

THE HIGGS FIELD CAN BE EXPRESSED THROUGH THE LEPTON AND QUARK FIELDS.

R. A. Sharipov

Abstract. The Higgs field is a central point of the Standard Model supplying masses to other fields through the symmetry breaking mechanism. However, it is associated with an elementary particle which is not yet discovered experimentally. In this short note I suggest a way for expressing the Higgs field through other fields of the Standard Model. If this is the case, being not an independent field, the Higgs field does not require an elementary particle to be associated with it.

1. Matter fields of the Standard Model.

At the present moment the Standard Model is a commonly admitted and to a sufficient extent experimentally confirmed theory describing the electromagnetic, weak, and strong interactions. Elementary particles in the Standard Model are represented by matter fields. They include the lepton fields $\psi_{111111}^a[i]$, $\psi_{111}^a[i]$ and the quark fields $\psi^{a1}[i]$, $\psi^{a1111}[i]$, $\psi_{11}^a[i]$. The bullet over a ψ -function is the sign of chiral (left) components, while the circle is the sign of antichiral (right) components (see details in [1]). Through $a = 1; \dots; 4$ we denote a spinor index; $\alpha = 1; \dots; 3$ is a color index, it is peculiar to quark wave functions only. The index $i = 1; 2$ is a doublet index, ψ -functions possessing this index form doublets. Other ψ -functions are singlets. The index $i = 1; \dots; 3$ is enclosed into square brackets. It enumerates three generations of leptons and three generations of quarks. And finally, each of the above ψ -functions has some definite number of indices taking the only value $\alpha = 1$.

Apart from lepton and quark fields, there are gauge fields in the Standard Model. They are introduced as connection components in covariant derivatives. For instance, we have the following formula:

$$r_q^{a1}[i] = r_q[\text{vac}]^{a1}[i] + \frac{ieg_1}{\sim C} A_{q1}^{1a1}[i] + \frac{ieg_2}{\sim C} X^2 A_q^{a1}[i] + \frac{ieg_3}{\sim C} X^3 A_q^{a1}[i]; \quad (1.1)$$

The quantities A_q correspond to the gluon field. The quantities A_{q1}^1 and A_q correspond to the electromagnetic and weak fields respectively. Upon applying the Higgs mechanism they mix and form the 4-potential of the electromagnetic field A_q

and the fields of massive bosons Z_q and $W_{q111111}$. Here $q = 0; \dots; 3$ is a covectorial index. The nature of the index in the formula (1.1) is clear from the formula itself. It is sufficient to look at the ranges of this index in sums. Through g_1, g_2 , and g_3 we denote three purely numeric constants, they are parameters of the Standard Model. And finally, e, \hbar , and c in the formula (1.1) are the charge of electron, the Planck constant, and the light speed respectively:

$$\begin{aligned} e &= 4.80420440 \cdot 10^{10} \text{ g}^{1/2} \text{ cm}^{3/2} \text{ sec}^{-1}; \\ \hbar &= 1.05457168 \cdot 10^{27} \text{ g cm}^2 \text{ sec}^{-1}; \\ c &= 2.99792458 \cdot 10^{10} \text{ cm sec}^{-1}. \end{aligned}$$

The above data are taken from the site <http://physics.nist.gov/cuu/Constants> of the US National Institute of Standards and Technology.

The Higgs field ϕ^{111} is the most mysterious field of the Standard Model. It is associated with an elementary particle (the Higgs boson) which is not detected experimentally. This fact gives an opportunity for various Higgsless models, i.e. theories explaining the absence or invisibility of Higgs boson in collider experiments. Looking through the review [2] and some recent papers [3-7], I have found that most of these Higgsless models are produced as reductions of some higher-dimensional models. However, there is a much more simple purely 4-dimensional approach for eliminating the Higgs field from the stage. It is described below.

2. Composite Higgs fields.

As we have seen in the beginning of the previous section (see also [8]), the lepton and quark fields in the Standard Model are represented by ψ -functions with some definite number of indices. We can perform tensor products and contractions over some pairs of indices of the same nature. For example, we can write

$$\phi^{111}[\bar{i}] = \frac{X^4 X^4}{D_{aa} \bar{a}_{111111}[\bar{i}] \bar{a}_{111}[\bar{i}] D^{11} D^{11} D^{11} D^{11} D^{11} D^{11}}; \quad (2.1)$$

$a=1 \ a=1$

In a more general case we can mix the wave functions from different generations and write an expression similar to (2.1) for them:

$$\phi^{111}[\bar{i}\bar{j}] = \frac{X^4 X^4}{D_{aa} \bar{a}_{111111}[\bar{i}] \bar{a}_{111}[\bar{j}] D^{11} D^{11} D^{11} D^{11} D^{11} D^{11}}; \quad (2.2)$$

$a=1 \ a=1$

Here D_{aa} are the components of the Hermitian metric D in the bundle of Dirac spinors DM over the space-time manifold M . Similarly, D^{11} are the contravariant components of the Hermitian metric D in the one-dimensional bundle UM (see [8], [9], and [10] for more details).

The functions (2.1) and (2.2) have the same list of indices as the Higgs field ϕ^{111} . They are so called composite Higgs fields produced from the lepton fields.

The quark elds are also capable to produce composite Higgs elds:

$$\hat{F}^{111} [ij] = \frac{X^4 X^4 X^3 X^3 X^2 X^2}{a=1 a=1 =1 =1 =1 =1} d D D_{aa} D \quad (2.3)$$

$$\overline{a1 [i] a111 [j] D_{11}} :$$

This is not the only way for producing composite Higgs elds from the quark elds. Here is the other formula for other composite Higgs elds:

$$F^{111} [ij] = \frac{X^4 X^4 X^3 X^3}{a=1 a=1 =1 =1} D_{aa} D \overline{a_{11} [i] a1 [j] D^{11} D^{11}} : \quad (2.4)$$

In addition to D and D , in (2.3) and (2.4) we have the components D of the Hermitian metric D in three-dimensional color-bundle SUM over the space-time manifold M , the components D of the Hermitian metric D in two-dimensional bundle SUM , and the components d of the skew-symmetric metric tensor d in the same bundle SUM (see [10] again).

Composite Higgs elds (2.2), (2.3), and (2.4) can be used in order to construct the actual Higgs eld $'^{111}$ as a linear combination:

$$\begin{aligned} '^{111} = & \sum_{i=1}^3 \sum_{j=1}^3 C [ij] f^{111} [ij] + \\ & + \sum_{i=1}^3 \sum_{j=1}^3 \hat{C} [ij] \hat{F}^{111} [ij] + \sum_{i=1}^3 \sum_{j=1}^3 C [ij] F^{111} [ij] : \end{aligned} \quad (2.5)$$

The formula (2.5) leads to a theory very similar to the Standard Model. This theory will be considered in a separate paper.

3. Acknowledgments.

I am grateful to I.R.G abdrakhmanov, S.G.G lebov, A.N.K hairullin, O.M.K iseev, Yu.A.K ordyukov, T.A.Semenova, and B.I.Suleymanov for encouraging interest to my exercises with the Standard Model. I am also grateful to A.Sukachev who communicated me the reference to the paper [2].
