W e would like to notioe that the issue of the $H$ artreeFock LAPW (linear augm ented plane wave) approach was considered before by S. M assidda, M. Postemak, and A. Baldereschi in Phys. Rev. B 48, pp. 5058-5068 (1993), but we were unaw are of this publication. W e thank D J. Singh and M.W einert for this reference.

Eq. (2.5a) is $m$ issing the contributions from $K \not 0$, i.e. 斗 should read as

$$
\begin{align*}
& { }_{0}^{0}(r)=0(r) \quad \mathrm{P} \overline{4}_{I}(\mathbb{K}=0) \quad \mathrm{Z} \frac{(r)}{4 r^{2}} \\
& \mathrm{p} \overline{4}^{\mathrm{X}} \quad \mathrm{O}_{\mathrm{j} 0}(\mathrm{~K} r)_{\mathrm{I}}\left(\mathbb{K}^{\mathrm{K}}\right):  \tag{2:5a}\\
& \text { K \& } 0
\end{align*}
$$

C orrespondingly, Eqs. (2.11) acquire additional tem s:

$$
\begin{align*}
Q_{0}(r)= & q_{0}(r) \frac{4 r^{3}}{3} I(\mathbb{K}=0) \\
& 4 r^{2} \frac{X_{1}(K r)}{K} I(\mathbb{K}) ;  \tag{2:11a}\\
Q_{0}^{0}(r)= & q_{0}^{0}(r) \quad 2\left(R^{2} \quad r^{2}\right) I(K=0) \\
+ & 4 \quad X^{0}(\cos (K R) \quad \cos (K r)) \frac{I(\mathbb{K})}{K^{2}}:  \tag{2:11b}\\
& K \notin 0
\end{align*}
$$

The additional term s are the last ones in Eq. (2.5a),

Eq. (2.11a) and Eq. (2.11b).
For the cases which we consider in Sec. 3 though this does not $m$ ake any di erenc.

Eq. (3.3) should read as
$\mathrm{E}_{\mathrm{fcc}}=\mathrm{N}=\frac{1}{2} \mathrm{~V}_{0}^{\text {out }} \mathrm{hV}_{\mathrm{I}} \mathrm{i}=1: 2079$ a.u.
$M$ ore details on the $M$ adelung potential are given by $M$. W einert, E. W im mer, and A J. Freem an in Phys. Rev. B 26, 4571 (1982).

W e thank M.W einert for these corrections and for discussing the results of our work.

Finally, for clarity we would like to notice that the exact solutions $V_{04}$ (exact) and $V_{06}$ (exact) in $F$ igures 2 and 3 are given explicitly by

$$
\begin{aligned}
& \mathrm{V}_{04}^{\text {(exact) }}(\mathrm{r})=\mathrm{V}_{04} \frac{\mathrm{r}}{\mathrm{R}}^{4} ; \\
& \mathrm{V}_{06}^{\text {(exact) }}(\mathrm{r})=\mathrm{V}_{06} \frac{\mathrm{r}}{\mathrm{R}}^{6}:
\end{aligned}
$$

H ere $V_{04}=0: 18192, V_{06}=0: 14466$ are exact values at the radius $\mathrm{R}=\quad \overline{2}=4$ (see last row of Table II). Thus, in $F$ igures 2 and 3 we depict the deviations from those exact dependences for tw o solutions (W einert and Ewald) when $r<R$.
