# $E$ ects of CP-V iolation in N eutralino Scattering and A nnihilation 

Paolo G ondolo ${ }^{\text {a }}$ and $K$ atherine Freese ${ }^{\text {a;b }}$<br>${ }^{\mathrm{a}} \mathrm{M}$ ax-P lanck-Institut fur $P$ hysik, Fohringer $R$ ing $6,80805 \mathrm{M}$ unchen, $G$ erm any (gondolo@ m ppm u m pg.de)<br>${ }^{\mathrm{b}}$ P hysics D epartm ent, U niversity of M ichigan, A nn A roor, M I 48109, U SA (ktfreese@ um ich .edu)

$W$ e show that in som e regions of supersym $m$ etric param eter space, $C P$ violatinge ects that $m$ ix the CP-even and CP-odd H iggs bosons can enhance the neutralino annihilation rate, and hence the indirect detection rate ofneutralino dark m atter, by factors of $10^{6}$. The sam e CP violating e ects can reduce the neutralino scattering rate - nucleons, and hence the direct detection rate of neutralino dark m atter, by factors of $10{ }^{7}$. $W$ e study the dependence of these e ects on the phase of the trilinear coupling $A$, and nd cases in the region being probed by dark $m$ atter searches which are experim entally excluded when CP is conserved but are allowed when CP is violated.

The neutralino elastic scattering cross section (in pb ) is plotted in g .1 as a function of neutralino $m$ ass (in GeV ) for $10^{6}$ values in SU SY param eter space. T he upper panel is for the case of CP violation via $\operatorname{Im}(A) \quad 0$ while the lower panel is for the case of no CP violation. In the upper panel, it is the $m$ axim ally enhanced cross section (as a function of arg (A)) that is plotted. $T$ he dark points refer to those values ofparam eter space which have the $m$ axim um value of the cross section for nonzero Im (A) and which are experi$m$ entally excluded at zero Im (A). The grey region refer to those values of param eter space which are enhanced when CP violation is inchuded and which are allowed also at zero Im (A). T he light grey em pty squares refer to those values of param eter space which have no enhancem ent when CP violation is included. The solid lines indicate the current experim ental bounds placed by DAMA and CDMS; the dashed lines indicate the future reach of the CDMS (Soudan), GENIUS,

and CRESST proposals.
In g. 2 we show the enhancem ent and suppression factors of the elastic scattering cross section for the case of $C$ P violating $\arg (A)$. The plot show sthe ratios $R_{m a x}={ }^{m a x}=m a x[(0) ;()]>$ 1 and $R_{m}$ in $={ }^{m \text { in }}=m$ in $[(0)$; ( ) ] as a function ofthe values A ofthe phase ofA where them axi$\mathrm{mum} / \mathrm{m}$ inim um occurtere $\mathrm{max}^{\mathrm{m}} \mathrm{m}^{\mathrm{in}}$ ) is the enhanced (suppressed) scattering cross section and the superscript $m$ ax ( $m$ in) indicates the $m$ axim al enhancem ent (suppression) as one goes through the phase of $A$. The denom inator of the ratio $R_{m}$ ax $\left(R_{m \text { in }}\right)$ chooses the larger ( $s m$ aller) value of the scattering cross section w ithout CP violation, i.e., for phase $=0$ or phase $=$.

Fig. 3 show s the enhancem ent and suppression factors of the neutralino annihilation cross section tim es relative velocity $v$ (at $v=0$ ). The ratios $R_{m \text { ax }}^{\text {ann }}$ and $R_{m \text { in }}^{\text {ann }}$ are de ned sim ilarly to $R_{m}$ ax and

Figure 2. $\quad \phi_{A} / \pi$
$R_{m \text { in }}$ but with $v$ replacing the scattering cross section .

Finally, in gs. 4 and 5 we show two examples of the behavior of the scattering and annihilation cross sections with the phase of A. T he four panels from top to bottom display the follow ing: the scattering cross section $p$ in pb , the anninilation cross section $v$ in $\mathrm{cm}^{3} / \mathrm{s}$, the branching ratio $B R(b!s) \quad 10^{4}$, and the lightest H iggs boson $m$ ass $m_{h_{1}}$ in $G e V$ as a function of the phase $A$ of A. CP conserving phases are A $=0$; while all other values are CP violating. In the third and fourth panels we hatch the regions currently ruled out by accelerator experm ents. In all four panels we denote the part of the curves that is experim entally allow ed by thickened solid lines, and the part that is experim entally ruled out by thinner solid lines. In this gure, the possible phases are bound by the lim it on the b! s branching ratio. In the allow ed regions, the scattering cross section at C P violating phases is suppressed, while the annihilation cross section is enhanced. T he latter takes itsm axim um allow ed valuewhen theb! s lim it is reached. In the case plotted in g. 4, both CP conserving cases are experim entally excluded while som e CP violating cases are allowed. T he scattering cross section is of the order of $10{ }^{6} \mathrm{pb}$, and lies in the region being probed by direct detection experim ents. The annihilation cross section peaks at ${ }_{A}=3=4$; notioe that this value is not the point ofm axim alCP violation $A=2$.
