In a recent e-print (cond-mat/0609768, \Dipole transitions and Stark effect in the charge-dyon system ", by L.M. Ardoyan, A. Nersessian, H. Sarkisyan, V. Yeghikyan, [1]) the authors claim that "the presence of monopole, besides providing the system with degenerated (on azimuth quantum number) ground state, makes possible the dipole transitions which obey selection rules ($l^0 = l; m^0 = m; m^0 = m - 1$), where $l; m$ are respectively, orbital and azimuth quantum numbers". Also they calculated the linear and quadratic Stark effect in such a system and pointed out that "the linear Stark effect in the ground state is proportional to azimuth quantum number, and to the sign of monopole number" and "the quadratic Stark effect in the ground state is independent on the signs of azimuth and monopole numbers".

It is well known [4, 5] that modification of the selection rules in a theory with monopole arises as a straightforward consequence of the non-invariance of model under spatial reflection (P) which is a by-product of consistent consideration of magnetic monopoles, both Abelian and non-Abelian [2, 3, 9].

It was also demonstrated on a simple model example of a bound non-relativistic system electron-dyon, which is described by Schrodinger or Pauli Hamiltonian, that the selection rules for a dipole radiation, unlike the familiar quantum-mechanical situation, admit the transitions with $l = 0$ [5]. It was pointed out that in the consistent relativistic theory based on Dirac equation the same modification is taking place as well [10, 11, 15, 16].

Consideration of properties of the bound system charge-monopole or charge-dyon in external fields also allows to observe the above mentioned effects, which are related with P -parity violation. In particular, Stark and Zeeman effects, as well as photoionization of the ground state of the bound system charge-dyon was analyzed in [6, 7, 8]. Since the modification of the selection rules for a dipole radiation arises from angular part of the Hamiltonian and is related with matrix element sandwiched between generalized angular harmonics, inclusion of additional radial-dependent interaction terms, does not affect this result. In particular, the spectrum of Pauli and Dirac Hamiltonian of such a system with usual Coulomb electromagnetic potential and corresponding matrix elements of the dipole moment operator were considered by [12, 13, 14].

The inclusion of the extra radial dependent term $s^2 = 2r^2$ into the non-relativistic Hamiltonian of the charge-dyon system does not make any principal difference comparing to the previous consideration. At least, the authors have to refer the related works properly.
