A bstract
$P$ rovided the enhancem ent in the pp spectrum in radiative decay $J=$ ! pp observed by the BES collaboration is due to an existence of a pp $m$ olecular state, we calculate its binding energy and lifetim e in the linear m odel. W e consider a possibility that the enhancem ent is due to a pp resonance which is in ether $S-w$ ave or $P$ wave structure and com pare our results w th the data.

## 1 Introduction

R ecently, the BES collaboration has observed a near-threshold enhancem ent in the pp $m$ ass spectrum in the radiative decay $J=$ ! pp [ill $\mathrm{B}^{0}$ ! D 9pp and B ! ppK decays has been published by the B elle collaboration $\left[\frac{1}{2}\right]$.
$T$ here have been various interpretations for the observed enhancem ent. T he enhancem ent can be understood if the nal state interaction betw een $p$ and $p$ is properly considered, as som e
 from an interm ediate state of $+G$ where $G$ is a $0^{+}$or $0^{+}$gheball [if $]$. M eanwhile in analog to $a_{0}$ (980) and $f_{0}$ (980) which are supposed to be m olecular states of $K$ K, it is tem pted to assum e that pp constitute a bound state w th quantum num ber $0^{+}$or $0^{++}$.

U nder the assum ption, one needs to evaluate the corresponding binding energy and lifetim e , then com pare the theoretical results $w$ th the data. In this work, we em ploy the linear $m$ odel Historically, there has been dispute about the linear $m$ odel where the $m$ eson stands as a realistic scalarm eson [1] w hereas in altemative soenarios, it is suggested that the contribution of
 and non-linear $m$ odel is whether the $0^{++} \mathrm{m}$ eson is a substantial ob ject, it corresponds to the linear or non-linear realization of the chiral lagrangian $\dagger_{1}$ I. . Because the low -energy Q CD which is the underlying theory of hadron physics is fully non-perturbative, all the nonperturbative QCD param eters in the theory are so far not strictly derivable and have to be extracted by the data tting. Therefore, determ ination of these param eters is som ehow m odel-dependent and phenom enological. It is believed that at least for the leading order, all m odels would be applicable, even though they look som ew hat di erent. A s we em ploy the linear modelwhich is sim pler in calculations, we take all the coe cients by tting data.

In our earlier work [i-1], we used the linear m odel to calculate the properties of deuteron, and by tting data we not only determ ine the value ofm but also $x$ the corresponding param eters of the linear $m$ odel. In this work we will use the sam e modelwith the param eters obtained by tting the deuteron data to carry out all calculations for the pp bound state.

The present BES data do not nally decide if the resonance is an $\mathrm{S}-\mathrm{w}$ ave or $\mathrm{P}-\mathrm{w}$ ave bound state, but only indicate that the position of the $S$-w ave peak is below the threshold $2 \mathrm{~m}_{\mathrm{p}}$ whereas the peak of the $P$ w ave is a bit above the threshold. In our m odel, since the e ective potential for the $S$-w ave is attractive except a repulsive core near $r!0$, the binding energy $m$ ust be negative, so that the calculated $m$ ass of the $S$-w ave bound state is below the $2 \mathrm{~m}_{\mathrm{p}}$ threshold. W hereas for the P -w ave due to the angular m om entum barrier which is non-zero and positive, the binding energy becom es positive and the totalm ass is greater than $2 \mathrm{~m}_{\mathrm{p}}$.

To evaluate the $w$ idths for both $S$-w ave and $P$-w ave, we investigate the dissociation $m$ echanism of the pp bound state. Since the central value of the $m$ ass of the $S$-w ave bound state is sm aller than $2 m_{p}$, it dissolves into a pp pair via its $w$ idth tail where the available energy is su cient to produce a free pp pair. To evaluate the total width of the bound state, we need to achieve the im aginary part of the potential which is induced by the absonptive part of the loops in the pp elastic scattering am plitude (see the text for the concemed Feynm an diagram s and som e details). T hus according to the traditionalm ethod $[\underline{\underline{9}]}$, we derive the real part of the potential which $m$ ainly com es from the tree-level scattering am plitude where $t$-channelm esons are exchanged, inchuding , , and!. For the $S$-w ave bound state not only t-channelexchange, but also the s-channel annihilation contribute. N am ely in the s-channel, and ${ }^{0}$ are the inter$m$ ediate $m$ esons and they contribute a realpart and an im aginary part to the e ective potential, the s-channel contributions are proportional to a delta function ( $r$ ) in the non-relativistic approxim ation. Thus the eigenenergy becom es $\mathrm{E}_{\mathrm{Re}} \quad \frac{1}{2}$ and the tim e-factor is $\exp \left(\mathrm{i}_{\mathrm{Re}} \mathrm{t} \quad \overline{2} \mathrm{t}\right.$ ) and the corresponds to the totalw idth and $E_{R e} \quad$ is is a solution of the Schrodinger equation w ith a com plex potential.

For the P -w ave, the binding energy is positive and the angular m om entum barrier prevents dissociation of the bound state. It is noted that since $(0)=0$ for the $P$ wave, the im aginary part of the complex potential which is proportional to ( $r$ ), does not result in an im aginary part to the eigenenergy. The dissolution $m$ echanism of the bound state is the quantum tunnelling. By the W KB approxim ation method [1] $\overline{1}]$, the tunnelling transition proba-
bility is $\exp _{R_{b}}\left[\sum_{a}^{R_{b} p} \frac{2_{a}(N)}{2} d r\right]$, thus the total width of the $P$ wave bound state would be $2 \exp \left[2_{a}^{\mathrm{R}_{\mathrm{b}} \mathrm{p}} \frac{2(\mathrm{~N}}{\mathrm{E})} \mathrm{dr}\right]$, where $=\frac{\mathrm{m}_{\mathrm{p}}}{2}$ is the reduced m ass.

Substituting the potential no $m$ atter real and com plex, into the Schrodinger equation, and solving it, one obtain both the eigenenergies and eigenfunctions of both $\mathrm{S}-\mathrm{w}$ ave and $\mathrm{P}-\mathrm{w}$ ave bound states. Then we can evaluate the $m$ asses and total $w$ idths of the bound states. That is the strategy of this work.

This paper is organized as follow s. A fter this introduction, we derive the form ulation for the com plex potential w ith a brief introduction of the linear model. In sec. III, we substitute the potential into the Schrodinger equation and solve it to obtain the num erical result of the eigenenergy and eigenfunction, then obtain the $m$ asses and $w$ idths of the $S$ - and $P$ w ave bound states. In the section we also present all relevant param eters. T he last section is devoted to our conclusion and discussion.

## 2 The form ulation

(1) The necessary inform ation about the $m$ odel. In the linear $m$ odel, the e ective Lagrangian is

$$
\begin{equation*}
\mathrm{L}=\mathrm{g}(+55) \text {; } \tag{1}
\end{equation*}
$$

where is the wavefiunction of the nucleon. W hen we calculate the scattering am plitude, we introduce a form factor to com pensate the 0 -shell e ects of the exchanged $m$ esons. At each vertex, the form factor is w ritten as [i]

$$
\begin{equation*}
\frac{2}{2} \quad \mathrm{M}_{\mathrm{m}}^{2}, ; \tag{2}
\end{equation*}
$$

where is a phenom enological param eter and its value is near 1 GeV . It is observed that as $q^{2}$ ! 0 it becom es a constant and if $\quad M_{m}$, it tums to be unity. In the case, as the distance is in nitely large, the vertex looks like a perfect point, so the form factor is sim ply 1 or a constant. W hereas, as $q^{2}!1$, the form factor approaches to zero, nam ely, in this situation, the distance becom es very $s m$ all, the inner structure (quark, ghon degrees of freedom) would $m$ an ifest itself and the whole picture of hadron interaction is no longer valid, so the form factor is zero which cuts o the end e ects.

To derive an e ective potential, one sets $q_{0}=0$ and writes down the elastic scattering am plitude in the $m$ om entum space and then carries out a Fourier transform ation tuming the am plitude into an e ective potential in the con guration space. Follow ing the standard procedure [ఫ̄], we derive the e ective potential from the scattering am plitude. Below, we present som e details about the individual parts of the potential.
(2) The e ective potentials.
(i) T he real part of the potential.

H ere we rst consider the $m$ eson exchanges at the $t$-channel, because the interm ediate $m$ eson is a space-like, it cannot be on its $m$ ass-shell, so that does not contribute to the im aginary part of the e ective potential. Then wew illgo on discussing the s-channelcontributions in subsection (ii).
a. $V$ ia exchanging m eson:

Thee ective vertex is

$$
\begin{equation*}
\mathrm{L}=\mathrm{g} 5 \quad ; \tag{3}
\end{equation*}
$$

and obviously only ${ }^{0}$ can be exchanged in our case.
$T$ he scattering am plitude in the $m$ om entum space is

$$
V(q)=\frac{g_{N N}^{2}}{4 m^{2}\left(q^{2}+m^{2}\right)}\left(\begin{array}{ll}
1 & q)(2 \tag{4}
\end{array} \quad q\right){\frac{2}{2}+q^{2}}_{2}^{2}:
$$

Follow ing the standard procedure, we carry out a Fourier transform ation on $V$ ( $q$ ) and obtain the e ective potential in the con guration space:

$$
V(r)=\frac{g_{N N}^{2}}{4 m^{2}}\left(\begin{array}{lll}
1 & r \tag{5}
\end{array}\right)(2 \quad r) f(r)
$$

where

$$
\begin{equation*}
f(r)=\frac{e^{m r}}{4 r} \frac{e^{r}}{4 r}+\frac{\left(m^{2} r^{2}\right) e^{r}}{8}: \tag{6}
\end{equation*}
$$

b. Via and and! exchanges.

The e ective vertioes are respectively

$$
\begin{gather*}
\mathrm{L}=\mathrm{g} \quad ;  \tag{7}\\
\mathrm{L}=\mathrm{g}_{\mathrm{NN}} \quad \begin{array}{l}
\mathrm{a} A^{a} ; \quad \mathrm{a}=1 ; 2 ; 3 ; \\
\mathrm{L}!=\mathrm{g}_{\mathrm{NN} N}!\quad!\quad:
\end{array} \tag{8}
\end{gather*}
$$

The scattering am plitude via exchanging $m$ eson is

$$
V(q)=\frac{q_{N N}^{2}}{4 m^{2}\left(q^{2}+m^{2}\right)}\left[4 m^{2} \quad 4 p^{2} \quad q^{2} \quad 4(p \quad q) \quad i \quad(q \quad p)^{2}\right]^{2}+q^{2} \quad \text {; }
$$

through a Fourier transform ation, the potential is

$$
V(r)=\frac{g_{N N}^{2}}{4 m^{2}} 4 m^{2} f(r) \quad 4 p^{2} f(r)+r^{2} f(r)+4 i(p \quad r) F(r) \quad 2(L \quad S) F(r) ;
$$

where

$$
f(r)=\frac{e^{m r}}{4 r} \frac{e^{r}}{4 r}+\frac{\left(m^{2}{ }^{2}\right) e^{r}}{8}
$$

$$
F(r)=\frac{1}{r} \frac{@ r}{@} f(r):
$$

V ia exchanging vector-m eson (only ${ }^{0}$ contributes), the e ective potential is

$$
\begin{aligned}
V(r)= & \frac{9_{N N}^{2}}{4 m^{2}} 4 m^{2} f(r) \quad r^{2} f(r)+4 p^{2} f(r)+2(L \quad S) F(r) \quad 4 i(p \quad r) F(r) \\
& +\left(\begin{array}{ccc}
1 & r
\end{array}\right)(2 \quad r) f(r)
\end{aligned}
$$

where

$$
\begin{aligned}
f(r) & =\frac{e^{m r}}{4 r} \frac{e^{r}}{4 r}+\frac{\left(m^{2} r^{2}\right) e^{r}}{8} \\
F(r) & =\frac{1}{r} \frac{@}{@ r} f(r):
\end{aligned}
$$

For exchanging an ! vectorm eson, the expression is sim ilar to that in the case, but has an opposite sign to the contribution due to the G-parity $\overline{\underline{2}} \overline{1} \overline{1}, \overline{2} \overline{2} \overline{2}]$, thus one only needs to replace the corresponding param eter values, such as the $m$ ass and coupling constant for by that for ! and add a m inus sign in front of all the term sofV (r). For saving space, we dism iss the concrete expression for ! exchange.
C. The real part of the potential

A synthesis of all the individual contributions derived above stands as the real part of the e ective potential, nam ely the traditional part of the e ective potential as

$$
\begin{aligned}
\mathrm{V}_{\mathrm{eff}}(\mathrm{r}) & =\mathrm{V}(r)+\mathrm{V}(r)+\mathrm{V}(r)+\mathrm{V}_{!}(r) \\
& =\mathrm{V}_{0}(r)+\mathrm{V}_{\mathrm{LS}}(r)+\mathrm{V}_{\mathrm{pet}}(r)+\mathrm{V}_{\mathrm{T}}+\mathrm{V}_{\mathrm{SS}}:
\end{aligned}
$$

In the expression the leading part of the potential is

$$
\begin{aligned}
V_{0}= & \frac{e^{r} g_{N N}^{2}}{8} \frac{e^{r^{r} m^{2} g_{N N}^{2}}}{8}+\frac{e^{r} g_{N N}^{2}}{4 r} \frac{e^{m}{ }^{r} g_{N N}^{2}}{4 r}+\frac{e^{r} g_{N N}^{2}}{8} \\
& +\frac{e^{{ }^{r} m}{ }^{2} g_{N N}^{2}}{8} \frac{e^{r} g_{N N}^{2}}{4 r}+\frac{e^{m{ }^{r} g_{N N}^{2}}}{4 r}+\frac{e^{r}}{8} g_{N N!}^{2} \\
& +\frac{e^{r} g_{N N!}^{2}}{4 r} \frac{e^{m!r} g_{N N!}^{2}}{4 r}:
\end{aligned}
$$

The spin-orbit term is

$$
\begin{aligned}
& V_{L S}=\frac{e^{r}{ }^{r} g_{N N}^{2}}{8 m^{2} r^{3}} \frac{e^{m}{ }^{r} g_{N N}^{2}}{8 m^{2} r^{3}}+\frac{e^{r} g_{N N}^{2}}{8 m^{2} r^{2}} \frac{e^{m}{ }^{r} g_{N N}^{2} m}{8 m^{2} r^{2}}+\frac{e^{r}{ }^{2}{ }^{2} g_{N N}^{2}}{16 m^{2} r} \\
& \frac{e^{r}{ }^{r}{ }^{2} g_{N N}^{2}}{16 m^{2} r}+\frac{e^{2}{ }^{r} g_{N N}^{2}}{8 m^{2} r^{3}} \frac{e^{m}{ }^{r} g_{N N}^{2}}{8 m^{2} r^{3}}+\frac{e^{r} g_{N N}^{2}}{8 m^{2} r^{2}} \frac{e^{m} r^{2} g_{N N}^{2}}{8 m^{2} r^{2}} \\
& +\frac{e^{r{ }^{2} g_{N N}^{2}}}{16 m^{2} r} \frac{e^{{ }^{r} m^{2} g_{N N}^{2}}}{16 m^{2} r}+\frac{e^{r}{ }^{r} g_{N N}^{2}!}{8 m^{2} r^{3}}+\frac{e^{m!r_{N N}} g_{N}^{2}}{8 m^{2} r^{3}} \frac{e^{r} g_{N N!}^{2}}{8 m^{2} r^{2}} \\
& +\frac{e^{m!r^{r}}!g_{N N!}^{2}}{8 m^{2} r^{2}} \frac{e^{r^{2} g_{N N}^{2}!}}{16 m^{2} r}+\frac{e^{r^{2} m^{2} g_{N N}^{2}!}}{16 m^{2} r} \quad(L \quad S):
\end{aligned}
$$

The relativistic correction which in our later num ericalcom putations is treated as a perturbation to the leading part, is

$$
\begin{aligned}
& V_{\text {pet }}=\frac{e^{r}{ }^{3} g_{N N}^{2}}{8 m^{2}} \frac{e^{r} m^{2} g_{N N}^{2}}{8 m^{2}}+\frac{e^{r}{ }^{r} g_{N N}^{2}}{4 m^{2} r^{3}} \frac{e^{m}{ }^{r} g_{N N}^{2}}{4 m^{2} r^{3}}+\frac{e^{r} g_{N N}^{2}}{4 m^{2} r^{2}} \\
& \frac{e^{m}{ }^{r} m g_{N N}^{2}}{4 m^{2} r^{2}}+\frac{e^{r}{ }^{2} g_{N N}^{2}}{8 m^{2} r}+\frac{e^{{ }^{2} m^{2} g_{N N}^{2}}}{8 m^{2} r} \frac{e^{m}{ }^{2} m^{2} g_{N N}^{2}}{4 m^{2} r} \\
& +\frac{3 e^{r}{ }^{3} g_{N N}^{2}}{32 m^{2}} \frac{3 e^{r} m^{2} g_{N N}^{2}}{32 m^{2}}+\frac{e^{r}{ }^{2} g_{N N}^{2}}{4 m^{2} r^{3}} \frac{e^{m}{ }^{r} g_{N N}^{2}}{4 m^{2} r^{3}}+\frac{e^{r}{ }^{r} g_{N N}^{2}}{4 m^{2} r^{2}} \\
& \frac{e^{m}{ }^{r} g_{N N}^{2} m}{4 m^{2} r^{2}}+\frac{e^{r}{ }^{2} g_{N N}^{2}}{8 m^{2} r}+\frac{e^{{ }^{2} m^{2} g_{N N}^{2}}}{16 m^{2} r} \frac{3 e^{m}{ }^{2} m^{2} g_{N N}^{2}}{16 m^{2} r} \\
& +\frac{3 e^{r}{ }^{3} g_{N N}^{2}!}{32 m^{2}}+\frac{3 e^{r} m^{2}!g_{N N}^{2}!}{32 m^{2}} \frac{e^{{ }^{r} g_{N N}^{2}!}}{4 m^{2} r^{3}}+\frac{e^{m!r} g_{N N}^{2}!}{4 m^{2} r^{3}} \frac{e^{{ }^{2} g_{N N}^{2}!}}{4 m^{2} r^{2}} \\
& +\frac{e^{m!r} g_{N N!}^{2} m!}{4 m^{2} r^{2}} \frac{e^{r}{ }^{2} g_{N N!}^{2}}{8 m^{2} r} \frac{e^{{ }^{2} r}{ }^{2}!g_{N N!}^{2}}{16 m^{2} r}+\frac{3 e^{m!r^{2}{ }^{2}!g_{N N!}^{2}!}}{16 m^{2} r}:
\end{aligned}
$$

The tensor potential is

$$
\begin{aligned}
& V_{T}=\frac{e^{r}{ }^{r}{ }^{3} g_{N N}^{2}}{96 m^{2}} \frac{e^{r}{ }^{r} m^{2} g_{N N}^{2}}{96 m^{2}}+\frac{e^{r}{ }^{r} g^{2}}{16 m^{2} r^{3}} \frac{e^{m}{ }^{r} g_{N N}^{2}}{16 m^{2} r^{3}}+\frac{e^{r}{ }^{r} g_{N N}^{2}}{16 m{ }^{2} r^{2}} r \\
& \frac{e^{m}{ }^{r} m g_{N N}^{2}}{16 m^{2} r^{2}}+\frac{e^{r}{ }^{2} g_{N N}^{2}}{32 m^{2} r} \frac{e^{r^{2}{ }^{2} g_{N N}^{2}}}{96 m^{2} r} \frac{e^{m}{ }^{r} m^{2} g_{N N}^{2}}{48 m^{2} r} \\
& +\frac{e^{r{ }^{3} g_{N N}^{2}}}{96 m^{2}}+\frac{e^{r} m^{2} g_{N N}^{2}}{96 m^{2}} \frac{e^{r} g_{N N}^{2}}{16 m^{2} r^{3}}+\frac{e^{m}{ }^{r} g_{N N}^{2}}{16 m^{2} r^{3}} \frac{e^{r} g_{N N}^{2}}{16 m^{2} r^{2}} \\
& +\frac{e^{m{ }^{m} m} g_{N N}^{2}}{16 m^{2} r^{2}} \frac{e^{r}{ }^{2} g_{N N}^{2}}{32 m^{2} r}+\frac{e^{r_{m}{ }^{2} g_{N N}^{2}}}{96 m^{2} r}+\frac{e^{m} r^{2}{ }^{2} g_{N N}^{2}}{48 m^{2} r} \\
& +\frac{e^{r{ }^{3} g_{N N}^{2}!}}{96 m^{2}} \frac{e^{r} m^{2}{ }^{2} g_{N N!}^{2}!}{96 m^{2}}+\frac{e^{r} g_{N N!}^{2}}{16 m^{2} r^{3}} \frac{e^{m!r^{2} g_{N N}^{2}!}}{16 m^{2} r^{3}} \\
& +\frac{e^{r} g_{N N!}^{2}}{16 m^{2} r^{2}} \frac{e^{m!r^{2} m} g_{N N!}^{2}}{16 m^{2} r^{2}}+\frac{e^{r}{ }^{2} g_{N N!}^{2}}{32 m^{2} r} \frac{e^{r^{2} m^{2} g_{N N}^{2}!}}{96 m^{2} r} \\
& \frac{e^{m!r_{m}^{2}!g_{N N!}^{2}}}{48 m^{2} r} \frac{3(1 r)(2 r)}{r^{2}} \quad\left(\begin{array}{ll}
1 & 2
\end{array}\right) ;
\end{aligned}
$$

and the spin-spin term is

$$
\begin{aligned}
V_{S S}= & \frac{e^{r{ }^{3} g_{N N}^{2}}}{96 m^{2}} \frac{e^{r} m^{2} g_{N N}^{2}}{96 m^{2}}+\frac{e^{r^{2} m^{2} g_{N N}^{2}}}{48 m^{2} r} \frac{e^{m} m^{r} m^{2} g_{N N}^{2}}{48 m^{2} r} \\
& +\frac{e^{r}{ }^{3} g_{N N}^{2}}{48 m^{2}} \frac{e^{{ }^{r} m^{2} g_{N N}^{2}}}{48 m^{2}}+\frac{e^{r^{2} m^{2} g_{N N}^{2}}}{24 m^{2} r} \frac{e^{m}{ }^{r} m^{2} g_{N N}^{2}}{24 m^{2} r} \\
& +\frac{e^{r}{ }^{3} g_{N N}^{2}!}{48 m^{2}}+\frac{e^{r} m^{2}!g_{N N}^{2}!}{48 m^{2}} \frac{e^{r^{2} m^{2}!g_{N N}^{2}!}}{24 m^{2} r} \\
& +\frac{e^{m!m^{2}!g_{N N!}^{2}}}{24 m^{2} r}(1 \quad 2):
\end{aligned}
$$

$d . T$ he case of pp is di erent from the deuteron where the constituents are $p$ and $n$, nam ely there is a pp annihilation at the s-channel, which would contribute a delta fiunction to the e ective potential.

Ifpp is in $S-w$ ave $w$ ith quantum num ber $I^{G} J^{P C}=0^{+}\left(0^{+}\right)$, in the s-channelonly a $0^{+}\left(0^{+}\right)$ $m$ eson can be exchanged. H ere we only consider the low est-lying pseudoscalar $m$ esons of 0 + and ${ }^{0}$. Their contribution can be w ritten as

$$
\left.V^{0}(r)=\frac{9_{N N}^{2}}{\left(4 m^{2} m^{2}\right)} \frac{2 m^{2}}{4 m^{2} 2^{2}} \quad 1+\frac{(1 r)(2 r}{2 m^{2}}\right) \frac{r^{2}}{2 m^{2}}{ }^{3}(r) ;
$$

$w$ here $m$ is the invariant $m$ ass $p \overline{\left(p_{1}+p_{2}\right)^{2}}$ and $p_{1} ; p_{2}$ are the fourm om enta of the constituents $p$ and $p$ respectively, and it is very close to 2 mp . For the contribution of 0 , one only needs to replace the corresponding param eters values. It is noted that these contributions still belong to the real part of the e ective potential. Below, we will derive the im aginary contributions induced by the absonptive part of loops at s-channel.
(ii) T he im aginary part of the com plex potential.

The corresp onding Feynm an diagram s are shown in Figs. 1 and 2. Fig. 1 is the selfenergy of and ${ }^{0}$ which are o -shell and Fig2 is a box diagram. O bviously, the elastic scattering of pp is a strong-interaction process, so that parity, isospin etc. quantum num bers m ust be conserved and as long as the pp bound state is of the $0^{+}$structure, only and ${ }^{0}$ can be exchanged in the s-channel (w e neglect higher-resonances).

T he concemed couplings are $[1$

$$
\begin{align*}
& L_{P P}=\frac{P P}{P_{2}} @ P \quad @ ;  \tag{10}\\
& L_{V V p}=g_{V V p} \quad @ V(P \quad @) ; \tag{11}
\end{align*}
$$

here $P$ stands as pseudoscalar mesons, such as , and ${ }^{0}$ etc. and $V$ denotes vector $m$ esons, such as! and etc.
$T$ he im aginary part of the potential is obtained in the follow ing way. First, we calculate the absorptive part of the loops by the $C$ utkosky cutting rule in the $m$ om entum space [1] $\overline{1} \overline{1}]$ and carry out a Fourier transform ation tuming it into an im aginary part of the com plex potential.
(i) The contribution induced by the self-energy of and ${ }^{0}$.

W e have obtained

$$
\begin{aligned}
& V_{I_{m_{1}}}(r)=\frac{{ }^{2} g_{N N}^{2}\left(4 m^{2} m^{2}+m^{2}\right)^{2} q}{512 m^{2}\left(4 m^{2} m^{2}\right)^{2}} \frac{16 m^{2} m^{2}+\left(4 m^{2} m^{2}+m^{2}\right)^{2}}{} ; \\
& \frac{2 \mathrm{~m}^{2}}{4 \mathrm{~m}^{2}{ }^{2}}{ }^{2}(\mathrm{r}) \text {; for } \mathrm{F} \text { ig: }: 1 \text { (a): } \\
& V_{I_{m}}(r)=\frac{{ }^{2} f_{0} g_{N N}^{2}\left(4 m^{2} m_{f_{0}}^{2}+m^{2}\right)^{2} q}{512 m^{2}\left(4 m^{2} m^{2}\right)^{2}} \frac{16 m^{2} m^{2}+\left(4 m^{2} m_{f_{0}}^{2}+m^{2}\right)^{2}}{} \\
& \frac{2 \mathrm{~m}^{2}}{4 \mathrm{~m}^{2}{ }^{2}}{ }^{2}(\mathrm{r}) \text {; for } \mathrm{F} \text { ig: }: 1 \text { (b): }
\end{aligned}
$$

$$
\begin{aligned}
V_{\operatorname{Im} 3}(r)= & \frac{2}{a_{0} g_{N N}^{2}\left(4 m^{2} m_{a_{0}}^{2}+m^{2}\right)^{2} q} \frac{512 m^{2}\left(4 m^{2} m^{2}\right)^{2}}{16 m^{2} m^{2}+\left(4 m^{2} m_{a_{0}}^{2}+m^{2}\right)^{2}} \\
& \frac{{ }^{2} m^{2} m^{2}{ }^{2}{ }^{2}(r) ; \quad \text { for Fig: } 1 \text { (c) : }}{}
\end{aligned}
$$

and

b. The contributions induced by the box diagram

$$
\begin{aligned}
& \text { (i } \left.)^{2}\left(q^{2} m^{2}\right)\left(p_{1}+p_{2} \quad q\right\} \quad m^{2}\right) \frac{2}{\left(p_{1} q\right)^{2}{ }^{2}}{ }^{2} \frac{m^{2}}{\left(p_{3} q\right)^{2}{ }^{2}}{ }^{2} \text { : }
\end{aligned}
$$

Taking the Fourier transform ation, we obtain
where

$$
A=\frac{q}{m^{2}+B^{2}}
$$

and

$$
B=\frac{1}{4} \overline{16 m^{2} \quad 8 m^{2} \quad 8 m^{2}+16 p^{2}+\frac{m^{4}}{m^{2}+p^{2}} \quad \frac{2 m^{2} m^{2}}{m^{2}+p^{2}}+\frac{m^{4}}{m^{2}+p^{2}}:}
$$

Expanding the expression w ith respect to j jand keeping term $s$ up to $p^{2}$, we have the nal expression as

$$
\begin{aligned}
& V_{I_{\text {box }}}(r)=\frac{h \quad q_{N N}^{2} g_{N N}^{2}\left(4 m^{2} m^{2}+m^{2}\right)^{2}\left(m^{2}{ }^{2}\right)^{4}}{16 m^{4}\left(4 m^{2}+m^{2}+m^{2}\right)^{2}\left(2 m^{2}+m^{2}+m^{2} 2^{2}\right)^{4}} \\
& \mathrm{q} \overline{16 m^{4}+\left(m^{2} \quad m^{2}\right)^{2} \quad 8 m^{2}\left(m^{2}+m^{2}\right)^{2}}+O(m ; m \quad ; m \quad ; \quad) p^{2^{i}}{ }^{3}(r)
\end{aligned}
$$

where the coe cient $O(m ; m \quad ; m ;)$ of ${ }^{2}$ is obtained by a tedious but straightforw ard calculation, here for saving space we ignore the details.

Finally we obtain the im aginary part of the potential as

$$
V_{I_{m}}(r)=V_{I_{I_{1}}}(r)+V_{\operatorname{Im}_{2}}(r)+V_{I_{m}}(r)+V_{\operatorname{Im}_{4}}(r)+V_{I m_{b o x}}(r):
$$

It is also noted that for the $P$ w ave resonance, the w avefiunction at origin is zero, ie. $(0)=0$, at the leading order there is no s-channel contribution to the e ective potential, and neither the im aginary part in the nale ective potential, since in our approxim ation, all of them are proportional to ${ }^{3}(r)$.

In the practical com putation, a popular approxim ation [1"푼] for the delta function

$$
{ }^{3}(r) / \frac{3}{\frac{3}{2}} e^{2} r^{2}
$$

is adopted.

## 3 N um erical results

By solving the Schrodinger equation, we obtain the zero-th order engenenergy and wavefunction, where the L-S coupling and tensor term s are taken as perturbations and the im aginary part of the complex potential is treated in two ways. In term $s$ of the traditional m ethod of Q uantum M echanics, we can calculate the corrections.

For the $S-w$ ave resonance we obtain the binding energy and the totalw idth as

| $\mathrm{m}(\mathrm{G} \mathrm{eV})$ | 0.47 | 0.48 | 0.49 | 0.50 | 0.51 | 0.52 | 0.53 | 0.54 | 0.55 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(\mathrm{G} \mathrm{eV})$ | 0.59 | 0.60 | 0.61 | 0.62 | 0.63 | 0.64 | 0.65 | 0.66 | 0.67 |
| $\mathrm{E} \mathrm{s} \mathrm{(M} \mathrm{eV)})$ | -18.38 | -1723 | -16.19 | -15.30 | -14.47 | -13.67 | -13.03 | -12.42 | -11.88 |
| $\mathrm{~s}(\mathrm{M} \mathrm{eV})$ | 33.60 | 30.08 | 26.94 | 24.15 | 21.67 | 19.49 | 17.57 | 15.90 | 14.45 |

Table 1: the theoretical results for the $S$-w ave w ith perturbative $m$ ethod
$T$ he num ber listed in table. 1 are obtained in term $s$ of the pertunbation $m$ ethod. $N$ am ely, we take the im aginary part of the com plex potential as a perturbation as well as the L-S coupling and tensor term S ,

$$
E=<\quad 0 j H j 0>\text {; }
$$

where $H=H$ real $+i H$ im ag and 0 is the wavefunction of zero-th order.
A s we sandw ich the im aginary part of the complex potential betw een 0 , the expectation value is the im aginary part of the com plex eigenenergy as

$$
\text { i } \mathrm{E}_{\text {im ag }}=\frac{i}{2}=<0 \text { 所 } V_{I m}(r) j 0>\text {; }
$$

and

$$
\mathrm{iV}_{\mathrm{Im}}(\mathrm{r}) \quad \mathrm{i}_{\mathrm{H}}^{\mathrm{im} \mathrm{ag}} \text { : }
$$

Thus the total eigenenergy is

$$
E=E_{0}+E_{\text {real }}+E_{\text {im ag }}=E_{0}+E_{\text {real }}^{i_{2}}:
$$

Instead, one can solve the Schrodinger equation with a com plex potential which would be divided into two coupled di erential equations. The coupled equations cannot, in general, be solved analytically, but only num erically. W e obtain the com plex eigenenergy by solving the equation group and the results are listed in table 2 .

| $\mathrm{m}(\mathrm{G} \mathrm{eV})$ | 0.47 | 0.48 | 0.49 | 0.50 | 0.51 | 0.52 | 0.53 | 0.54 | 0.55 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(\mathrm{G} \mathrm{eV})$ | 0.59 | 0.60 | 0.61 | 0.62 | 0.63 | 0.64 | 0.65 | 0.66 | 0.67 |
| $\mathrm{Es} \mathrm{s} \mathrm{(M} \mathrm{eV)})$ | -14.10 | -13.64 | -13.17 | -12.71 | -12.25 | -11.81 | -11.38 | -10.99 | -10.62 |
| $\mathrm{~s}(\mathrm{M} \mathrm{eV})$ | 21.90 | 19.48 | 17.29 | 15.29 | 13.48 | 11.87 | 10.45 | 9.19 | 8.11 |

Table 2: the calculated results for the $S$ w ave w ith direct program calculating

C om paring the results in table 1 and 2 , we nd that there are som e deviations of no $m$ ore than $30 \%$, and generally, the num bers obtained in the perturbation $m$ ethod are a bit greater than them by directly solving the coupled equations, but qualitatively, the two sets are consistent. C onsidering the experim ental errons and theoretical uncertainties, we would conclude that the tw o sets of num bers agree w ith each other.

For the P wave, by solving the Schrodinger equation, we obtain the eigenenergy, and then by the W K B m ethod, we can estim ate the dissociation rate, which tums out to be the width of the $P$ wave resonance. $T$ he results are shown in $T a b l e 2$.

| $\mathrm{m}(\mathrm{G} \mathrm{eV})$ | 0.47 | 0.48 | 0.49 | 0.50 | 0.51 | 0.52 | 0.53 | 0.54 | 0.55 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left(10^{1} \mathrm{G} \mathrm{eV}\right)$ | 8.25 | 8.51 | 8.76 | 9.02 | 9.28 | 9.54 | 9.81 | 10.08 | 10.35 |
| $\mathrm{Ep}(\mathrm{M} \mathrm{eV})$ | 0.35 | 0.43 | 0.54 | 0.63 | 0.72 | 0.80 | 0.87 | 0.94 | 1.08 |
| $\mathrm{p}(\mathrm{M} \mathrm{eV})$ | 9.11 | 11.42 | 15.00 | 17.96 | 20.22 | 22.64 | 2426 | 25.91 | 29.98 |

Table 3: T he calculated values for $P$-w ave

For the theoretical calculations, we have em ployed the follow ing param eters as inputs: $m=$ $0: 938(\mathrm{G} \mathrm{eV}) ; \mathrm{m}=0: 138(\mathrm{G} \mathrm{eV}) ; \mathrm{m}=0: 77(\mathrm{GeV}) ; \mathrm{m}!=0: 783(\mathrm{G} \mathrm{eV}) ; \mathrm{m}=0: 547(\mathrm{G} \mathrm{eV}) ; \mathrm{m} 0=$
 $3: 25\left[\overline{1}_{1} \bar{T}_{1}\right] ; \frac{\mathrm{g}_{\mathrm{NN}}^{2}}{4}=0: 4 ; \frac{\mathrm{g}_{\mathrm{NN}}^{2}}{4}=0: 6[\underline{1} \mathrm{Z}] ; \quad=4: 11\left(\mathrm{G} \mathrm{eV}^{1}\right) ; \quad 0 \quad=2: 65\left(\mathrm{G} \mathrm{eV}^{1}\right) ; \quad \mathrm{f}_{0}=$

## 4 C onclusion and discussion

In this work, in term s of the linear m odelwe investigate the spectrum and totalw idth of the possible pp bound states. W e consider two possibilities that the observed enhancem ent is due to a pp bound state in $S$ - or $P$ waves respectively.

A llthe param eters em ployed in the calculations w ere obtained by tting the data ofdeuteron. $W$ ith the very precise $m$ easurem ent on the binding energy of deuteron and $m$ ore or less accurate estim ate of the $s-d m$ ixing and charge radius, there is only a narrow $w$ indow in the param eter space [ig]. N am ely there is alm ost not m uch free room to adjust them, and nether is a large range for changing our theoretical calculations, as long as the m odel is em ployed. Therefore the new ly observed resonance, if it is experim entally con m ed, can also provide an opportunity to further testify the linear model.
$W$ e derive the e ective potential betw een $p$ and $p$, and for the $S$ w ave structure, we sim ply substitute it into the schrodinger equation to obtain the binding energy. W e have also calculated the absorptive part of the concemed loops by the $C$ utkosky cutting rule and it becom es the im aginary part of the potential. D i erently from the deuteron case whidh is a bound state of pn, for the pp case, there exist s-channelprocesses (see the gures in the text), which can contribute a realpart (the tree levelm eson exchange) to the potential and an im aginary part through the loop diagram s in the channel and both of them are proportional to ( $r$ ) at the concemed nonrelativistic approxim ation. In this work, we ignore the dispersive part of the loops because it depends on the renorm alization schem e and only m akes a correction to the leading contribution of the real part of the potential, but keep the absonptive part which is the only source of the im aginary part of the potential.

W hen we solve the Schrodinger equation with a com plex potential, we have taken certain approxim ations to sim plify the calculations. T hen we obtain the $m$ ass and total $w$ idth of the S-w ave resonance.

It is also noted that due to the G-parity structure of the N N and N N system s where N refers to nucleons, the potentials contributed by and are of the same sign for the N N and N N system s , but the potential induced by ${ }^{0}$ and! should have opposite signs for the two system $s \underline{[2 \overline{2}} \overline{1}, \overline{2} \overline{2} \overline{2}]$. In fact, for the deuteron case, which is in the pn structure, the contribution of
${ }^{0}$ is repulsive, and so is that from and !. But for the pp system, ${ }^{0}$ and ! induce attractive potentials while the contribution induced by and rem ain unchanged. It can qualitatively explain why the the binding energy for pp (about 18 M eV ) is m ore negative than that for deuteron (about $2: 22 \mathrm{M} \mathrm{eV}$ ).

For the P -w ave case, where the w ave function oforigin is zero, i.e. $(0)=0$, one does not need to calculate the $s$-channel contribution. The angular $m$ om entum barrier prevents dissociation of the bound state, but the quantum tunnelling leads to a nal dissolution of the bound state and this tunnelling rate determ ines the total $w$ idth or lifetim e of the $P$ wave bound state of pp. $F$ ig. 3 show $s$ the e ective potential for $S$ wave and $P$ wave respectively. The repulsive part at the region of $s m$ all $r$ is due to the vector-m eson exchange. O ne also notes that for the $S-w$ ave, besides the repulsive core for $s m$ all $r$ the potential is attractive, whereas for the $P$ wave, there exists an angular barrier which results in an positive binding energy, i.e. the totalm ass of the P -w ave resonance is above the threshold of $2 \mathrm{~m}_{\mathrm{p}}$. Since the barrier is not high, the binding energy is not far above zero and the totalm ass is very close to 2 mp . To evaluate the tunnelling rate we use the W K B m ethod, however, since the barrier is not much higher than the binding energy level, using the W K B m ethod m ight bring up certain errors. T herefore the estim ated width can only be valid to its order of $m$ agnitude. Indeed, w ith present experim ental accuracy, we can satisfy ourselves w th such num bers, but de nitely the future experim ents can provide us w th $\mathrm{m} u \mathrm{ch}^{\mathrm{m}} \mathrm{m}$ ore inform ation and by them we will modify our m odel and determ ine the concemed
param eters to higher accuracy.
T he new ly observed enhancem ent by BES and B elle $m$ ay have various interpretations, one of them is due to a resonance of pp. In this work we discuss this possibility in the linear model and the obtained values are quantitatively consistent w ith the data. O ur num erical results show, the total w idth and position of the proposed bound state, no m atter $S-w$ ave or $P-w$ ave do not contradict the data, therefore both of them $m$ ay be possible states $w$ hich can accom $m$ odate the observed enhancem ent.

The authors of $\left[\begin{array}{l}{[1]}\end{array}\right]$ suggested an altemative explanation, i.e. the nalstate interaction results in the observed enhancem ent. To decide which mechanism is right or dom inant would wait for the future experim ents. W e hope that studies on the new resonance can enridh our know ledge about the hadron physics and the interactions at the hadron level. Our conclusion is that to con m the observed enhancem ent, $m$ ore precise $m$ easurem ents are needed.

A cknow ledgm ent:
W e thank K.T.Chao for his helpfill com ments and suggestions, we also bene trom the fruitfuldiscussions w ith C H. C hang. This work is partially supported by the N ational N atural Science Foundation of China.
