denote $\tilde{v}_{m}$ as an extension of $v_{m}$ to $\mathbb{R}^{d}$.
By a compact embedding $W^{3, r}(\Omega) \subset \subset W^{2, \infty}(\Omega)$, there exist a subsequence $\left\{\tilde{v}_{m(k)}\right\}_{k \in \mathbb{N}}$ and $\tilde{v}$ such that $\tilde{v}_{m(k)}$ converges to $\tilde{v}$ locally uniformly in $\mathbb{R}^{d} \times(0,1]$.

For any $\phi \in C_{c}^{\infty}\left(\mathbb{R}^{d} \times[0,1)\right)$, it follows

$$
\int_{0}^{1} \int_{\mathbb{R}^{d}} \tilde{v}_{m(k)} \cdot\left(\partial_{t} \phi+\Delta \phi\right) d x d t=\int_{\mathbb{R}^{d}} \tilde{v}_{m(k)}(x, 0) \cdot \phi(x, 0) d x,
$$

and by taking the limit as $k \rightarrow \infty$, we obtain

$$
\int_{0}^{1} \int_{\mathbb{R}^{d}} \tilde{v} \cdot\left(\partial_{t} \phi+\Delta \phi\right) d x d t=0
$$

Therefore the limit $\tilde{v}$ is the weak solution of heat equation and it follows $\tilde{v} \equiv 0$ by the uniqueness of the heat equation (see section 4.4.2 in [9]). However, it contradicts $N[\tilde{v}](1,0) \geq$ $1 / 2$.

Case 2. $\lim \sup c_{m}<\infty$
By taking a subsequence, we assume that $\lim _{m \rightarrow \infty} c_{m}=c_{0}<\infty$ and $x_{m}$ converges to $\hat{x} \in \partial \Omega$. In addition, by rotation and translation, we also assume $\hat{x}=0$.

Since $\Omega$ is of $C^{3}$, there exisits a $C^{3}$ function $h$ such that

$$
\begin{aligned}
&\left(\Omega_{m}\right)_{\mathrm{loc}}:=\left\{\left(y^{\prime}, y_{d}\right) \in \mathbb{R}^{d}\right. \mid h\left(x_{m}^{\prime}+t_{m}^{1 / 2} y^{\prime}\right)<\left(x_{m}\right)_{d}+t_{m}^{1 / 2} y_{d} \\
&\left.\quad<h\left(x_{m}^{\prime}+t_{m}^{1 / 2} y^{\prime}\right)+\beta,\left|t_{m}^{1 / 2} y^{\prime}\right|<\alpha\right\} \subset \Omega_{m} \\
& \nabla h(0)=0, h(0)=0 .
\end{aligned}
$$

where $\alpha, \beta$ are the constants independent of $\hat{x} \in \partial \Omega$.

Since $d\left(\Omega_{m}, x_{m}\right) /\left(x_{m}\right)_{d} \rightarrow 1$ as $m \rightarrow \infty$, the domain $\left(\Omega_{m}\right)_{\text {loc }}$ approaches to

$$
\mathbb{R}_{+,-c_{0}}^{d}:=\left\{\left(x^{\prime}, x_{d}\right) \in \mathbb{R}^{d} \mid x_{d}>-c_{0}\right\} .
$$

Fix $R>0$ and let $B_{R}^{+}=B_{R}\left(0, \ldots, 0,-c_{0}\right) \cap \mathbb{R}_{+,-c_{0}}^{d}$.
Define $\tilde{v}_{m} \in W^{3, r}\left(\mathbb{R}^{d} \times(0,1]\right)$ as an extension of $v_{m}$ and there exists $\tilde{v} \in W^{2, \infty}\left(\mathbb{R}_{+,-c_{0}}^{d} \times\right.$ $(0,1])$ and $C>0$ such that

$$
\begin{gathered}
\tilde{v}_{m(k)} \rightarrow \tilde{v} \\
\nabla \tilde{v}_{m(k)} \rightarrow \nabla \tilde{v} \quad \text { locally uniformly in } \overline{\mathbb{R}}_{+,-c_{0}}^{d} \times(0,1], \\
\nabla^{2} \tilde{v}_{m(k)} \rightarrow \nabla^{2} \tilde{v} \\
\left\|\tilde{v}_{m}\right\|_{W^{2, \infty}\left(\mathbb{R}_{+,-c_{0}}^{d} \times(0,1)\right)} \leq C\left\|v_{m}\right\|_{W^{2, \infty}\left(B_{R}^{+} \times(0,1)\right)} \text { for all } m \in \mathbb{N}
\end{gathered}
$$

where $\tilde{v}_{m(k)}$ is a subsequence of $\left\{\tilde{v}_{m}\right\}_{m \in \mathbb{N}}$. For simplicity, we denote the subsequence by $\left\{\tilde{v}_{m}\right\}_{m \in \mathbb{N}}$.

Fix a test funciton

$$
\phi \in C\left([0,1] ; W_{0}^{1,1}\left(R_{+,-c_{0}}^{d}\right) \cap W^{2,1}\left(R_{+,-c_{0}}^{d}\right) \cap C\left(R_{+,-c_{0}}^{d}\right)\right) \cap C^{1}\left([0,1] ; L^{1}\left(R_{+,-c_{0}}^{d}\right)\right)
$$

with $|\nabla \phi(x)| \leq C\left(1+|x|^{2}\right)^{-d / 2}$.
Since $v_{m}$ satisfies (1.1) in $\Omega_{m} \times(0,1]$, it follows

$$
\begin{aligned}
0 & =\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} \Delta \tilde{v}_{m} \phi d x d t-\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}}\left(\partial_{t} \tilde{v}_{m}\right) \phi d x d t \\
& =-\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} \nabla \tilde{v}_{m} \cdot \nabla \phi d x d t+\int_{0}^{1} \int_{\partial\left(\Omega_{m} \cap B_{R}^{+}\right)}\left(\nabla \tilde{v}_{m} \cdot \boldsymbol{n}\right) \phi d x d t \\
& \left.-\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} * \partial_{t} \tilde{v}_{m}\right) \phi d x d t .
\end{aligned}
$$

For the second term, divide the integral domain into $\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \cap \partial B_{R}^{+}$and $\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \backslash \partial B_{R}^{+}$. Then, by the decay of $|\phi|$, the continuity of $\phi$ and $\phi \in W_{0}^{1,1}$, it holds

$$
\begin{aligned}
\sup _{m \in \mathbb{N}} & \left|\int_{0}^{1} \int_{\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \cap \partial B_{R}^{+}}\left(\nabla \tilde{v}_{m} \cdot \boldsymbol{n}\right) \phi d x d t\right| \rightarrow 0 \quad \text { as } R \rightarrow \infty, \\
& \left|\int_{0}^{1} \int_{\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \backslash \partial B_{R}^{+}}\left(\nabla \tilde{v}_{m} \cdot \boldsymbol{n}\right) \phi d x d t\right| \rightarrow 0 \quad \text { as } m \rightarrow \infty .
\end{aligned}
$$

From the Lebesgue's dominated convergence theorem and Fubini's theorem the integration respect with t , for any $\delta>0$, there exists $M \in \mathbb{N}$ such that for $m \geq M$,

$$
\begin{aligned}
& \left|\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} \nabla \tilde{v}_{m} \cdot \nabla \phi d x d t-\int_{0}^{1} \int_{B_{R}^{+}} \nabla \tilde{v}_{m} \cdot \nabla \phi d x d t\right|<\delta, \\
& \left|\int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}}\left(\partial_{t} \tilde{v}_{m}\right) \phi d x d t-\int_{0}^{1} \int_{B_{R}^{+}}\left(\partial_{t} \tilde{v}_{m}\right) \phi d x d t\right|<\delta .
\end{aligned}
$$

We consider the integral on $B_{R}^{+}$. By integration by parts,

$$
\begin{aligned}
& -\int_{0}^{1} \int_{B_{R}^{+}} \nabla \tilde{v}_{m} \cdot \nabla \phi d x d t \\
= & \int_{0}^{1} \int_{B_{R}^{+}} \tilde{v}_{m} \Delta \phi d x d t-\int_{0}^{1} \int_{\partial B_{R}^{+}} \tilde{v}_{m}(\nabla \phi \cdot \boldsymbol{n}) d x d t
\end{aligned}
$$

For the second term, we again divide the integral domain into $\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \cap \partial B_{R}^{+}$and $\partial\left(\Omega_{m} \cap B_{R}^{+}\right) \backslash \partial B_{R}^{+}$. Then the decay of $|\nabla \phi|$ implies

$$
\sup _{m \in \mathbb{N}}\left|\int_{0}^{1} \int_{\left\{x_{d} \neq-c_{0}\right\} \cap \partial B_{R}^{+}} \tilde{v}_{m}(\nabla \phi \cdot \boldsymbol{n}) d x d t\right| \rightarrow 0 \quad \text { as } R \rightarrow \infty .
$$

Now we estimate $\tilde{v}_{m}(t, x)$ at $x \in \partial B_{R}^{+}, x_{d}=-c_{0}$. Let $w_{m}:=\sup _{y \in \partial\left(\Omega_{m} \cap B_{R}^{+}\right) \backslash \partial B_{R}^{+}}\left|y_{d}\right|$ and notice that

$$
\begin{gathered}
w_{m} \rightarrow 0 \text { as } m \rightarrow \infty \\
\operatorname{dist}\left(x, \Omega_{m}\right)<w_{m} \text { for all } x \in \partial B_{R}^{+}, x_{d}=-c_{0}
\end{gathered}
$$

For any points $x \in \partial B_{R}^{+}, x_{d}=-c_{0}$, define $x_{b}$ as the point in $\partial \Omega_{m}$ that is closest to $x$, then

$$
\begin{aligned}
\left|\tilde{v}_{m}(t, x)\right| & =\left|\tilde{v}_{m}(t, x)-\tilde{v}_{m}\left(t, x_{b}\right)\right| \\
& \leq \int_{0}^{1}\left|\partial_{\theta} \tilde{v}_{m}\left(t, \theta x+(1-\theta) x_{b}\right)\right| d \theta \\
& \leq\left|x-x_{b}\right| \times \mid D \tilde{v}_{m}\left(t, \theta_{0} x+\left(1-\theta_{0}\right) x_{b} \mid \quad \text { for some } \theta_{0} \in(0,1)\right. \\
& \leq w_{m} \times C t^{-1 / 2}
\end{aligned}
$$

By this estimate and the limit $w_{m} \rightarrow 0$ as $m \rightarrow \infty$, we obtain

$$
\int_{0}^{1} \int_{\left\{x_{d}=-c_{0}\right\} \cap \partial B_{R}^{+}} \tilde{v}_{m}(\nabla \phi \cdot \boldsymbol{n}) d x d t \rightarrow 0 \quad \text { as } m \rightarrow \infty .
$$

From above, we take the limits $m \rightarrow \infty, R \rightarrow \infty$ in this order, then

$$
\lim _{R \rightarrow \infty} \lim _{m \rightarrow \infty} \int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} \Delta \tilde{v}_{m} \phi d x d t=\int_{0}^{1} \int_{\mathbb{R}_{+,-c_{0}}^{d}} \tilde{v} \Delta \phi d x d t .
$$

Similarly, it holds

$$
\lim _{R \rightarrow \infty} \lim _{m \rightarrow \infty} \int_{0}^{1} \int_{\Omega_{m} \cap B_{R}^{+}} \partial_{t} \tilde{v}_{m} \phi d x d t=-\int_{0}^{1} \int_{\mathbb{R}_{+,-c_{0}}^{d}} \tilde{v} \partial_{t} \phi d x d t-\int_{\mathbb{R}_{+,-c_{0}}^{d}} \tilde{v}(0, x) \phi(0, x) d x,
$$

and therefore, $\tilde{v}$ satisfies

$$
\int_{0}^{1} \int_{\mathbb{R}_{+,-c_{0}}^{d}} \tilde{v}\left(\Delta \phi+\partial_{t} \phi\right) d x d t=-\int_{\mathbb{R}_{+,-c_{0}}^{d}} \tilde{v}(0, x) \phi(0, x) d x .
$$

In other words, $\tilde{v}$ is a weak solution of the heat equation on $\mathbb{R}_{+,-c_{0}}^{d}$.
By the uniqueness of the heat equation for the half space (Proposition 2.2), it follows $\tilde{v} \equiv 0$. However, it contradicts $N[\tilde{v}](1,0) \geq 1 / 2$.

## Appendix A. higher-Order Derivative estimates

We show the following theorem for the paper to be self-contained. Proof idea can be found in the book by Gilbarg-Trudinger [7] (Theorem 9.19.) .

Theorem A.1. Suppose $k \in \mathbb{N} \cup\{0\}$. Let $\Omega \subset \mathbb{R}^{d}$ be a bounded domain with $C^{k+2}$ boundary and $p \in(1, \infty)$. If $u \in W^{2, p}(\Omega), f \in W^{k, p}(\Omega)$ satisfy

$$
\left\{\begin{align*}
\Delta u=f & \text { in } \Omega,  \tag{A.7}\\
u=0 & \text { on } \partial \Omega
\end{align*}\right.
$$

then $u \in W^{k+2, p}(\Omega)$ and there exists $C=C(n, k, p)$ such that

$$
\left\|D^{k+2} u\right\|_{L^{p}(\Omega)} \leq C\left(\|u\|_{L^{p}(\Omega)}+\|f\|_{W^{k, p}(\Omega)}\right)
$$

The proof is derived from an internal estimate and a boundary estimate.
Lemma A.2. Assume the same as in the Theorem A.1. Then, for any subdomain $\Omega^{\prime} \subset \subset \Omega$, $u \in W^{k+2, p}\left(\Omega^{\prime}\right)$ and satisfies

$$
\left\|D^{k+2} u\right\|_{L^{p}\left(\Omega^{\prime}\right)} \leq C\left(\|u\|_{L^{p}(\Omega)}+\|f\|_{W^{k, p}(\Omega)}\right)
$$

Proof. We refer to Theorem 9.11. in [7] in the case when $k=0$.
Let $k=l \geq 1$. For any $i=1, \ldots, d, u$ and $f$ satisfy

$$
\Delta\left(\partial_{i} u\right)=\partial_{i} f \quad \text { in } \Omega
$$

and

$$
\left\|D^{l+1}\left(\partial_{i} u\right)\right\|_{L^{p}\left(\Omega^{\prime}\right)} \leq C\left(\left\|\partial_{i} u\right\|_{L^{p}(\Omega)}+\left\|\partial_{i} f\right\|_{W^{l-1, p}(\Omega)}\right) .
$$

by the estimate for $k=l-1$.
The elliptic estimiate implies

$$
\left.\|D u\|_{L^{p}(\Omega)} \leq C \underset{9}{\left(\|u\|_{L^{p}(\Omega)}\right.}+\|f\|_{L^{p}(\Omega)}\right)
$$

and therefore,

$$
\begin{aligned}
\left\|D^{l+2} u\right\|_{L^{p}\left(\Omega^{\prime}\right)} & \leq C\left(\|D u\|_{L^{p}(\Omega)}+\|D f\|_{W^{l-1, p}(\Omega)}\right) \\
& \leq C\left(\|u\|_{L^{p}(\Omega)}+\|f\|_{W^{l, p}(\Omega)}\right)
\end{aligned}
$$

Lemma A.3. Let $\Omega^{+}:=\Omega \cap \mathbb{R}_{+}^{d},(\partial \Omega)^{+}:=\partial \Omega \cap \mathbb{R}_{+}^{d}$. If $u \in W_{0}^{1, p}\left(\Omega^{+}\right), f \in W^{k, p}\left(\Omega^{+}\right)$satisfy

$$
\left\{\begin{align*}
\Delta u=f & \text { in } \Omega^{+}  \tag{A.8}\\
u=0 & \text { on }(\partial \Omega)^{+}
\end{align*}\right.
$$

then $u \in W^{k+2, p}\left(\Omega^{+}\right)$and there exists $C=C(n, k, p)$ such that

$$
\left\|D^{k+2} u\right\|_{L^{p}\left(\Omega^{+}\right)} \leq C\left\|D^{k} f\right\|_{L^{p}\left(\Omega^{+}\right)}
$$

Proof. We follow the argument as Lemma 9.12 in [7].
Let $k \geq 1$. Extend $u$ and $f$ to $\mathbb{R}_{+}^{d}$ by zero-extension and then to $\mathbb{R}^{d}$ by odd reflection. Then $u \in W^{1, p}\left(\mathbb{R}^{d}\right)$ is a weak solution of $\Delta u=f$.

Since supp $u \subset \mathbb{R}^{d}$ is compact, the regularization $u_{h}:=u * \rho_{h} \in C_{c}^{\infty}\left(\mathbb{R}^{d}\right), f_{h}:=f * \rho_{h} \in$ $C_{c}^{\infty}\left(\mathbb{R}^{d}\right)$ where $\rho_{h}$ is a mollifier such that

$$
\begin{aligned}
& \operatorname{supp} \rho_{h} \subset\{|x|<h\}, \\
& \rho_{h} * g \rightarrow g \text { in } L^{p}\left(\mathbb{R}^{d}\right) \quad(h \rightarrow 0)
\end{aligned}
$$

for any $g \in L^{p}\left(\mathbb{R}^{d}\right)$.
Then, it holds that $\Delta \partial_{i} u_{h}=\partial_{i} f_{h}$ and

$$
\begin{aligned}
\left\|D^{k+2} u_{h}\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} & \leq C\left\|\nabla^{2} D^{k} u_{h}\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} \\
& \leq C\left\|\Delta D^{k} u_{h}\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} \\
& =C\left\|D^{k} f_{h}\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} .
\end{aligned}
$$

by Calderon-Zygmund inequality (see Theorem 9.4. in [7]). We take the limit as $h \rightarrow 0$, then

$$
\left\|D^{k+2} u\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} \leq C\left\|D^{k} f\right\|_{L^{p}\left(\mathbb{R}^{d}\right)}
$$

and

$$
\begin{aligned}
\left\|D^{k+2} u\right\|_{L^{p}(\Omega)} & \leq\left\|D^{k+2} u\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} \\
& \leq C\left\|D^{k} f\right\|_{L^{p}\left(\mathbb{R}^{d}\right)} \\
& \leq C\left\|D^{k} f\right\|_{L^{p}(\Omega)}
\end{aligned}
$$

from the definition of the extension.
Lemma A.4. Assume the same as in the Theorem A.1. Then, for any subdomain $\Omega^{\prime} \subset \subset$ $\Omega \cup \partial \Omega, u \in W^{k+2, p}\left(\Omega^{\prime}\right)$ and satisfies

$$
\left\|D^{k+2} u\right\|_{L^{p}\left(\Omega^{\prime}\right)} \leq \underset{10}{C\left(\|u\|_{L^{p}(\Omega)}+\|f\|_{W^{k, p}(\Omega)}\right)}
$$

Proof. The argument is based on change of variables and Lemma A.3, and same as Theorem 9.13 in the book [7].

## Appendix B. Proof of Proposition 2.2

Proof. The argument is based on the book by Giga [9].
For every $f \in C_{c}^{\infty}\left((0, T) \times \mathbb{R}_{+}^{d}\right)$, we consider

$$
\left\{\begin{aligned}
\partial_{t} \psi-\Delta \psi=f & \text { in }(0, T] \times \mathbb{R}_{+}^{d} \\
\psi(0, x)=0 & \text { on }\{t=0\} \times \mathbb{R}_{+}^{d}
\end{aligned}\right.
$$

There exists a unique solution

$$
\psi(t):=\int_{0}^{t} e^{-(t-s) A} f(s) d s
$$

where

$$
\begin{array}{r}
e^{-(t-s) A} f=\int_{\mathbb{R}_{+}^{d}}\left(G_{t-s}\left(x^{\prime}-y^{\prime}, x_{d}-y_{d}\right)-G_{t-s}\left(x^{\prime}-y^{\prime}, x_{d}+y_{d}\right)\right) f(s, y) d y \\
G_{t}(x, y)=\frac{1}{(4 \pi t)^{d / 2}} e^{-|x-y|^{2} / 4 t}
\end{array}
$$

Since $f \in C_{c}^{\infty}\left((0, T) \times \mathbb{R}_{+}^{d}\right)$,

$$
\begin{array}{r}
\psi=\psi_{f} \in C\left([0, T] ; W_{0}^{1,1}\left(R_{+}^{d}\right) \cap W^{2,1}\left(R_{+}^{d}\right) \cap C\left(R_{+}^{d}\right)\right) \cap C^{1}\left([0, T] ; L^{1}\left(R_{+}^{d}\right)\right) \\
|\nabla \psi(x)| \leq C\left(1+|x|^{2}\right)^{-d / 2}
\end{array}
$$

(See [8]). We define $\widetilde{\psi}_{f}(t, x):=\psi(T-t, x)$ and then, for every $f \in C_{c}^{\infty}\left((0, T) \times \mathbb{R}_{+}^{d}\right)$,

$$
\begin{aligned}
0 & =\int_{0}^{T} \int_{\mathbb{R}_{+}^{d}} u\left(\partial_{t} \tilde{\psi}_{f}+\Delta \tilde{\psi}_{f}\right) d x d t \\
& =\int_{0}^{T} \int_{\mathbb{R}_{+}^{d}} u\left(-\partial_{t} \psi_{f}+\Delta \psi_{f}\right) d x d t \\
& =-\int_{0}^{T} \int_{\mathbb{R}_{+}^{d}} u f d x d t
\end{aligned}
$$

which implies $u \equiv 0$.
