Abstract

The purpose of this research is to study the upper critical field (H_{c2}) of two-band superconductors by two-band Ginzburg - Landau approach. The analytical formula of H_{c2} included anisotropy of order parameter and anisotropy of effective-mass are found. The parameters of the upper critical field in ab-plane $(H_{c2}^{//ab})$ and c-axis $(H_{c2}^{//c})$ can be found by fitting to the experimental data . Finally, we can find the ratio of upper critical field that temperature dependent in the range of experimental result .

Keywords: s-wave superconductor, anisotropy two-band superconductors, Ginzburg-Landau approach

PACS: 74.20.Fg, 74.70.Ad.

1.Introduction

The muti-band characteristic of the superconducting state in MgB₂ [1-3] and nonmagnetic borocarbides(LuNi₂B₂C and Y Ni₂B₂C) [4] and NbSe₂[5] are clearly evident in many measurement. In contrast to conventional superconductors , the upper critical field for a bulk MgB₂,LuNi₂B₂C and Y Ni₂B₂C has a positive curvature near T_c[6-8]. Canfield and Crabtree[9] show the anisotropy of

upper critical field of MgB₂. The anisotropy ,quantified as the ratio $\gamma = \frac{H_{c2}^{//ab}}{H_{c2}^{//c}}$, is not only large,

but it has an unusual temperature dependence. Askerzade [10] study $H_{c1}(T)$ and $H_{c2}(T)$ for MgB₂ and nonmagnetic borocarbides by using the isotropy two-band Ginzberg-Landau model. He shows the complicate formula of critical magnetic field. In the H_{c2} consideration, his formula is less fit to experimental data than Drechsler 's[11]. In the recent work of Dao and Zhitomirsky[12], they study the effect of angular and temperature on upper critical field of MgB₂ determined with the anisotropy two-band Ginzberg-Landau theory. They found that the temperature variation of the ratio of two gaps is responsible for the upward temperature dependence of in-plane H_{c2} as well as for the deviation of its out-of-plane behavior from the standard angular dependence.

In this paper, we study the upper critical magnetic field(H_{c2}) of anisotropy two-band swave superconductors by Ginzburg-Landau theory. We can find the formula of H_{c2} included anisotropy of order parameter and anisotropy of effective-mass. The upper critical field in abplane($H_{c2}^{//ab}$) and c-axis($H_{c2}^{//c}$) can be found by fitting to the experimental data of MgB₂. The anisotropy parameter $\gamma = \frac{H_{c2}^{//ab}}{H_{c2}^{//c}}$ are shown finally.

2.Model and calculation

In the presence of two order parameters, ψ_1 and ψ_2 , in a superconductor, the Ginzburg-Landau free energy can be written as [10,13-15]

$$F[\psi_1,\psi_2] = \int d^3 r(F_1(\psi_1) + F_2(\psi_2) + F_{12}(\psi_1,\psi_2) + \frac{H^2}{8\pi})$$
(1)

with

$$F_{j}(\psi_{j}) = \frac{\hbar^{2}}{4m_{j}} \left| (\nabla - \frac{2\pi i A}{\phi_{0}}) \psi_{j} \right|^{2} + \alpha_{j}(T) \psi_{j}^{2} + \frac{\beta_{j}}{2} \psi_{j}^{4}$$
(2)

$$F_{12}(\psi_1,\psi_2) = \varepsilon(\psi_1\psi_2^* + c.c.) + \varepsilon_1[(\nabla + \frac{2\pi iA}{\phi_0})\psi_1^*(\nabla - \frac{2\pi iA}{\phi_0})\psi_2 + c.c.]$$
(3)

Fj is the free energy of separate bands. \vec{H} is the external magnetic field ($\vec{H} = \nabla x \vec{A}$). α_j, β_j, m_j are the temperature-dependent coefficient, temperature-independent coefficient and mass of the carriers in band j (j=1,2) respectively. $\alpha_j = \lambda_j (T - T_c)$ where λ_j is the temperature-independent constant. The coefficient $\varepsilon, \varepsilon_1$ are the interband mixing of two order parameters and their gradients that ε_1 is equal to zero in Dao and Zhitomirsky[12] s'free energy.

Let there has only magnetic field in z direction, $\vec{H} = H \hat{k}$, and vector potential is in y direction, $\vec{A} = Hx \hat{j}$ that $H = |\vec{H}|$ and x is the displacement. Minimization of the free energy Eq. (1) with respect to the order parameters, ψ_1^* and ψ_2^* , we get[10,13]

$$(\alpha_1(T) + \frac{\hbar He}{2m_1 c})(\alpha_2(T) + \frac{\hbar He}{2m_2 c}) = (\varepsilon - \frac{2He\varepsilon_1}{\hbar c})^2$$
(4)

Let $m_1 = m_2 = m$, we get

$$\left(\frac{\hbar^{2}e^{2}}{4m^{2}c^{2}} - \frac{4\varepsilon_{1}^{2}e^{2}}{\hbar^{2}c^{2}}\right)H_{c2}^{2} + \left((\alpha_{1} + \alpha_{2})\frac{\hbar e}{2mc} + \frac{4\varepsilon\varepsilon_{1}e}{\hbar c}\right)H_{c2} + \alpha_{1}\alpha_{2} - \varepsilon^{2} = 0$$
(5)

We set new parameters to scale Eq.(5) , $\xi_1 = \sqrt{\frac{\hbar^2}{2m\alpha_1}}$, $\xi_2 = \sqrt{\frac{\hbar^2}{2m\alpha_2}}$, $\xi_{12} = \sqrt{\frac{\hbar^2}{2m\varepsilon}}$ that are

the 1st band ,2nd band and interband effective coherence length ,respectively. $\varepsilon_1 = \frac{\kappa \hbar^2}{4m}$ where κ is the gradients of interband mixing of two order parameters in energy unit and $\phi_0 = \frac{2\pi \hbar c}{e}$ that is quantum flux . We find

$$\frac{\pi^2}{\phi_0^2} \left(1 - \kappa^2\right) H_{c2}^2 + \frac{\pi}{\phi_0} \left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right) H_{c2} + \frac{1}{4} \left(\frac{1}{\xi_1^2 \cdot \xi_2^2} - \frac{1}{\xi_{12}^4}\right) = 0$$
(6)

By making the approximation within the condition $0.5 < \kappa < 1$, and keeping some of the lower order term, the analytical equation of upper critical field is

$$H_{c2} = -\frac{\phi_0}{2\pi\xi_{12}^2} \left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right) \left[\frac{1}{1-\kappa^2} - \frac{\left(\frac{\xi_{12}^2}{\xi_1^2\xi_2^2} - 1\right)}{\left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right)^2} + \frac{(1-\kappa^2)\left(\frac{\xi_{12}^2}{\xi_1^2\xi_2^2} - 1\right)^2}{\left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right)^4}\right]$$
(7)

The derivation of Eq.(7) from Eq.(6) is shown in an appendix.

Eq.(7) can be reduced to H_{c2} of single band superconductors, $H_{c2} = \frac{\phi_0}{2\pi\xi^2}$, by taking $\alpha_2 = \varepsilon = \varepsilon_1 = 0$.

3. Anisotropic mass tensor model

Let us consider the two-band s-wave superconductor that shows the layered property. In the layered superconductors, since the overlap of electron wave function is larger within the layers than between layers, it can be assumed that the electrons have a high effective mass for motion normal to the layers and a low effective mass for motion within a layer. Let the mass tensor $\{m\}$ has the form [16]

$$\{m\} = \begin{pmatrix} m & 0 & 0 \\ 0 & m & 0 \\ 0 & 0 & M \end{pmatrix}$$
(8)

where M > m. Since the coherence length ξ depends on the effective mass as $\xi \alpha \frac{1}{\sqrt{m}}$, the coherence length also becomes a tensor and given by

3

$$\{\xi\} = \begin{pmatrix} \xi & 0 & 0 \\ 0 & \xi & 0 \\ 0 & 0 & \delta\xi \end{pmatrix}$$
(9)

where $\delta = \sqrt{m/M}$.

The effect of anisotropy mass tensor on the upper critical field is included by replace ξ in Eq.(7) with coherence length tensor $\{\xi\}$. The calculation procedure is as same as reference [16], then we get

$$H_{c2} = -\frac{\phi_{0}}{2\pi\xi_{12}^{2}(\sin^{2}\theta + \delta^{2}\cos^{2}\theta)} (\frac{\xi_{12}^{2}}{\xi_{1}^{2}} + \frac{\xi_{12}^{2}}{\xi_{2}^{2}} + 2\kappa) [\frac{1}{1-\kappa^{2}} - \frac{(\frac{\xi_{12}^{2}}{\xi_{1}^{2}}\xi_{2}^{2} - 1)}{(\frac{\xi_{12}^{2}}{\xi_{1}^{2}} + \frac{\xi_{12}^{2}}{\xi_{2}^{2}} + 2\kappa)^{2}} + \frac{(1-\kappa^{2})(\frac{\xi_{12}^{4}}{\xi_{1}^{2}} + \frac{\xi_{12}^{2}}{\xi_{2}^{2}} - 1)^{2}}{(\frac{\xi_{12}^{2}}{\xi_{1}^{2}} + \frac{\xi_{12}^{2}}{\xi_{2}^{2}} + 2\kappa)^{4}}]$$
(10)

Here θ is the angle between magnetic field and the layer of superconductor.

We consider the MgB₂ superconductor. MgB₂ has a hexagonal crystal structure and the anisotropy is most likely to occur along the c-direction similar to other hexagonal crystal such as U Pt₃ and U Pd₂Al₃. We can concluded that MgB₂ is a layered superconductor with anisotropy by the nature of the crystal structure. It is seem that H_{C2} of MgB₂ can be described by Eq.(10). On the recent paper of Koshelev and Golubov[17], they propose that MgB₂ can not be described by the anisotropy mass Ginzberg-Landau theory. The anisotropy mass Ginzberg-Landau theory has a temperature-limited to describe H_{c2} of MgB₂ less than 2% away from T_c. Since such a small temperature region is difficult to accurately probe experimentally, one may say that there is a complete breakdown of anisotropic mass Ginzberg-Landau theory in MgB₂. Although this model can not describe the H_{c2} of MgB₂ superconductor, we think that this model should be suitable for the other two-band s-wave superconductors.

4. Anisotropic order parameters

Here we make the assumption that order parameters are proportioned to the energy gaps , $\psi \alpha \Delta$, [18]. We can write the order parameters in the form

$$\psi = \psi_0(T)f(\bar{k}) \tag{11}$$

where $f(\vec{k})$ is the anisotropy function . \vec{k} is the wave vector. In MgB₂ superconductor, there are many kinds of anisotropy function proposed by researchers [19-21].

Substitution Eq.(11) into Eq.(1), we can get the formula of H_{c2} as

$$H_{c2} = -\frac{\phi_0}{2\pi\xi_{12}^{\prime 2}} \left(\frac{\xi_{12}^{\prime 2}}{\xi_1^2} + \frac{\xi_{12}^{\prime 2}}{\xi_2^2} + 2\sqrt{\Omega}\kappa\right) \left[\frac{1}{1 - \Omega\kappa^2} - \frac{\left(\frac{\xi_{12}^{\prime 2}}{\xi_1^2 + \xi_2^2} - 1\right)}{\left(\frac{\xi_{12}^{\prime 2}}{\xi_1^2} + \frac{\xi_{12}^{\prime 2}}{\xi_2^2} + 2\sqrt{\Omega}\kappa\right)^2} + \frac{\left(1 - \Omega\kappa^2\right)\left(\frac{\xi_{12}^{\prime 4}}{\xi_1^2 + \xi_2^2} - 1\right)^2}{\left(\frac{\xi_{12}^{\prime 2}}{\xi_1^2} + \frac{\xi_{12}^{\prime 2}}{\xi_2^2} + 2\sqrt{\Omega}\kappa\right)^4}\right]$$
(12)

where

 $\Omega = \frac{\left\langle f_1(\hat{k}) f_2(\hat{k}) \right\rangle^2}{\left\langle f_1^2(\hat{k}) \right\rangle \left\langle f_2^2(\hat{k}) \right\rangle} \quad \text{and} \quad \xi_{12}' = \sqrt{\frac{\hbar^2}{2m\varepsilon_1 \sqrt{\Omega}}} = \frac{\xi}{\Omega^{1/4}}.$

<.....> is the averaged over Fermi surface. $f_1(k)$ and $f_2(k)$ are the anisotropy function of first and second band.

In case of the symmetry gap $f_1(k) = f_2(k) = 1$, that gives $\Omega = 1$. Eq.(12) will be reduced to be Eq.(7). Let us consider the anisotropy model of Haas and Maki[19], $f(\theta) = \frac{1 + a' \cos^2 \theta}{1 + a'}$. Here θ is the polar angle and a' is anisotropy parameter. We assume that both band have the same anisotropy function, but they have the difference in anisotropy parameter $f_1(\theta) = \frac{1 + a' \cos^2 \theta}{1 + a'}$.

and
$$f_{2}(\theta) = \frac{1+b'\cos^{2}\theta}{1+b'}$$
. In this model, the averaged over Fermi surface is
 $< f(\theta) >= \frac{1}{2} \int_{0}^{\pi} d\theta \sin \theta \ f(\theta)$ that $< f_{1}^{2}(\theta) >= \frac{15+10a'+3a'^{2}}{15(1+a')^{2}}$ and
 $< f_{1}(\theta)f_{2}(\theta) >= \frac{5(3+b')+a'(5+3b')}{15(1+a')(1+b')}$. We get $\Omega = \frac{(5(3+b')+a'(5+3b'))^{2}}{(15+a'(10+3a'))(15+b'(10+3b'))}$. If

a' = b', we get $\Omega = 1$. This means that if each band has the same anisotropy function and anisotropy parameter, the anisotropy will show no effect on H_{c2} . For our consideration, Ω is dependent on anisotropy parameters. If we know the values of anisotropy parameters, we can get the value of Ω . For simplify, we will consider Ω as a constant parameter.

We consider the experimental data of MgB₂ and make the assumption that the upper critical field in ab-plane($H_{c2}^{//ab}$) and c-axis($H_{c2}^{//c}$) can be found by set of the suitable parameters .We can write Eq.(12) in form that $H_{c2} = H_{c2}(a_1, a_2, \Omega, \kappa)$, where $a_1 = \frac{\hbar^2}{2m\lambda_1}$, $a_2 = \frac{\hbar^2}{2m\lambda_2}$. After fitting Eq.(12) to the experimental data of upper critical field of single crystal MgB₂[22-24], the upper critical field in ab-plane($H_{c2}^{//ab}$) is $H_{c2}^{//ab} = H_{c2}(6.5, 6.5, 0.7, 0.5)$, and in c-axis($H_{c2}^{//c}$) is $H_{c2}^{//ab} = H_{c2}(13, 13, 0.7, 0.5)$, as shown in Fig.(1). In Figure.(2), the ratio of upper critical field ($\gamma = \frac{H_{c2}^{//ab}}{H_{c2}^{//ab}} = \frac{H_{c2}(6.5, 6.5, 0.7, 0.5)}{H_{c2}^{//ab}}$) versus temperature is shown. The maximum ratio γ at T=0 K

is equal to 2.0 .Our result is in range of 1 to 13 [20] and when temperature is increased, γ is decreased. (although, it is almost constant in low temperature region). This behavior agree with the result of Miranovic', Machida and Kogan[21] and Canfield and Crabtree[9].

5. Conclusion

The effect of an anisotropy in mass tensor and an anisotropy of order parameters on upper critical field are considered in our model. We use model of an anisotropic order parameters on upper critical field in our numerical calculation to compare to experimental data of MgB₂. The parameters of the upper critical field in ab-plane($H_{c2}^{//ab}$) and c-axis($H_{c2}^{//c}$) can be found by fitting to the experimental data .Finally, we can find the ratio of upper critical field that depend on

temperature in the range of experimental result. Our model can find the ratio of $\gamma = \frac{H_{c2}^{//ab}}{H_{c2}^{//c}}$ at

T=0 K equal to 2.0.

Appendix

In this appendix, we would like to show how to get H_{c2} equation(Eq.(7)) from Eq.(6). And this procedure can be apply to get solution as Eq.(10) and (12) also. Consider Eq.(6) that

$$\frac{\pi^2}{\phi_0^2} \left(1 - \kappa^2\right) H_{c2}^2 + \frac{\pi}{\phi_0} \left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right) H_{c2} + \frac{1}{4} \left(\frac{1}{\xi_1^2 \cdot \xi_2^2} - \frac{1}{\xi_{12}^4}\right) = 0$$
(6)

Since Eg.(6) is a quadratic equation, we can get solution as

$$H_{c2} = -\frac{\phi_0}{2\pi(1-\kappa^2)} \left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right) \pm \frac{\phi_0}{2\pi(1-\kappa^2)} \left(\left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right)^2 - (1-\kappa^2)\left(\frac{1}{\xi_1^2\xi_2^2} - \frac{1}{\xi_{12}^4}\right)\right)^{1/2}$$
(A1)

Eq.(A1) has two terms in square root that we can make the approximation by considering these two terms. It can be considered into two cases.

Case I For
$$(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2})^2 >> (1 - \kappa^2)(\frac{1}{\xi_1^2\xi_2^2} - \frac{1}{\xi_{12}^4})$$

By making the approximation, Eq.(A1) become

$$H_{c2}^{(-)} = -\frac{\phi_0}{2\pi(1-\kappa^2)} \left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right) + \left(\frac{1}{2}\right) \frac{\phi_0}{2\pi} \frac{\left(\frac{1}{\xi_1^2\xi_2^2} - \frac{1}{\xi_{12}^4}\right)}{\left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right)} - \left(\frac{1}{8}\right) \frac{\phi_0}{2\pi} \frac{(1-\kappa^2)\left(\frac{1}{\xi_1^2\xi_2^2} - \frac{1}{\xi_{12}^4}\right)^2}{\left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right)^3}$$

(A2)

and

$$H_{c2}^{(+)} = -\left(\frac{1}{2}\right)\frac{\phi_{0}}{2\pi}\frac{\left(\frac{1}{\xi_{1}^{2}\xi_{2}^{2}} - \frac{1}{\xi_{12}^{4}}\right)}{\left(\frac{1}{2\xi_{1}^{2}} + \frac{1}{2\xi_{2}^{2}} + \frac{\kappa}{\xi_{12}^{2}}\right)} + \left(\frac{1}{8}\right)\frac{\phi_{0}}{2\pi}\frac{\left(1 - \kappa^{2}\right)\left(\frac{1}{\xi_{1}^{2}\xi_{2}^{2}} - \frac{1}{\xi_{12}^{4}}\right)^{2}}{\left(\frac{1}{2\xi_{1}^{2}} + \frac{1}{2\xi_{2}^{2}} + \frac{\kappa}{\xi_{12}^{2}}\right)^{3}}$$
(A3)

$$\frac{\text{Case II}}{\text{Case II}} \quad \text{For } \left(\frac{1}{2\xi_{1}^{2}} + \frac{1}{2\xi_{2}^{2}} + \frac{\kappa}{\xi_{12}^{2}}\right)^{2} <<\left(1 - \kappa^{2}\right)\left(\frac{1}{\xi_{1}^{2}\xi_{2}^{2}} - \frac{1}{\xi_{12}^{4}}\right).$$
By making the approximation , Eq.(A1) become

$$H_{c2}^{(-)} = -\frac{\phi_{0}}{2\pi\left(1 - \kappa^{2}\right)}\left(\frac{1}{2\xi_{1}^{2}} + \frac{1}{2\xi_{2}^{2}} + \frac{\kappa}{\xi_{12}^{2}}\right) - \frac{\phi_{0}}{2\pi}\sqrt{\frac{\frac{1}{\xi_{1}^{4}} - \frac{1}{\xi_{1}^{2}\xi_{2}^{2}}}{1 - \kappa^{2}}} - \frac{\phi_{0}}{4\pi}\frac{\left(\frac{1}{2\xi_{1}^{2}} + \frac{1}{2\xi_{2}^{2}} + \frac{\kappa}{\xi_{12}^{2}}\right)^{3}}{\left(1 - \kappa^{2}\right)^{3/2}\sqrt{\frac{1}{\xi_{12}^{4}} - \frac{1}{\xi_{1}^{2}\xi_{2}^{2}}}}$$
(A3)

and

$$H_{c2}^{(+)} = \frac{\phi_0}{2\pi(1-\kappa^2)} \left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right) + \frac{\phi_0}{2\pi} \sqrt{\frac{\frac{1}{\xi_{12}^4} - \frac{1}{\xi_1^2\xi_2^2}}{1-\kappa^2}} + \frac{\phi_0}{4\pi} \frac{\left(\frac{1}{2\xi_1^2} + \frac{1}{2\xi_2^2} + \frac{\kappa}{\xi_{12}^2}\right)^2}{\left(1-\kappa^2\right)^{3/2} \sqrt{\frac{1}{\xi_{12}^4} - \frac{1}{\xi_1^2\xi_2^2}}}$$
(A5)

We have obtained four formula for the solution of Eq.(6). Next step, we will check the conditions to get physical solution of Eq.(6). We have the critical magnetic field of one band model as $H_{c2} = \frac{\phi_0}{2\pi\xi^2}$. Two band model can be reduced to one band model if we set $\alpha_2 = \varepsilon = \varepsilon_1 = 0$. Eq. (A3) is not reduced to the one-band 's result. So Eq(A2), Eq.(A4), and Eq.(A5) can be the solution of two band model . We assume the next condition that $\frac{1}{2} < \kappa < 1$.Only Eq.(A2) satisfies this condition. Finally, the analytical equation of upper critical field is Eq.(A2) and we can rewrite to be

$$H_{c2} = -\frac{\phi_0}{2\pi\xi_{12}^2} \left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right) \left[\frac{1}{1-\kappa^2} - \frac{\left(\frac{\xi_{12}^2}{\xi_1^2\xi_2^2} - 1\right)}{\left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right)^2} + \frac{(1-\kappa^2)\left(\frac{\xi_{12}^4}{\xi_1^2\xi_2^2} - 1\right)^2}{\left(\frac{\xi_{12}^2}{\xi_1^2} + \frac{\xi_{12}^2}{\xi_2^2} + 2\kappa\right)^4}\right]$$
