The effects of a strongly interacting Higgs sector

on $W_L^+ W_L^- ; Z_L^0 Z_L^0$ scattering

We study the effects of a strongly interacting Higgs sector on the amplitudes for $W_L^+ W_L^- ; Z_L^0 Z_L^0$ by unitarizing the $W_L^+ W_L^- ; Z_L^0 Z_L^0$ system using the K matrix technique. Unitarization produces substantial corrections to the cross sections for gauge boson pair production by photon fusion when $m_H > 5 - 10$ TeV.

I. INTRODUCTION

The possibility of producing high-luminosity photon beams by backscattering laser beams from high energy polarized electrons has prompted theoretical investigations suggesting that the photon fusion processes

$$! W_L^+ W_L^- ; Z_L^0 Z_L^0 ; \quad (1)$$

can be used to probe the Higgs sector of the standard model [1] as well as to explore the symmetry breaking sector of its non-linear Chiral Lagrangian generalizations [2]. It has also been shown that the photon fusion processes of Eq.(1) can be used in the search for ultraheavy fermions at high energy hadron colliders [3]. In either case, the $W_L^+ W_L^-$ and $Z_L^0 Z_L^0$ signals receive large contributions from one-loop diagrams containing $W_L^- ; Z_L^0$ and Higgs bosons, H [1].

In this paper, we examine the effect of a strongly interacting Higgs sector on the photon fusion by unitarizing the s-wave amplitudes for $W_L^+ W_L^- ; Z_L^0 Z_L^0$ and scattering using the K-matrix formalism [4,5]. It is then possible to increase the longitudinal coupling strength $= g^2 m_H^2 = 8m_W^2$ by varying m_H . Additionally, the Higgs width is introduced in a manner which preserves the Goldstone-boson equivalence theorem [6-8].

II. UNITARIZATION

We define the $3 \times 3 ; J = 0$ t-matrix as

$$t_0 = \begin{pmatrix} a+b & \frac{a}{2} & \frac{d}{2} \\ \frac{a}{2} & \frac{1}{2}a+b & \frac{a}{2} \\ \frac{d}{2} & \frac{a}{2} & \frac{f}{2} \end{pmatrix} ; \quad (2)$$

where $\frac{p}{2} = \frac{p}{2}$. The rows and columns of t_0 are labeled by $W_L^+ W_L^- ; Z_L^0 Z_L^0 = \frac{p}{2}$ and $\frac{p}{2}$, and the Born level partial wave projections a and b are given by [7]

$$a = \frac{1}{8} \frac{s}{m_H^2} \quad (3)$$

$$b = \frac{1}{8} \left(1 - \frac{m_H^2}{s} \right) \ln \left(1 + \frac{s}{m_H^2} \right) \quad (4)$$

In Ref. [1], it is shown that the one-loop $Z_L^0 Z_L^0$ amplitude is proportional to a for $m_W^2 \rightarrow 0$. For the $W_L^+ W_L^-$ case, the one-loop correction to the s-wave amplitude is also real for $m_W^2 \rightarrow 0$, since the Born amplitude vanishes in this limit. However, explicit calculations show that the Born term, though proportional to m_W^2 , is not negligible for interesting values of the center of mass energy $\sqrt{s}$. Consequently, the s-wave amplitude d is taken to be

$$d = 2 \frac{m_W^2}{s} \ln \frac{1 + \frac{m_W^2}{s}}{1 - \frac{m_W^2}{s}} - \frac{1}{8} \frac{s}{m_H^2} \left(1 + \frac{2m_H^2}{s} \operatorname{Li}_2 \left(-\frac{s}{m_H^2} \right) + \left(1 + \frac{m_H^2}{s} \right) \ln \left(1 + \frac{s}{m_H^2} \right) \right) \quad (5)$$

Since we are only interested in effects of order α^2 and α , we can ignore the photon-photon partial wave amplitude f [9]. We also consider the case of photons with helicity $\lambda = 1$, which is appropriate for the case of backscattered laser photons.

Including terms through order α^2 , the eigenvectors of the matrix t_0 are

$$\mathbf{v}_1 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 \\ \frac{1}{6} \frac{y^2}{c^2} \\ \frac{2}{9} \frac{xy}{ac} \end{pmatrix}; \quad \mathbf{v}_2 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 \\ \frac{1}{6} \frac{y^2}{c^2} + \frac{4}{9} \frac{xy}{ac} \\ \frac{1}{3} \frac{y}{c} \end{pmatrix}; \quad \mathbf{v}_3 = \frac{1}{\sqrt{3}} \begin{pmatrix} y \\ c \end{pmatrix} \quad (6)$$

$$\mathbf{v}_2 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 \\ \frac{1}{3} \frac{x^2}{b^2} + \frac{4}{9} \frac{xy}{ab} \\ \frac{2}{9} \frac{xy}{ab} \end{pmatrix}; \quad \mathbf{v}_3 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 \\ \frac{1}{3} \frac{x^2}{b^2} \\ \frac{2}{9} \frac{xy}{ab} \end{pmatrix}; \quad \mathbf{v}_4 = \frac{1}{\sqrt{3}} \begin{pmatrix} x \\ b \end{pmatrix} \quad (7)$$

$$\mathbf{v}_3 = \frac{1}{\sqrt{3}} \begin{pmatrix} x \\ b \\ \frac{y}{c} \end{pmatrix}; \quad \mathbf{v}_4 = \frac{1}{\sqrt{3}} \begin{pmatrix} 2x \\ 3b + \frac{1}{3} \frac{y}{c} \end{pmatrix}; \quad \mathbf{v}_5 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 \\ \frac{1}{6} \frac{y^2}{c^2} \\ \frac{1}{3} \frac{x^2}{b^2} \end{pmatrix} \quad (8)$$

where $c = \frac{3}{2}a + b$, $x = \frac{1}{2}(a - d)$ and $y = \frac{1}{2}(a + 2d)$. It is easy to check that if U is the matrix whose columns consist of $\mathbf{v}_1$, $\mathbf{v}_2$ and $\mathbf{v}_3$, the product $U^T t_0 U$ is diagonal. The corresponding eigenamplitudes are

$$t_1 = c + \frac{1}{3} \frac{y^2}{c} \quad (9)$$

$$t_2 = b + \frac{2}{3} \frac{x^2}{b} \quad (10)$$

$$t_3 = \frac{2}{3} \frac{x^2}{b} - \frac{1}{3} \frac{y^2}{c} \quad (11)$$

To obtain the K -matrix unitarized amplitudes, the a_i are replaced by

$$a_i \rightarrow a_i^K = \frac{a_i}{(1 - i a_i)}; \quad (12)$$

and the diagonal T -matrix is transformed back to the basis of physical states with the aid of the matrix U .

III. RESULTS

Proceeding in the manner outlined in Sec.(II), the unitarized s -wave amplitudes for the production of W_L and Z_L^0 pairs are

$$a_0^K(\gamma \rightarrow W_L^+ W_L^-) = \frac{2}{3} \frac{B}{a} \frac{y}{1 - i(c + \frac{1}{3} \frac{y^2}{c})} - \frac{x}{1 - i(b + \frac{2}{3} \frac{x^2}{b})} \frac{C}{A}; \quad (13)$$

$$a_0^K(\gamma \rightarrow Z_L^0 Z_L^0) = \frac{2}{3} \frac{B}{a} \frac{y}{1 - i(c + \frac{1}{3} \frac{y^2}{c})} + 2 \frac{x}{1 - i(b + \frac{2}{3} \frac{x^2}{b})} \frac{C}{A}; \quad (14)$$

where we have dropped terms of order s^{-3} , and removed the symmetry factors associated with the identity of the γ 's and Z_L^0 's. Taking into account the definitions of a , b and d , it can be seen that, at the Higgs pole, the unitarized amplitudes introduce a width which is equal to the sum of $(\gamma \rightarrow W_L^+ W_L^-)$, $(\gamma \rightarrow Z_L^0 Z_L^0)$ and $(\gamma \rightarrow \gamma\gamma)$.

The cross sections obtained from these amplitudes are displayed in Figs. (1-3). For Higgs masses of .7 TeV and 1.0 TeV, the cross sections are in good agreement with those of Ref. [1]. This is consistent with the situation found for the unitarized gauge boson scattering amplitudes [4,5]. When m_H exceeds a few TeV, the unitarized amplitudes rise less rapidly than those presented in Ref. [1], and the maximum cross section for large m_H is about a factor of three smaller. Fig. (3) shows the contribution of the one-loop correction to the cross section for $\gamma \rightarrow W_L^+ W_L^-$ scattering. A comparison of this figure with the result for the complete amplitude, Fig.(2), shows that the Born and one-loop amplitudes interfere substantially.

In conclusion, we find that unitarity corrections to the cross sections for $\gamma\gamma \rightarrow Z_L^0 Z_L^0$ and $\gamma\gamma \rightarrow W_L^+ W_L^-$ are large for $m_H > 5 \text{ TeV}$. Nevertheless, in the large m_H limit there is still a cross section on the order of several femtobarns for either of these processes. This implies that searches for ultraheavy fermions which make use of photon fusion [3] must take into account the sources of gauge boson pairs discussed here.

ACKNOWLEDGMENTS
