#### Abstract

The ground state properties and neutron structure factor for the two-dim ensional antiferrom agnet on the triangular lattice, w ith uni-directional anisotropy in the nearest-neighbor exchange couplings and a weak D zyaloshinskii-M oriya (D M ) interaction, are studied. This H am iltonian has been used to interpret neutron scattering $m$ easurem ents on the spin $1=2$ spiral spin-density-w ave system, $C_{s_{2}} C_{u C l}, \mathbb{R}$. Coldea, et al., Phys. Rev. B 68, 134424 (2003)]. C alculations are perform ed using a $1=S$ expansion, taking into account interactions betw een spin-w aves. The ground state energy, the shift of the ordering $w$ ave-vector, $Q$, and the localm agnetization are all calculated to order $1=S^{2}$. T he neutron structure factor, obtained using anharm on ic spin-w ave $G$ reen's functions to order $1=S$, is show $n$ to be in reasonable agreem ent $w$ ith published neutron data, provided that slightly di erent param eters are used for the exchange and DM interactions than those inferred from $m$ easurem ents in high $m$ agnetic eld.

## I. INTRODUCTION

There is enorm ous interest in the condensed m atter com $m$ unity in the possibility of observing fractionalized quasiparticles in tw o or three dim ensionalelectronic system $\mathrm{s}^{1,2,3}$ Fractionalization is the rule, rather than the exception, in one dim ensional $m$ etals where electronic spin and charge propagate independently ${ }^{4}$ Fractionally charged quasiparticles have also been found in the tw o dim ensionalelectron gas in high m agnetic elds where the fractional quantum H alle ect is observed. 5 O n the theoretical side, fractionalization has recently been argued to exist in frustrated two-dim ensional quantum model system $s, 6,7$ although no corresponding experim ental system s have yet been con m ed. A set of long-w avelength theories have been developed that describe the properties of putative fractionalized m agnets 8,9,10 Subsequently, the theoreticalm odeling ofpossible fractionalized phases w as extended to a w ide variety ofstrongly correlated electron system $\mathrm{S}^{11,12,13} \mathrm{~T}$ he discovery of fractionalization in real two or three dim ensional system s in zero m agnetic eld would provide a striking exam ple of the em ergence of new kinds of particles from the collective behavior of strongly interacting electrons. ${ }^{1}$

A s a result of this intense interest, the recent claim of the observation of spinons, neutral, spin $1 / 2$ quasiparticles, in the insulating antiferrom agnet $\mathrm{Cs}_{2} \mathrm{CuC} l_{4}$ has attracted considerable attention $14,15 \mathrm{Cs}_{2} \mathrm{CuC} l_{4}$ consists of nearly uncoupled layers of coupled chains. T he chains are staggered, so that each spin interacts equally $w$ ith two spins on each of tw o neighboring chains, w ith an antiferrom agnetic coupling, $\mathrm{J}^{0}$, about $1 / 3$ the strength of the intrachain antiferrom agnetic nearest neighbor coupling, J. The layer thus resem bles a triangular lattice, w ith strong interactions along one direction and weaker interactions in the transverse directions. T hese intralayer
couplings, $J$ and $J^{0}$ assisted by a $m$ uch w eaker interlayer coupling $J^{\infty}$, stabilize an incom $m$ ensurate spin density wave (SDW ) ground state $w$ ith a wave vector oriented along the chain direction. A w eak D zyaloshinskii-M oriya (D M ) interaction $D$ is believed to orient the spins in the 2D layer.

C oldea and cow orkens ${ }^{14,15}$ used neutron scattering to study spin-w ave excitations from this ordered ground state. W hile C oldea et al. did observe excitations sim ilar to what is expected for spin-waves, they also saw broad features which they intenpreted as excitations of pairs of spinons. Their idea is that the higher energy spin excitations resem ble excitations from a nearby-lying spin-liquid state that supports fractionalized excitations. $T$ he low -dim ensional nature of the system together $w$ ith the low spin are argued to place this system close to a quantum critical point separating the ordered SDW state from a 2D spin liquid state. This con jecture has stim ulated a num ber of theoretical studies of possible 2D spin-liquid states that could account for the observed behavior 16,17,18,19,20,21,22

In this paper, we pursue a di erent interpretation of the neutron data, nam ely that low spin and quasi-onedim ensionality, along w th non-collinear SDW order, all give rise to substantialanharm onic interactions that couple one- and two-spinw ave excitations from the ordered state. T he coupling to two spinw ave states also yields broad spectra as seen in the neutron data. A sim ilar conclusion has been reached by V eillette et al. ${ }^{23}$ who also noted that the low m om entum resolution of the neutron data is another signi cant factor in the observed breadth of the spectra. W e nd that anharm onic e ects lead to signi cantbroadening of the neutron spectra but are sensitive to anisotropies, such as the D M interaction, which suppress quantum uctuations. W e show in particular that, if such anisotropies are weak, then quantum uc-
tuations, described in term s of a $1=S$ expansion about the $m$ ean eld SDW state, reduce the localm om ent and lead to substantial renorm alizations and broadening of the excitation spectra.

T he rest of this paper is organized as follow s . In Sec . II we describe the Ham iltonian and the SDW state of $\mathrm{Cs}_{2} \mathrm{CuCl}_{4}$. In Sec. III we show how anharm onic e ects $m$ odify the ground state energy and the $w$ ave vector $Q$ of the SDW to order $1=S^{2}$, and we also review the calculation of the anharm onic one-spin-w ave $G$ reen's functions to order 1=S. In Section IV we calculate the sublattioe $m$ agnetization $M$ to order $1=S^{2}$ as a function of the ratio $J^{0}=J$ and strength of $D M$ interaction $D=J$, show ing that the renorm alized value of $M$ depends sensitively on the ratio $D=J$ for sm all $D=J$. In Sec. $V$ we exam ine expressions for the anharm onic spin-w ave energies and dam ping to order $1=S$. For $D=0$ we study how the Goldstone $m$ ode at $Q$ is preserved and show how the preservation of this zero energy mode can be used to de ne a set of renorm alized coupling constants. Section V I review s the calculation of the neutron structure factor and presents a detailed com parison to the inelastic data of C oldea et al. for speci $\mathrm{c} w$ ave vectors $w$ here tw o-m agnon scattering is im portant. In Sec. V II we discuss the im plications of our theoretical calculations in interpreting existing data on $\mathrm{Cs}_{2} \mathrm{CuC} l_{4}$. W e also m ake suggestions for possible new experim ents.

## II. SP IN DENSITY W AVE STATE FOR C $\mathrm{s}_{2} \mathrm{CuC} \mathrm{l}_{4}$

The spin density wave state of $\mathrm{Cs}_{2} \mathrm{CuCl}_{4}$ can be described by the sim ple, m odel H am iltonian for a set of decoupled layers:

$$
\begin{array}{rlll}
H= & X & J S_{R} & \mathrm{~S}+{ }_{1}+{ }_{2}+J^{0} \mathrm{~S}_{\mathrm{R}} \quad\left(\mathrm{~S}+{ }_{1}+\mathrm{S}_{\mathrm{R}+}{ }_{2}\right) \\
& \mathrm{R} & (1)^{\mathrm{n} D} & \mathrm{~S} \\
& \left(\mathrm{~S}_{\mathrm{R}+{ }_{1}}+\mathrm{S}_{\mathrm{R}+{ }_{2}}\right) ; \tag{1}
\end{array}
$$

where $J$ is the nearest neighbor coupling constant betw een $S=1=2 \mathrm{Cu}^{2+}$ spins along chains in one direction, which we take to be the $x$-direction in a triangular lattice, while $\mathrm{J}^{0}$, is the coupling constant along the other two principal directions in each layer as illustrated in Fig. 1. B oth $J$ and $J^{0}$ are antiferrom agnetic, and $J>J^{0}$. $T$ he last term in Eq. (1) w ith $D=(0 ; D ; 0)$ describes the D zyaloshinskiim oriya interaction that altemates in sign betw een even and odd layers labeled by index $n$.

Values of the coupling constants, determ ined from m easurem ents in high m agnetic elds, ${ }^{24}$ are:

$$
\begin{gather*}
J=0: 374 \mathrm{meV} ; \quad \mathrm{J}^{0}=0: 128 \mathrm{meV} \quad \mathrm{~J}=3 ;  \tag{2}\\
\mathrm{D}=0: 02 \mathrm{~m} \mathrm{eV} ; \tag{3}
\end{gather*}
$$

leading to a sm all $N$ eel tem perature $T_{N}$ of less than 1 K in the presence of the interlayer coupling $J^{\infty}$. T he interlayer coupling is su ciently sm all ( $\left.\mathrm{J}^{\infty}=\mathrm{J}=0: 045\right)^{24}$ that

F IG . 1: Exchange couplings betw een the di erent sites of the triangular lattice w ithin a single layer.
we neglect it in our calculations perform ed at $T=0$. $T$ he classical ground state for th is H am iltonian is a SD W whose $w$ ave vector $Q_{0}$ is along the strong-coupling direction and has the value

$$
\begin{equation*}
Q_{0}=2(0: 5+\quad) ; \tag{4}
\end{equation*}
$$

where experim entally, $=0: 030(2)$ is found for $\mathrm{C} \mathrm{s}_{2} \mathrm{CuCl}_{4} \stackrel{24}{24}^{20}$ that $Q_{0}$ is close to .

This m eans that individual chains are ordered approxim ately antiferrom agnetically, while the spins in adjacent chains, which are slipped by half a lattice spacing along the chain direction, are approxim ately orthogonal.

To fiurther ilhustrate this point, consider the calculation of the classical ground state energy of the SDW state, that can be easily determ ined by introducing a local reference fram $e$, so that at every site the averaged spin is directed along the axis:

$$
\begin{gather*}
S_{R}^{X}=S_{R} \cos (Q \quad R) \quad S \sin (Q \quad R) ; \\
\left.S_{R}^{Z}=S_{R} \sin (Q \quad R)+\underset{R}{\cos (Q} \quad R\right) ; \\
S_{R}^{Y}=S_{R}: \tag{5}
\end{gather*}
$$

In Eqs. (5), $Q$ is the $w$ ave vector of the spiral structure, which at the classical level we w rite as $\left(Q_{0} ; 0 ; 0\right)$ where $Q_{0}$ changes sign from layer to layer. $Q_{0}$ is determ ined from m inim ization of the classical ground state energy w ith $\mathrm{S}_{\mathrm{R}}=\mathrm{S}_{\mathrm{R}}=0$ for all R . The classical ground state energy (per spin) is given by

$$
\begin{gather*}
S^{2} E_{G}^{(0)}(Q)=S^{2} J_{Q}^{T}  \tag{6}\\
J_{Q}^{T}=J_{Q} \quad i D_{Q} ; \tag{7}
\end{gather*}
$$

where

$$
\begin{equation*}
J_{k}=J \cos k_{x}+2 J^{0} \cos \frac{k_{x}}{2} \cos \frac{\mathrm{p}}{3 k_{\mathrm{y}}} \tag{8}
\end{equation*}
$$

and

$$
\begin{equation*}
D_{k}=2 i D \sin \frac{k_{x}}{2} \cos \frac{\mathrm{P} \overline{3} k_{\mathrm{y}}}{2} \tag{9}
\end{equation*}
$$

are the Fourier transform s of the exchange and DM interactions of the H am ittonian respectively.

For $D=0$, in Eq. (4) is given by

$$
\begin{equation*}
=\frac{1}{-\arcsin } \frac{J^{0}}{2 J}=0: 0547 ; \tag{10}
\end{equation*}
$$

while for $D=0: 02 \mathrm{meV}$, the value of $Q_{0}$ that m ini$m$ izes the classical ground state energy corresponds to
$=0: 0533$ for the experim ental values of $J$ and $J^{0}$. The tw o tem s in Eq. (8), represent the intrachain and interchain energies respectively. Substituting the actual value of $Q_{0}$ for a given $J^{0}=J$ and $D=0$, we nd that

$$
\begin{equation*}
S^{2} E_{G}^{(0)}\left(Q_{0}\right)=J S^{2} 1+\frac{J^{\propto}}{2 J^{2}}: \tag{11}
\end{equation*}
$$

Thus the contribution to the ground state energy from the interchain coupling is of order $\left(\mathrm{J}^{0}\right)^{2}=\mathrm{J}^{2}$ com pared to the intrachain contribution. Quantum uctuations reduce the e ectiveness of interchain coupling further by renorm alizing the SD W w ave vector to a value even closer to (corresponding to a sm aller e ective $J^{0}=J$ ). At the sam e tim e, quantum uctuations low er the total energy. $T$ hus if one were to m odel the e ects of quantum uctuations in term $s$ of e ective coupling constants, $J$ and $J^{0}$, the result would be $J^{0}=\tau<J^{0}=J$ and $\tau>J$. As is show $n$ in the next section and in A ppendix $A$, the value of obtained at the classical level, is in fact considerably renorm alized by quantum uctuations.
III. $1 / \mathrm{S}$ EXPANSION

To address the physics determ ined by quantum uctuations, we em ploy the well-known H olstein $-P$ rim ako transform ation for the spin operators. ${ }^{25}$

$$
\begin{align*}
& S_{R}=S_{R} \quad i S_{R} \quad p \overline{2 S} a_{R}^{y} \quad 1 \quad \frac{1}{4 S} a_{R}^{y} a_{R} ;  \tag{12}\\
& S_{R}^{+}=S_{R}+i S_{R} \quad P \overline{2 S} 1 \quad \frac{1}{4 S} a_{R}^{y} a_{R} \quad a_{R} ; \tag{13}
\end{align*}
$$

$$
\begin{equation*}
S_{R}=S \quad a_{R}^{Y} a_{R}: \tag{14}
\end{equation*}
$$

These are written in a form with the square root expanded to rst order in $1=(2 S)$. The $m$ agnon operators $a_{R}^{Y}, a_{R}$ describe excitations around the spiral ground state and obey Bose statistics. Substituting the transform ations (12)-(14) into Eq. (1), we obtain the H am irtonian for interacting $m$ agnons,

$$
\begin{equation*}
\mathrm{H}=\mathrm{S}^{2} \mathrm{E}_{\mathrm{G}}^{(0)}(\mathrm{Q})+\left(\mathrm{H}^{(2)}+\mathrm{H}^{(3)}+\mathrm{H}^{(4)}\right) ; \tag{15}
\end{equation*}
$$

where in the Fourier transform ed representation

$$
\begin{equation*}
H^{(2)}=2 S^{X} \quad A_{k} a_{k}^{y} a_{k} \quad \frac{B_{k}}{2}\left(a_{k}^{y} a_{k}^{y}+a_{k} a_{k}\right):( \tag{16}
\end{equation*}
$$

The functions ${ }^{k} A_{k}$ and $B_{k}$ are expressed through $J_{k}$ as

$$
\begin{gather*}
A_{k}=\frac{1}{4} J_{Q+k}^{T}+J_{Q}^{T} k+\frac{J_{k}}{2} J_{Q}^{T} ;  \tag{17}\\
B_{k}=\frac{J_{k}}{2} \frac{1}{4} J_{Q+k}^{T}+J_{Q}^{T} k: \tag{18}
\end{gather*}
$$

The interactions betw een $m$ agnons are described by the last two term $\mathrm{SH}{ }^{(3)}$ and $\mathrm{H}^{(4)}$. The three-m agnon term can be w ritten in the form

$$
\begin{align*}
& H^{(3)}=\frac{i}{2}_{\bar{x}^{\frac{S}{2 N}}}^{1 ; 2 ; 3}\left(C_{1}+C_{2}\right)\left(a_{3}^{Y} a_{2} a_{1}\right. \\
& \left.a_{1}^{y} a_{2}^{y} a_{3}\right) 1+2 ; 3 \tag{19}
\end{align*}
$$

that contains the vertex

$$
\begin{equation*}
C_{k}=J_{Q+k}^{T} \quad J_{Q}^{T} k ; \tag{20}
\end{equation*}
$$

which is antisym $m$ etric $w$ ith respect to the transform ation $k$ ! k. For brevity, in longer expressions we use the convention that $1=\mathrm{k}_{1}$, etc.

The four-m agnon term can be conveniently w ritten as:

$$
\begin{align*}
& H^{(4)}=\frac{1}{4 N}{ }_{1 ; 2 ; 3 ; 4} \quad\left[\left(A_{1} 3+A_{1}+A_{2}+A_{2} 4_{4}\right) \quad\left(B_{1} A_{3}+B_{1} 4+B_{2}+B_{2}\right) \quad\left(A_{1}+A_{2}+A_{3}+A_{4}\right)\right]  \tag{21}\\
& a_{1}^{Y} a_{2}^{Y} a_{3} a_{4} 1+2 ; 3+4+\frac{2}{3}\left(B_{1}+B_{2}+B_{3}\right) \quad a_{1}^{Y} a_{2}^{Y} a_{3}^{Y} a_{4}+a_{4}^{Y} a_{3} a_{2} a_{1} \quad 1+2+3 ; 4 ;
\end{align*}
$$

and contains only sym $m$ etric vertices. It is im portant to em phasize that $H^{(3)}$ com es from the coupling between the operators $S_{R}$ and $S_{R}$, which arises for non-collinear ordered states. This term plays a crucial role in calcula-
tions of the structure factor as well as in renorm alization of the energy spectrum .

T o proceed, one needs to diagonalize the quadratic part of the $H$ am iltonian Eq. (16) by $m$ eans of the B ogoliubov
transform ation:

$$
\begin{align*}
& a_{k}=u_{k} C_{k}+v_{k} C_{k}^{y} ; \quad a_{k}^{y}=u_{k} C_{k}{ }_{k}+v_{k} C_{k} ;  \tag{22}\\
& u_{k}=\frac{r}{\frac{A_{k}+~_{k}}{2 n_{k}}} ; \quad v_{k}=\operatorname{sgnB}_{k} \frac{\overline{A_{k} n_{k}}}{2 "_{k}}: \tag{23}
\end{align*}
$$

The energy spectrum in the above equations is given by:

$$
\begin{align*}
"_{k} & =q \overline{A_{k}^{2} \quad B_{k}^{2}} \\
& =\frac{\left(J_{k} \quad J_{Q}^{T}\right) \quad\left(J_{Q+k}^{T}+J_{Q}^{T} \quad k\right)=2 \quad J_{Q}^{T}}{} \quad: \tag{24}
\end{align*}
$$

For $D=0$, the $m$ agnon spectrum has zeros at $k=0$ and $\mathrm{k}=\mathrm{Q}$ in the two-dim ensionalB rillouin zone, while a non $\vec{r}$ ero $D$ leads to the appearance of a nite gap of order $\overline{\mathrm{D} J}$ around the $Q$-points. A fter diagonalization, $H^{(2)}$ takes the form :

$$
\begin{gather*}
H^{(2)}=S E_{G}^{(1)}(Q)+\frac{2 S}{N}_{k}^{X} "_{k} C_{k}^{y} C_{k} ;  \tag{25}\\
E_{G}^{(1)}(Q)=J_{Q}^{T}+\frac{1}{N}_{k}^{X} "_{k}: \tag{26}
\end{gather*}
$$

The contribution $\operatorname{SE}_{\mathrm{G}}{ }^{(1)}(\mathrm{Q})$ gives the leading $1=(2 \mathrm{~S})$ correction to the classical ground state energy Eq. (6). $M$ inim izing the sum $S^{2} E_{G}^{(0)}(Q)+\operatorname{SE}_{G}^{(1)}(Q)$, we nd the quantum correction to the classical value $Q_{0}$. To order $1=S$ the shifted $w$ ave vector is $Q=(Q ; 0 ; 0)$

$$
\begin{gather*}
Q=Q_{0}+\frac{Q^{(1)}}{2 S} ;  \tag{27}\\
Q^{(1)}=\frac{Q^{2} J_{Q}^{T}}{@ Q^{2}} \frac{1}{N}_{k}^{X} \frac{\left(A_{k}+B_{k}\right)}{n_{k}} \frac{Q J_{Q+k}^{T}}{@ Q} Q_{0} \tag{28}
\end{gather*}
$$

In the absence of the DM interaction,

$$
\begin{equation*}
\mathrm{Q}^{(1)}=2=0: 0324 ; \tag{29}
\end{equation*}
$$

while for $D=0: 02 \mathrm{meV}$,

$$
\begin{equation*}
Q^{(1)}=2=0: 0228: \tag{30}
\end{equation*}
$$

W e see that inclusion of the D zyaloshinskii-M oriya interaction suppresses the renorm alization of $Q$ tow ards .

It is possible to go further and also calculate the correction to the ground state energy and the ordering $w$ ave vector $Q$ that is of order $1=(2 S)^{2}$. T he details of those calculations are presented in A ppendix A. T he results indicate that quantum corrections com puted order by order in $1=(2 S)$ are signi cant for the values of $J$ and $J^{0}$ given by Eqs. (2). To further explore this issue, one can com pare the classical ground state energy Eq. (6) to its leading renorm alization due to quantum uctuations $S E_{G}^{(1)}\left(Q_{0}\right) . W e n d$, for $D=0$

$$
S^{2} E_{G}^{(0)}\left(Q_{0}\right)=J=0: 265 ; S_{G}^{(1)}\left(Q_{0}\right)=J=0: 157 ;(31)
$$

and, for $D=0: 02 \mathrm{meV}$,

$$
S^{2} E_{G}^{(0)}\left(Q_{0}\right)=J=0: 291 ; \quad S E_{G}^{(1)}\left(Q_{0}\right)=J=0: 138:(32)
$$

W e see that the leading quantum correction lowers the ground state energy by about 50\%, giving reasonable agreem ent $w$ ith a recent experim ental determ ination of this quantity, based on susceptibility m easurem ents, ${ }^{26}$ which yields a ground state energy slightly above $0: 5 \mathrm{~J}$. W e show in Appendix A that for $\mathrm{D}=0$ the next order in $1=(2 S)$ correction reduces the ground state energy by a further 10 percent below the sum of the values given in Eq. (31), bringing the totalw ithin a few percent of the experim ental value.

To calculate physical observables, we need the G reen's functions for the $m$ agnon operators $a_{k}$. $T$ hey can be conveniently w ritten in the form of a $2 \quad 2 \mathrm{~m}$ atrix, indicating the presence of nom al and anom alous parts. At zero tem perature, the de nition reads
where $\hat{T}$ is the tim e ordering operator, and the average is taken w ith respect to the ground state. $T$ he inverse of the $m$ atrix for the bare $G$ reen's functions has the form ${ }^{29}$

$$
\hat{G}^{(0)}{ }^{1}(\mathrm{k} ;!)=\quad!\quad \begin{align*}
& 2 \mathrm{SA}_{\mathrm{k}}+\mathrm{i}  \tag{34}\\
& 2 \mathrm{SB}_{\mathrm{k}}
\end{aligned} \quad!\quad \begin{aligned}
& 2 \mathrm{SB}_{\mathrm{k}} \\
& 2 \mathrm{SA}_{\mathrm{k}}+i
\end{align*}
$$

corresponding to the $G$ reen's function
where $!_{k}=2 S{ }^{k} . T$ he selfenergy ${ }^{\wedge}(\mathrm{k} ;!)$ determ ining the exact $G$ reen's function is also a 2 matrix, that can be param etrized as

$$
{ }^{\wedge}(k ;!)=\begin{array}{cc}
X(k ;!)+Y(k ;!) & Z(k ;!)  \tag{36}\\
Z(k ;!) & X(k ;!) Y(k ;!)
\end{array}
$$

and which satis es the D yson equation

$$
\begin{equation*}
\hat{G}^{1}(k ;!)=\hat{G}^{(0)}{ }^{1}(k ;!) \quad{ }^{\wedge}(k ;!): \tag{37}
\end{equation*}
$$

The selfenergy to order $1=(2 S)$ consists of tw o parts

$$
\begin{equation*}
\wedge^{\wedge}(k ;)=\wedge^{(4)}(k)+\wedge^{(3)}(k ;!): \tag{38}
\end{equation*}
$$

$T$ he contribution ${ }^{\wedge}{ }^{(4)}(k)$ is frequency independent and can be calculated sim ply by the $H$ artree Fock decoupling of the quartic term in the H am iltonian Eq. (21).

$$
\begin{align*}
X^{(4)}(k) & =A_{k}+\frac{2 S}{N}^{X} \frac{1}{!_{q}} \quad \frac{1}{2} B_{k}+B_{q} \quad B_{q} \\
& +\left(A_{k} \quad B_{k} \quad A_{q} \quad A_{k}\right) A_{q} ; \tag{39}
\end{align*}
$$

$$
\begin{aligned}
Y^{(4)}(\mathrm{k}) & =B_{k}+\frac{2 S^{X}}{X} \frac{1}{!_{q}}\left(B_{k}+B_{q}\right) A_{q} \\
& +A_{k} \quad B_{k} \quad A_{q} \quad \frac{1}{2} A_{k} \quad B_{q} ;(40)
\end{aligned}
$$

$$
\begin{equation*}
Z^{(4)}(\mathrm{k})=0 \text { : } \tag{41}
\end{equation*}
$$

${ }^{\wedge}{ }^{(3)}(k ;!)$ is the contribution arising from the threem agnon interactions, $\mathrm{H}^{(3)}$. Its non-zero im aginary part determ ines the $m$ agnon dam ping to rst order in $1=(2 S)$. $T$ he corresponding com ponents arem ost easily calculated by transform ing Eq. (19) to the $\mathrm{c}_{\mathrm{k}}$-operator basis using the B ogoliubov transform ations, Eqs. (22]) .

$$
\begin{aligned}
& X^{(3)}(k ;!)=\frac{S}{16 N}_{q}^{X^{n}}[1(q ; k \quad q)]^{2}+[2(q ; k \\
& Z^{(3)}(k ;!)=\frac{S}{16 N}{ }_{q}{ }^{\mathrm{X}}\left[1_{1}(q ; k \quad q)\right]^{2} \quad\left[{ }_{2}(q ; k\right. \\
& \text { q) }]^{0} \frac{1}{!_{q}+!_{k} \quad q \quad!\quad i}+\frac{1}{!_{q}+!_{k} \quad q+\quad i} \quad ;
\end{aligned}
$$

$$
\begin{align*}
& { }_{1}(\mathrm{q} ; \mathrm{k} \quad \mathrm{q})=\left(\mathrm{C}_{\mathrm{q}}+\mathrm{C}_{\mathrm{k}} \mathrm{q}_{\mathrm{q}}\right)\left(\mathrm{u}_{\mathrm{q}}+\mathrm{v}_{\mathrm{q}}\right)\left(\mathrm{u}_{\mathrm{k}} \mathrm{q}_{\mathrm{q}}+\mathrm{v}_{\mathrm{k}} \mathrm{q}_{\mathrm{q}}\right) \quad 2 \mathrm{C}_{\mathrm{k}}\left(\mathrm{u}_{\mathrm{q}} \mathrm{v}_{\mathrm{k}} \underset{\mathrm{q}}{ }+\mathrm{v}_{\mathrm{q}} \mathrm{u}_{\mathrm{k}} \mathrm{q}\right) \text {; } \tag{43}
\end{align*}
$$

## IV . SUBLATTICEMAGNETIZATION

In this section we consider the staggered $m$ agnetization for a range of values of $J^{0}=J$ and $D=J$ and show that quantum uctuations lead to a considerable renorm alization of the average value of the localm om ent. From the operator de nition Eq. (14) we can write the staggered m agnetization as
where the exact $G$ reen's function $G_{11}(k ;!)$ is the corresponding elem ent of the full $m$ atrix $\hat{G}(k ;!)$ and 0 is a negative in nitesim al. To low est order in $1=(2 S)$, one can use $G_{11}^{(0)}(k ;!)$ of Eq. (35), to nd the rst order correction to the $S=1=2$ value

$$
\begin{equation*}
M^{(1)}=\frac{1}{2 N}_{k}^{X} \frac{A_{k}}{n_{k}} 1: \tag{45}
\end{equation*}
$$

For the next order correction in $1=(2 \mathrm{~S})$, there are tw o contributions. The rst one, denoted as $\mathrm{M}_{\mathrm{I}}{ }^{(2)}$, arises from renorm alization by quantum uctuations of the ordering wave vector $Q_{0}$. This correction is obtainable by
substituting the renorm alized value Q given by Eq. (27) into the form ula above and expanding using Eq. (45) up to rst order in $1=(2 S)$.

T he second contribution is determ ined by the selfenergy corrections of order $1=(2 S)$ to the $G$ reen's fiunction itself and is given by

$$
M_{I}^{(2)}=\frac{Q^{(1)}}{2 S} \frac{1}{N}_{k}^{X} \frac{B_{k}\left(A_{k}+B_{k}\right)}{4_{k}^{3}} \frac{Q J_{Q+k}^{T}}{@ Q} Q_{0}:(46)
$$

$$
\begin{equation*}
M_{I I}^{(2)}=\frac{1}{N}_{k}^{X} \frac{\mathrm{~d}!}{2 i}^{\mathrm{Z}}{ }^{i!0} \quad \hat{G}_{11}(\mathrm{k} ;!) ; \tag{47}
\end{equation*}
$$

where

$$
\begin{gather*}
G 11(k ;!)=\hat{G}^{(0)}(k ;!)^{\wedge}(k ;!) \hat{G}^{(0)}(k ;!){ }_{11}=  \tag{48}\\
\left.X(k ;!)+Y(k ;!)] G_{11}^{(0)}(k ;!)^{i_{2}}+2 Z(k ;!) G_{11}^{(0)}(k ;!) G_{12}^{(0)}(k ;!)+X(k ;!) Y(k ;!)\right] G_{12}^{(0)}(k ;!)^{i_{2}}:
\end{gather*}
$$

This correction, as a result of integration over!, w ill contain tw o parts, so that

$$
\begin{equation*}
M \underset{I I}{(2)}=M a_{a}^{(2)}+M b_{b}^{(2)}: \tag{49}
\end{equation*}
$$

O ne part com es from taking the residues at the poles of self-energies, while the other results from the double-poles of the products of tw o G reen's functions. U sing Eqs. (39) -(42), we obtain the rst contribution

$$
\begin{align*}
& M_{a}^{(2)}=\frac{S}{8 N}_{k ; q}^{X} \frac{\left[1_{1}(q ; k \quad q)\right]^{2}}{2} G_{11}^{(0)}(k ; k ; q)+G_{12}^{(0)}(k ; k ; q)^{i_{2}}+\frac{\left[q_{2}(q ; k\right.}{(q)]^{2}} 2 \tag{50}
\end{align*}
$$

$$
\begin{align*}
& { }_{k ; q}=!_{q} \quad!_{k ~}^{q} \text { : } \tag{51}
\end{align*}
$$

$T$ he contribution arising from the residues at the double-poles of the products of two Green's functions in Eqs. (47)-(48), is straightforw ard to calculate as well. A fter som e algebra, we nd that

$$
\begin{aligned}
& \left.\left.\left.M_{b}^{(2)}=\frac{1}{2 S N} \underset{k}{X} \frac{B_{k}}{4{\underset{k}{k}}_{3}^{(2)}} \mathbb{X}\left(k ;!_{k}\right)+Z\left(k ;!_{k}\right)\right]\left[A_{k}+B_{k}\right] \quad X\left(k ;!_{k}\right) \quad Z\left(k ;!_{k}\right)\right] A_{k} \quad B_{k}\right] \\
& \left.+\frac{1}{N}_{k}^{X} \frac{\left(A_{k} "_{k}\right)}{4 \#_{k}^{2}} \quad\left[X^{0}\left(k ;!_{k}\right)+Z^{0}\left(k ;!_{k}\right)\right] \mathbb{A}_{k}+B_{k}\right] \quad\left[X^{0}\left(k ;!_{k}\right) \quad Z^{0}\left(k ;!_{k}\right)\right]\left[\mathbb{A}_{k} \quad B_{k}\right] \quad 2 Y^{0}\left(k ;!_{k}\right) "_{k} \quad ;(52)
\end{aligned}
$$

where $!_{k}=2 S{ }^{k}$, and

$$
\begin{equation*}
X^{0}\left(k ;!_{k}\right) ; Y^{0}\left(k ;!_{k}\right) ; Z^{0}\left(k ;!_{k}\right)=\frac{@ X(k ;!)}{@!} ; \frac{@ Y(k ;!)}{@!} ; \frac{@ Z(k ;!)}{@!} \quad!=!{ }_{k} \tag{53}
\end{equation*}
$$

It is clear from the expressions above that both $M_{I}^{(2)}$ and $\mathrm{M}{ }^{(2)}$ contain the overall prefactor $1=(2 \mathrm{~S})$.

In $F$ ig. 2, we plot the total sublattice $m$ agnetization

$$
\begin{equation*}
M=S+M{ }^{(1)}+M I_{I}^{(2)}+M{ }_{I I}^{(2)} \tag{54}
\end{equation*}
$$

as a function of $D$ zyaloshinskii-M oriya interaction $D$, for coupling constants $J$ and $J^{0}$ as given by Eqs. (2). The
ratios of each correction to the classical $m$ agnetization $S=1=2, \quad M=S$, are also plotted, as explained in the caption of F ig. 2. O ne can see that the renom alization of the localm agnetization by quantum uctuations to second order in $1=(2 S)$ is considerable for all values of $D$ betw een 0 and $0: 025 \mathrm{~m} \mathrm{eV}$, although increasing $D$ clearly suppresses uctuationsm aking the system $m$ ore classical. The gure also show s a calculated sublattice m agnetiza-

F IG . 2: The total value of sublattice $m$ agnetization M, Eq. (54), calculated up to the second order in $1=(2 S)$ as a function of zyalosh insk ii-M oriya interaction $D$, is show $n$ by the solid line. The dashed, dotted and dashed-dotted lines are the results for the quantum corrections $M^{(1)}, M_{I}^{(2)}$ and

M ${ }_{\text {II }}^{(2)}$, respectively, divided by $S=1=2$.
meV , signaling the $m$ elting of the assum ed spiralordered ground state by quantum uctuations when $D$ is too sm all.

Experim entally, a value of $\quad \mathrm{M}=\mathrm{S} \quad 0: 25 \mathrm{w}$ as inferred by Coldea and co-workens ${ }^{31}$ from elastic neutron scattering, and this value was used in the analysis of the m ost recent neutron data ${ }^{14}$ Such a sm all renorm alization of the local $m$ om ent is incom patible $w$ ith the theory presented here. It is also unlikely to be explained by the addition of the very sm all expected interlayer exchange coupling $J^{\infty}=J=0: 045{ }^{14,24}$ It is indeed puzzling that such a sm all m om ent reduction, which is less than for the spin $1=2 \mathrm{H}$ eisenberg antiferrom agnet on a twodim ensional square lattice, would occur in this system which is both frustrated and close to the one-dim ensional lim it.

## V. ENERGY SPECTRUM

The renorm alized m agnon energy spectrum $\iota_{k}=2 S \mu_{k}$ can be found from the poles of the exact $G$ reen's function, determ ined by ${ }^{29}$
tion that is negative for $D$ between 0 and $D \quad 0: 003$

$$
\begin{equation*}
R e^{n} \operatorname{det} \hat{G}^{1}\left(k ; t_{k}\right)=R e^{n} \operatorname{det} \hat{G}^{(0)}{ }^{1}\left(k ; t_{k}\right) \quad \wedge_{\left(k ; \iota_{k}\right)}^{\text {io }}=0 \tag{55}
\end{equation*}
$$

which leads to the self-consistency equation:

$$
\begin{align*}
& \left.\left.!_{k}=\quad f f 2 S\left(A_{k}+B_{k}\right)+\operatorname{ReX}\left(k ; t_{k}\right) \quad Z\left(k ; t_{k}\right)\right] g f 2 S\left(A_{k} \quad B_{k}\right)+\operatorname{ReX}\left(k ; t_{k}\right)+Z\left(k ; t_{k}\right)\right] g \\
& \left.\left.\operatorname{fIm} \mathbb{X}\left(k ; \iota_{k}\right)+Z\left(k ; \iota_{k}\right)\right] g \mathrm{Im} \mathbb{X}\left(k ; \iota_{k}\right) \quad Z\left(k ; \iota_{k}\right)\right] g+\left[\operatorname{Im} Y\left(k ; \iota_{k}\right)\right]^{O^{1=2}}+\operatorname{ReY}\left(k ; \iota_{k}\right): \tag{56}
\end{align*}
$$

$N$ ear these poles, if the im aginary part of the selfenergy is sm all, the shape of the one-m agnon spectrum is approxi$m$ ately Lorentzian and has the form ${ }^{29}$

$$
\begin{equation*}
\operatorname{det} \hat{G}^{1}(\mathrm{k} ;!)^{\prime} \quad 2!{ }_{k} z_{k}\left(!\quad!_{k}\right)+\dot{\operatorname{IIm}} \mathrm{h} \operatorname{det} \hat{G}^{1}\left(\mathrm{k} ; \ell_{\mathrm{k}}\right)^{i} \text {; } \tag{57}
\end{equation*}
$$

where

$$
\begin{equation*}
2!_{k} z_{k}=\frac{@}{@!} \operatorname{Re}^{h} \operatorname{det}^{1} \hat{G}^{1}(k ;!)^{i}: \tag{58}
\end{equation*}
$$

The im aginary part of Eq. (57) determ ines the inverse life-tim e of the quasiparticles. To calculate the half-w idth at half.m axim um of the peak, we use the param eter

$$
\begin{equation*}
k_{k}, \frac{\operatorname{Im}\left[\operatorname{det} \hat{G}^{1}\left(k ; t_{k}\right)\right]}{2!_{k} z_{k}}: \tag{59}
\end{equation*}
$$

Equation (56), although form ally exact, im plicitly includes contributions of all orders in $1=S$. Furthem ore,
quantities such as the term s $2 \mathrm{~S}\left(\mathrm{~A}_{\mathrm{k}} \quad \mathrm{B}_{\mathrm{k}}\right)$ that are of the leading order in $S$, should be corrected for the rst order shift of the ordering wave vector from $Q_{0}$ to $Q$, given by Eqs. (27)-(28). A though the self-energies are only calculated to order $1=S$, taking the square root of a sum of squares of self-energies evaluated at renorm alized frequencies, e ectively $m$ ixes in higher order corrections. A lso, particularly for the case $D=0$, there is cancellation am ong term s of order $1=S$, leaving a result, at the shifted $Q$-vector, which is the square root of residuall $=S^{2}$ term $S$, which $m$ ay be negative.

A simple way to preserve physical behavior at the $G$ oldstone wave vector $Q$ for $D=0$, is to evaluate the
self-energies using renorm alized coupling constants, for which the classical ordering w ave vector is $Q$, that is

$$
\begin{equation*}
Q=+2 \arcsin \frac{J^{0}}{2 J}: \tag{60}
\end{equation*}
$$

$T$ he e ect of this renorm alization, which determ ines the ratio $J^{0}=J$ and represents a higher order in $1=S$ correction to the self-energies, is that the self-energies will vanish at the renorm alized $Q$. A further renorm alization of $J$ by itself is de ned by the condition that the coe cient of the linear term in $j k \quad Q$ inside the square root vanishes for $k=Q$, so that the energy dispersion relation around this point is linear in $\mathrm{j} \quad \mathrm{Q} j$. The procedure ofexpanding the self-energies around $Q$ is tedious but com pletely equivalent to that described elsew here. ${ }^{29,30}$ O m itting the interm ediate steps, we obtain the condition

$$
\begin{equation*}
{\frac{@ J_{k}}{@ k}}_{k=Q}=\frac{1}{2 S N}_{p}^{X} \frac{\left(A_{p}+B_{p}\right)}{"_{p}} \frac{@ J_{p+Q}}{@ p} ; \tag{61}
\end{equation*}
$$

where the bars indicate that the renorm alized values $J$ and $J^{0}$ should be used in the right hand side of th is equation. O ne can easily check that, w thin this approach, we retain consistency up to low est order in $1=2 \mathrm{~S}$. Indeed, expanding the derivative $@ J_{k}=@ k$ around $Q_{0}$, we recover Eq. (28) for the correction to the ordering $w$ ave vector. U sing Eqs. (2), we nd from Eqs. (60)-(61) that

$$
\begin{equation*}
\text { J } \quad 0: 472 \mathrm{meV} ; \quad \mathrm{J}^{0} \quad 0: 066 \mathrm{~m} \mathrm{eV} \text { : } \tag{62}
\end{equation*}
$$

W e see that in this approach, $J^{0}$ is renorm alized down from its bare value, while $J$ increases, as discussed in Sec. II.

In spite of the fact that we expect the system to be unstable for $D=0$ and $J^{0}=J=1=3$, it is of pedagogical interest to exam ine the e ects of anharm onicity and the shift of the $G$ oldstone $m$ ode for this case. T he right hand panel of F ig. 3 show s the results for the renorm alized energy spectrum and its com parison to the linear spinwave dispersion along the $(1 ; 0)$ direction for $D=0$. The inverse lifetim e of quasiparticles Eq. (59) is also shown. The excitations are seen to be heavily overdam ped close to the (10) point. A lso kinks are seen at various places in the renorm alized curves, apparently at points w here one-to-two magnon decay channels tum on. A though not shown in Fig. [3, we also nd that the band width of the dispersion along $(1 ; 0)!(1 ; 1)$ is renom alized dow nw ard by about a factor of 3 due to anharm onic e ects.

In the left hand panel of F ig. 3 , we plot the renorm alized energy spectrum for $\mathrm{D}=0: 02 \mathrm{meV} \overbrace{}^{23}$ In the presence of this DM interaction, it su ces to use the bare values for the coupling constants in expressions for self-energies, since the nite gap in the spectrum does not lead to any problem atic behavior near $Q$ when $D$ is not too sm all. The e ects of quantum uctuations are very sensitive to the presence of a non-zero D. Increasing the value of $D$ reduces the interaction-induced dam ping of quasiparticles, $m$ aking them $m$ ore stable. $Q$ uantum

F IG. 3: (C olor Online) The two panels present the results for the bare and renorm alized energy spectra for the cases of $D=0$ and $D=0: 02 \mathrm{meV}$. Spin-w ave energies are show $n$ together w ith the inverse lifetim e $k$. The path in the twodim ensionalB rillouin zone sw eeps from (OO) point to (10). $\mathrm{k}_{\mathrm{x}}$, $k_{y}$ are $m$ easured in units of 2 and $2=\overline{3}$ respectively.
uctuations, in addition to shifting $Q$ tow ards, reduce the size of the gap at this point. H ow ever, the e ect of suppression of the gap tow ards zero, is relatively sm all for $D=0: 02 \mathrm{meV}$.

## VI. SCATTERING INTENSITY

In this Section, the dynam ical properties of an antiferrom agnet described by the model of Eq. (1) are calculated within the fram ew ork of the $1=(2 \mathrm{~S})$ expansion. W e are speci cally interested in answ ering the question of whether anharm onic spin waves can account for the m ain features seen in inelastic neutron scattering m easurem ents on $\mathrm{Cs}_{2} \mathrm{CuC}_{4}{ }^{14} \mathrm{~W}$ e begin w th expressions for the structure factor com ponents that enter the form ula for the inelastic neutron scattering cross section. These results were obtained earlier by O hyam a and Shiba, ${ }^{29}$ and we sim ply quote them here.

N eutron scattering spectra of spin excitations in m agnetic solids may be expressed in term s of the Fourier transform ed real-tim e dynam ical correlation function, $i ; k=(x ; y ; z)$

$$
\left.S^{i k}(k ;!)=\frac{1}{2} \int_{1}^{Z} d t{ }_{R}^{X} S_{0}^{i}(0) S_{R}^{k}(t) i e^{i(!t} k \quad R\right):(63)
$$

For the spiral spin density wave state, $S^{x x}(k ;!)=$ $S^{z z}(k ;!)$. The com plete expression for the inelastic, differential scattering cross-section, including polarization factors, is given by ${ }^{27}$

$$
\begin{align*}
& I(k ;!)=p_{x} S^{x x}(k ;!)+p_{y} S^{y y}(k ;!) ;  \tag{64}\\
& p_{x}=1+\cos ^{2} k ; \quad p_{y}=\sin ^{2} k ; \tag{65}
\end{align*}
$$

where $k$ is the angle betw een the scattering w ave vector $k$ and the axis perpendicular to the plane of the spins.

We begin by calculating the corresponding tim eordered spin-spin correlation functions in the rotated $\mathrm{co}^{-}$ ordinate system

$$
\text { iF }(k ;!)=\sum_{1}^{Z_{1}} \text { dte }{ }^{i!t h \hat{X} S_{k}(0) S_{k}(t) i ; ~}
$$

$$
\begin{align*}
& S^{\mathrm{Yy}}(\mathrm{k} ;!)=\frac{1}{\operatorname{Im} \mathrm{~F} \quad(\mathrm{k} ;!) ;}  \tag{67}\\
& S^{\mathrm{xx}}(\mathrm{k} ;!)=\mathrm{S}^{\mathrm{zz}}(\mathrm{k} ;!)=\frac{1}{-} \mathrm{Im} \quad+(\mathrm{k}+\mathrm{Q} ;!)+\quad(\mathrm{k} \quad Q ;!) ;  \tag{68}\\
& S^{\mathrm{xz}}(\mathrm{k} ;!)=S^{\mathrm{zx}}(\mathrm{k} ;!)=\frac{\text { i }}{-} \mathrm{Im}+(\mathrm{k}+Q ;!) \quad(\mathrm{k} \quad Q ;!) ; \tag{69}
\end{align*}
$$

w ith,

$$
\begin{equation*}
(k ;!)=\frac{1}{4} F \quad(k ;!)+F \quad(k ;!) \quad i F \quad(k ;!) \quad F \quad(k ;!) \quad: \tag{70}
\end{equation*}
$$

$W$ e treat the interactions betw een the $m$ agnons as a perturbation in the form ally $s m$ all param eter $1=(2 S)$, and use the standard $\hat{S}-m$ atrix expansion while calculating the averages of the $m$ agnon operators $a_{k}(t) .28$ A s a result,

$$
\begin{align*}
& F \quad(k ;!)=\frac{S}{2} C_{y}^{2}\left[G_{11}(k ;!)+G_{22}(k ;!) \quad 2 G_{12}(k ;!)\right] ; \\
& F \quad(k ;!)=\frac{S}{2} C_{x}^{2}\left[G_{11}(k ;!)+G_{22}(k ;!)+2 G_{12}(k ;!)\right] \tag{71}
\end{align*}
$$

where the G reen's function are determ ined from Eq. 37) w ith the selfenergies given by Eqs. (39)-(42), and, to the relevant order in $1=(2 S)$,

$$
\begin{align*}
& C_{y}=1 \frac{1}{4 S N}_{k}^{X} 2 v_{k}^{2} \quad u_{k} v_{k} ; \\
& c_{\mathrm{x}}=1 \frac{1}{4 S N}_{\mathrm{x}}^{\mathrm{X}} 2 \mathrm{v}_{\mathrm{k}}^{2}+\mathrm{u}_{\mathrm{k}} \mathrm{v}_{\mathrm{k}}: \tag{72}
\end{align*}
$$

$T$ he term that $m$ ixes the transverse and longitudinal uctuations has the form :

$$
\begin{align*}
& \text { i } F \quad(k ;!) \quad F \quad(k ;!)=C_{x} P^{(1)}(k ;!)\left[G_{11}(k ;!)+G_{22}(k ;!) \quad 2 G_{12}(k ;!)\right] \\
&+P^{(2)}(k ;!)\left[G_{11}(k ;!) \quad G_{22}(k ;!)\right]: \tag{73}
\end{align*}
$$

w ith the functions $P^{(1 ; 2)}(k ;!)$ de ned as

$$
\begin{align*}
& P^{(1)}(k ;!)=\frac{S}{4 N}_{q}^{X} \\
& { }^{(1)}(q ; k \\
& \text { q) }\left(u_{q} v_{k} q_{q}+v_{q} u_{k} q\right) \frac{1}{!_{q}+!_{k} q \quad!\quad i}+\frac{1}{!_{q}+!_{k} q+!\quad i} \text {; } \\
& P^{(2)}(k ;!)=\frac{S}{4 N}_{q}^{X}  \tag{74}\\
& \text { (2) }(q ; k
\end{align*}
$$

A s before, $!_{k}=2 S "_{k}$. The longitudinal correlations expanded in inverse powers of 2 S can be expressed as a sum of tw o contributions

$$
\begin{equation*}
F \quad(k ;!)=F_{0}(k ;!)+F_{1}(k ;!) ; \tag{75}
\end{equation*}
$$

where

$$
\begin{equation*}
F_{0}(k ;!)=\frac{1}{2 N}_{q}^{X}\left(u_{q} v_{k} q_{q}+v_{q} u_{k} q\right)^{2} \frac{1}{!_{q}+!_{k} q_{q}!\quad i}+\frac{1}{!_{q}+!_{k}+!} i \tag{76}
\end{equation*}
$$

$$
\begin{align*}
F_{1}(k ;!)= & \frac{1}{2 S} P^{(1)}(k ;!)^{2}\left[G_{11}(k ;!)+G_{22}(k ;!)+2 G_{12}(k ;!)\right]+P^{(2)}(k ;!)^{2} \\
& {\left[G_{11}(k ;!)+G_{22}(k ;!) \quad 2 G_{12}(k ;!)\right]+2 P^{(1)}(k ;!) P^{(2)}(k ;!)\left[G_{11}(k ;!) \quad G_{22}(k ;!)\right]: } \tag{77}
\end{align*}
$$

$N$ ote that the term $F_{1}(k ;!)$ is form ally oforder $1=(2 S)^{2}$ com pared to the leading one $m$ agnon contributions Eq. (71) . H ow ever, it is kept because it contains the selfenergy corrections to Eq. 76) describing the tw om agnon continuum .

U sing the set of form ulas above, we have calculated the scattering intensities as a function of frequency for various trajectories in $k$ and ! space, corresponding to the $m$ easured spectra ${ }^{14}$ In generalour results agree $w$ ith those of Veillette et al ${ }^{23}$ except for $s m$ all di erences due to their use of self-consistent energy denom inators in the self-energies and our use ofshifted $Q$ values in the anharm onic G reen's functions. Veillette et al. restricted their attention to values of $J, J^{0}$ and $D$ given by Eqs. (2)-(3). In the discussion that follow s , we w ill also consider the consequences of varying the $D$ param eter, which both shifts certain $m$ odes and also controls the size of quantum uctuations, as well as varying the overall energy scale, J .
$W$ e focus our attention on tw o tra jectories in the ( $k$; !) space w hose param eterizations correspond to the scans G and J of Ref. 14 ,

$$
\begin{array}{lll}
G: & k_{x}=0: 5 ; & k_{y}=1: 53 \\
J: & 0: 32! & 0: 1!^{2}  \tag{78}\\
\mathrm{~J}=0: 47 ; k_{\mathrm{y}}=1: 0 & 0: 45!:
\end{array}
$$

In $\mathrm{E}_{\mathrm{p}}$. 78), $\mathrm{k}_{\mathrm{x}}$ and $\mathrm{k}_{\mathrm{y}}$ are written in the units of 2 and $2=\overline{3}$ respectively, while the energy ism easured in meV . Since the m om entum transfer lies in the $\mathrm{x}-\mathrm{z}$ plane, $\mathrm{p}_{\mathrm{x}}=$ $p_{y}=1$ forboth ofthose scans. It is im portant also to take into account the nite energy and $m$ om entum resolution of the scattered neutrons. The nite energy resolution
! $0: 016 \mathrm{~m} \mathrm{eV}$ leads to a sm all Lorentzian broadening ofthe onem agnon peaks. H ow ever, the ect ofsm earing due to the nite m om entum resolution $\mathrm{k}=2=0: 085$ is $m$ uch $m$ ore pronounced and considerably broadens the structure of the G and J scans. W hat is special about the $G$ and $J$ scans is that they both exhibit shanp low energy m odes w ith energies around 0.1 m eV . A s we shall see, the energies of these peaks are quite sensitive to the exact value of the DM interaction D.

In Fig. 4, we plot the results of scattering intensity calculations for scan G, a data set which was analyzed in detail by Coldea et al ${ }^{14}$ In particular, it was claim ed that the high-energy tail in this scan has too $m$ uch intensity, by nearly an order ofm agnitude, to be explained by linear spin-w ave theory. O ur calculations w ere done using the bare couplings $J$ and $J^{0}$, and the D zyaloshinskii$M$ oriya interaction was set equal to $D=0: 02 \mathrm{meV}$, the value obtained from experim ents in high $m$ agnetic eld ${ }^{24}$ The theory predicts three peaks, one corresponding to the principalm ode ${ }^{k}$ and the other two, re ecting the

FIG.4: (C olor Online) Intensity of the scattered neutrons for scan $G$ in Eq. 78), in the presence of D zyalosh inskiiM oria interaction $\mathrm{D}=0: 02 \mathrm{meV}$. The energy and m om entum resolutions are taken to be $!=0: 016 \mathrm{~m} \mathrm{eV}$ and $\mathrm{k}=0: 085$ respectively. T he thick solid line is the total scattering intensity, Eq. 64). O ther lines represent the various contributions appearing in Eqs. 67-71.
presence of the shifted secondary spin waves at " ${ }_{Q}$. For the non-renorm alized couplings $J$ and $J^{0}$, Eq. (24) for the bare spectrum predicts that the principal peak should be at $0: 22 \mathrm{meV}$ while the secondary peaks are very close to each other and located approxim ately at energy $0: 28 \mathrm{~m} \mathrm{eV}$. Inclusion of selfenergies to order $1=(2 \mathrm{~S})$ renorm alizes the position of the $m$ ain peak down to $0: 18$ meV . The principal one-m agnon peak should lie below a two-m agnon scattering continuum starting exactly at the location of the principal peak. H ow ever, the presence of selfenergies in the $G$ reen's functions, leads to a shift in positions of their poles, and to a nite gap betw een the principal peak and the start of the two $m$ agnon scattering continuum. This result is an artifact of truncating the pertunbation expansion at a nite order, as discussed by Veillette et $a l^{23} \mathrm{~W}$ e also observe that the tw o secondary peaks are so close to each other that it is di cult to distinguish them, once the nite frequency and $m$ om entum resolution is filly incorporated into the calculations. Experim entally, the $m$ ain peak is observed at a som ew hat sm aller energy of $0: 107 \mathrm{meV}$, while the secondary ones are located around $0.25 \mathrm{~m} \mathrm{eV}{ }^{14} \mathrm{~F}$ ig. (4) also show sthe sign and $m$ agnitude of the various contributions to the total intensity. It is seen that the two-m agnon part, integrated over the full range of frequencies, carries a considerable

FIG. 5: (C olor Online) Intensity of the scattered neutrons corresponding to scan $G$, for the value ofD zyaloshinskii-M oria interaction $D=0: 01 \mathrm{~m} \mathrm{eV}$. U pper panel: $T$ he total structure factor $w$ ith the energy ( m om entum) resolution $\mathrm{E}=0: 016$ $m \mathrm{eV}$ ( $\mathrm{k}=0: 085$ ). Inset: Experim ental data from $\mathrm{Ref} 14.$. Lower panel: D i erent com ponents which contribute to the structure factor (see E qs. 67) -71) in the text).
overallw eight com pared to the one-m agnon contribution. At the same time, the term $m$ ixing the transverse and longitudinal uctuations can have both signs, and being sm all, does not in uence the intensity pro le very m uch.

W hy is the two-m agnon intensity in our calculation so much larger, relative to the principal peak than in the analysis of $C$ oldea et al? The reason is the factor $c_{y}^{2}$ which renorm alizes the out-of-plane scattering and which is basically due to the reduction of the localm om ent by quantum uctuations. A s noted above, theory predicts a m uch sm aller localm om ent than the sunprisingly large value obtained from experim ent. ${ }^{31}$ A ccording to our calculations, the $m$ om ent reduction increases $w$ ith decreasing $D$, and the ordered $m$ om ent vanishes for $D<0: 003$ meV .

In $F$ ig. [5, we plot the theoretical result for scan $G$, but this tim ew ith a reduced DM interaction $D=0: 01 \mathrm{meV}$.

FIG. 6: (C olor Online) Intensity of the scattered neutrons corresponding to scan J, Eq. 78), in the presence of D zyaloshinskii-M oria interaction $D=0: 02 \mathrm{~m} \mathrm{eV}$. The di erent com ponents are displayed as in F igs.4,5

T he com parison of our calculations $w$ th the experim entalm easurem ents reported in Ref. 14, is displayed in the upper panel. W e see that for this value ofD, the position of the principalm agnon peak is shifted tow ards sm aller energies. The gap betw een the $m$ ain peak and the energy where the continuum appears, is also decreased; there is further broadening of the principalpeak and $m$ ore intensity in the two-m agnon continuum. It appears that the value $D=0: 01 \mathrm{meV}$ provides a better explanation of the form of the total scattering intensity for scan $G$ than $D=0: 02 \mathrm{meV} . \mathrm{Com}$ parison of the plots for a range of values of $D$, shows that the scattering intensity is very sensitive to the strength of the DM interaction. $\mathbb{N}$ ote that the DM interaction was not included in the analysis of $R$ ef. 14.] Finally, we observe that even this sm aller value of $D=0: 01 \mathrm{meV}$ does not account for all of the high energy scattering which seem $s$ to extend up to 1 meV , suggesting additional correlations at high energy which are not contained in the theory.

Next, we exam ine scan $J$ which probes the vicinity of the ordering wave vector ${ }^{14}$ Inelastic scattering at this point should show a prim ary peak at the wave vector $\mathrm{k}_{\mathrm{J}} \quad \mathrm{Q}$ and two secondary m odes, corresponding to mo $m$ entum transfer $k_{J} \quad Q$. The prim ary mode, which is prom inent in the theoreticalspectrum, directly $m$ easures the strength of the DM interaction, since its energy is proportional to $\overline{\mathrm{DJ}}$. The experim ental data for point $J$, shown only in the inset of $F$ ig. 5 G in the paper of Coldea and co-w orkers, ${ }^{14}$ do not extend to low enough energy to display this peak. $N$ evertheless the position of the peak, at an energy of $0.10(1) \mathrm{meV}$, is listed in Table 1 of that paper. This value of the mode at the $J$ point is noticeably sm aller than anharm onic spin-wave theory would predict for $D=0: 02 \mathrm{meV}$, suggesting that
the e ective value of the DM interaction constant $D$ is sm aller than 0.02 meV . Since the theory, for $\mathrm{D}=0: 02$ meV , gives a peak at 0.15 meV , a t to the m easured peak at 0.1 m eV would suggest a value ofD in the range of 0.008 to 0.01 m eV . O f the tw o secondary peaks at the J point, one has an energy close to zero, corresponding to the shifted zone-center $m$ ode, while the other lies at higher energy, just above 0.3 meV .

## VII. D ISCUSSION AND CONCLUSIONS

The $m$ ain $m$ otivation for the work presented in this paper was to see if a relatively conventional anharm onic spin-w ave calculation could account for neutron scattering $m$ easurem ents on $\mathrm{Cs}_{2} \mathrm{CuCl}_{4}$. Our conclusion is a quali ed \yes".

W thout any calculations, one know s that the observed excitations are from an ordered state exhibiting $m$ agnetic B ragg peaks, and hence that the low est-lying excitations m ust be spin waves. H ow ever, both linear and anhar$m$ onic spin-w ave theory suggest a substantial $m$ om ent reduction for a broad range around the expected values of $D=J$ and $J^{0}=J$. Further experim ents would be useful to verify the am ount by which the m om ent is reduced, since the present result ${ }^{31}$ is inconsistent both $w$ th anharm onic spin-w aves and w ith close proxim ity to a spinliquid state.

At low energies we nd that we can $t$ the sharp spinw ave features of the data, albeit w ith a som ew hat sm aller value of the DM interaction constant, $D$, than was obtained from high eld $m$ easurem ents of a fully polarized state. W e also nd from theoretical calculations that, w ithout a su ciently large DM interaction, long range order is destroyed by quantum uctuations. H ow ever, the value ofD that best ts theory to experim ent is well w ithin the range in which order is stable, at least for $T=0$. Additional experim ents, including $m$ easurem ents of the renorm alized $D$ in zero eld, $m$ ight clarify this point. (W e note in passing that a value of $J$ about 30$40 \%$ larger than given by Eq. (2), for xed $J^{0}=J$, would provide a much im proved $t$ to the higher energy one-spin-w ave features.)

O ur theory yields a considerable am ount of continuous two-spin-w ave scattering. H ow ever the am ount of this scattering, although readily $m$ easurable, is som ew hat less than is observed experim entally. Furtherm ore, calculation of the relative size of one- and two-spin w wave features is com plicated by their sensitivity to the size ofD. $T$ hat is, a sm aller D suppresses one-spin-w ave scattering and $m$ akes tw o-spin-w ave continuous scattering relatively m ore conspicuous. Q uantum uctuations also broaden the one-spin-w ave features via lifetim e e ects. H ow ever, it is di cult to assess, from the data alone, how much of the observed broadening of the principal peaks is due to lifetim es and how $m$ uch is due to low $m$ om entum resolution as was em phasized by Veillette et al ${ }^{23}$ The theory suggests though that experim ents $w$ ith higher $m$ om en-
tum resolution are likely to reveal considerably shanper low energy spin-w ave peaks.
$W$ th regard to the shape of the broad scattering at higher energies, we are inclined tow ard a picture of scattering by quasi-one-dim ensional spinons. W ith a bare interchain coupling of 0.128 meV , which we know to be considerably renorm alized dow nw ard by quantum uctuations, one $m$ ight expect that, at energies above about 0.3 meV , the system would behave like a collection of uncoupled chains. In this sense we would expect the highenergy response of the system to be better described by one-dim ensional spinons than by a low-order spin-w ave perturbation calculation such as the one that we have studied.

## APPENDIX A: $1=(2 S)^{2}$ CORRECTION TO THE GROUND STATE ENERGY AND ORDERING W AVEVECTOR

The ground state energy correction at the order $1=(2 S)^{2}$, denoted here as $\mathrm{E}_{\mathrm{G}}^{(2)}(\mathrm{Q})$, consists of tw o parts,

$$
\begin{equation*}
E_{G}^{(2)}(Q)=E_{3}(Q)+E_{4}(Q): \tag{A1}
\end{equation*}
$$

$\mathrm{E}_{4}(\mathrm{Q})$ is obtained sim ply by substituting the Bogoliubov transform ation Eq. (22) into $H^{(4)}$ and perform ing the nom al ordering in the term $s$ containing two pairs of quasiparticle operators $c$ and $c^{y}$. In this Appendix, we present the results of calculations in which the $D$ zyaloshinskii-M oria interaction $D=0$, so that

$$
\begin{aligned}
& {\frac{1}{N^{2}}}_{k ; p}^{X}\left(A_{k} p \quad B_{k} p\right) \frac{A_{k} A_{p}+B_{k} B_{p}}{4 "_{k} "_{p}}:(A 2)
\end{aligned}
$$

$E_{3}(Q)$ ensues due to the key role of the cubic interactions 19) in the total H am iltonian. It is technically advantageous rst to express (19) in term s of the quasiparticle c-operators, so that

$$
\begin{aligned}
& H^{(3)}=\frac{i}{2}_{\frac{\mathrm{r}}{\bar{S}_{2}^{2 N}}}^{1 ; 2 ; 3} \quad \frac{1}{3}{ }_{1}(1 ; 2 ; 3) \quad C_{3} C_{2} C_{1} \quad C_{1}^{y} C_{2}^{y} C_{3}^{y} \\
& +2(1 ; 2 ; 3) \quad C_{3}^{y} C_{2} C_{1} \quad C_{1}^{y} C_{2}^{y} C_{3} \quad ; \quad \text { (A 3) }
\end{aligned}
$$

$$
\begin{aligned}
1(1 ; 2 ; 3) & =\left(C_{1}+C_{2}\right)\left(u_{1} u_{2} v_{3}+v_{1} v_{2} u_{3}\right) \\
& +\left(C_{1}+C_{3}\right)\left(u_{1} u_{3} v_{2}+v_{1} v_{3} u_{2}\right) \\
& +\left(C_{2}+C_{3}\right)\left(u_{2} u_{3} v_{1}+v_{2} v_{3} u_{1}\right) ;(A 4)
\end{aligned}
$$

At $T=0$, the only contribution to $\mathrm{E}_{3}(\mathrm{Q})$ is given by the

$$
2(1 ; 2 ; 3)=\left(C_{1}+C_{2}\right)\left(u_{1} u_{2} u_{3}+v_{1} v_{2} v_{3}\right)
$$ 'sunrise' diagram containing two vertioes 1 (qip; q

$$
+\left(\begin{array}{ll}
C_{1} & C_{3}
\end{array}\right)\left(v_{1} u_{2} u_{3}+u_{1} v_{2} v_{3}\right)
$$ p). U sing the form ulas (23), we arrive at the follow ing expression for $E_{3}$ :

N um erical calculations show that for the interaction constants given by Eqs. (2),

$$
+2 \frac{\varrho^{2} E_{G}^{(1)}(Q)}{\varrho Q^{2}}\left(Q^{(1)}\right)+4 \frac{@ E_{G}^{(2)}(Q)^{\#}}{\varrho Q} \quad(\underset{Q}{Q} 11)
$$

$$
\begin{align*}
& E_{3}\left(Q_{0}\right)=J=0: 0425 ; \\
& E_{4}\left(Q_{0}\right)=J=0: 0103 ; \tag{A8}
\end{align*}
$$

which are quite sm all. The $1=(2 S)^{2}$ correction to $Q_{0}$ can be com puted by substituting the expansion

$$
\begin{equation*}
Q=Q_{0}+\frac{Q^{(1)}}{2 S}+\frac{Q^{(2)}}{(2 S)^{2}} \tag{A9}
\end{equation*}
$$

into the series for the ground state energy

$$
E_{G}(Q)=S^{2} J_{Q}+S_{G}^{(1)}(Q)+E_{G}^{(2)}(Q) ; \quad \text { (A10) }
$$

The calculations of derivatives over $Q$ in expressions entering Eqs. (26), (A6), A2) are lengthy but straightforward. Om 壮ing the corresponding cum bersome nal expressions, we state here that as a result of num erical integration:
and expanding its m inim um in powers of $1=(2 \mathrm{~S})$. A s a result,

$$
Q^{(2)}=\frac{\varrho^{2} J_{Q}}{@ Q^{2}}{ }^{1} \frac{1}{2} \frac{\varrho^{3} J_{Q}}{@ Q^{3}}\left(Q^{(1)}\right)^{2}
$$

The value of the ground state energy at its $m$ inim um ( $\mathrm{S}=1=2$ )

$$
\begin{equation*}
E_{m \text { in }}=J=\frac{1}{J} S^{2} J_{Q}+S E_{G}^{(1)}(Q)+E_{G}^{(2)}(Q) \quad \frac{1}{8} \frac{Q^{2} J_{Q}}{@ Q^{2}} \quad\left(Q^{(1)}\right)^{2} Q_{0}=0: 459: \tag{A13}
\end{equation*}
$$

$N$ ote that the last term in Eq. A13) is alw ays negative and arises solely due to the shift in the ordering wave vector Q ${ }^{(1)}$. N um erically how ever, this term is tiny, even com pared to the second order correction $E_{G}^{(2)}\left(Q_{0}\right)$ that itself gives a sm all contrbution to the total energy Eq. A 13).
