GLUEBALL PLUSPION PRODUCTION

IN HARD EXCLUSIVE TW O-PHOTON PROCESSES

A bstract

We here compute the reaction ! G 0 for various glueball candidates G and their assumed quantum states, using a non-relativistic gluon bound-state model for the glueball.

1 Introduction

A model for computing the production and decay of glueballs (G) made up of two gluons, in any quantum state, has been proposed by K ada et al. [1], who used it in order to calculate the processes J= ! G and G, . That model was later generalized for more complex reactions by Houra-Yaou et al. [2]; the generalized formalism was applied, in particular, to the calculation of glueball production in high-energy hadron collisions.

The values obtained in Ref. [1] for (G !), considering the main existing glueball candidates, are rather small, and system atically below the experim ental limits established till now in measurements of ! G . The purpose of this paper is to compute an alternative photon-photon collision process producing glueballs, i.e. $! G ^0 .$ The model used in this study is again that of Ref. [2].

Let us notice that the pseudoscalar glueball candidate (1440) was seen in various measurements of radiative J= decays [3]. On the other hand, two new analyses of J=! (1440) performed by the Mark III and the DM 2 Collaboration [4] both seem to show that, instead of corresponding to a single pseudoscalar resonance, the (1440) peak should be due to three dierent structures (two pseudoscalar and one axial) located close to each other in the 1400-1500 MeV range. However the conclusions of the two analyses are contradictory.

As for the tensor glueball candidate f_2 (1720), it was seen as well by various

experim ental groups in radiative J= decay [5] and also by the WA 76 Collaboration in double-di ractive pp collisions [6]. Here again some doubt has been cast on the true nature of this resonance by a recent analysis of Mark III [7]. A coording to this analysis it should rather be a scalar particle, f_0 (1710), and is unlikely to be a glueball. Thus there is, here again, an obvious disagreement between various experimental groups (see [8]).

Finally, as regards the X (2220), it was also found by the M ark III Collaboration in radiative J= decay, and was assigned the quantum numbers: J even (without further precision), P=+ [9]. On the other hand, it was recently seen by two experimental groups in hadronic reactions, but they disagreed on its spin value ($J^P=2^+$ vs. $J^P=4^+$) [10]; specialists now tend to believe that the X is rather a ss quarkonium state belonging to the nonet 3F .

It is obvious that, in all three cases considered, no m conclusion has yet been reached as to the nature of these resonances. Therefore we consider that none of them has been discarded as a glueball candidate, and we continue treating them as in previous papers [1, 2].

2 D etails of calculation

A ssum ing, here again, the glueball to be a weakly bound state of two non-relativistic gluons, we are led (see Sec. II of Ref. [2]) to the formula

$$M = \int_{0_{1}^{1}}^{0_{1}^{2}} \frac{1}{g} = \int_{0}^{1} \frac{1}{g} \frac{$$

connecting the helicity am plitudes of the process 0 ! 0 with those of the subprocess 0 ! 0 ! 0 ! 0 with those of the subprocess 0 ! $^$

$$^{LSJ}_{_{1}}$$
 (;) = d^{J} e i hLS0 jLSJ ihl1 $_{1}$ 2 j11S i (2)

where = $_1$ $_2$. Finally, is the velocity of either gluon in the glueball rest fram e, while f_L is given by

$$f_{L} = \frac{\frac{3}{2L+1}}{2M} \frac{2i^{L}}{M} \frac{(2L+1)!!}{L!} \frac{2}{4} \frac{d}{dr} R_{L} (r)^{5}$$
(3)

where M is the glueballm ass, and R $_{\rm L}$ (r) its radial wave function in con guration space.

As in Ref. [2], we assume the glueball to be relativistic in the 0 cm. frame: $M = {}^{p} = {}^{q} = {}$

For the calculation of those am plitudes, we use the Brodsky-Lepage m odel [11], i.e.:

$$M = \begin{pmatrix} 0; & 1 & 2 & 0 \\ 0! & g_1 & g_2 & 0 \end{pmatrix} (s; ; ;) = \begin{pmatrix} Z & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ &$$

where is the pion distribution amplitude, while in the calculation of $^{0}_{1}, ^{1}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{2}, ^{2}_{1}, ^{2}_{2}, ^{2$

We then remain with the task of applying formulas (4) and (1). A ctually, we not more convenient to integrate over; rst, applying formula (1), and to leave the convolution over (x) for the following stage of our calculation.

Formula (1), where we substitute (q q) $_{PS}$ for 0 , leads us, for the var-

ious quantum states considered (for the main glueball candidates) to the expressions M $_{0!}^{0}$ $_{G (q q)_{PS}}^{0}$ shown hereafter. We here xed = +1, since amplitudes with = 1 are derived therefrom by applying the relation M $_{0}^{0}$ = $_{1}^{0}$ $_{2}^{0}$ $_{3}^{0}$ $_{4}^{0}$ $_{5}^{0}$ $_{5}^{0}$ $_{6}^{0}$ $_{7}^{0}$ $_{1}^{0}$ $_{1}^{0}$ $_{1}^{0}$ $_{2}^{0}$ $_{3}^{0}$ $_{4}^{0}$ $_{5}^{0}$ $_{5}^{0}$ $_{6}^{0}$ $_{1}^{0}$ $_{1}^{0}$ $_{1}^{0}$ $_{2}^{0}$ $_{3}^{0}$ $_{4}^{0}$ $_{5}^{0}$ $_{5}^{0}$ $_{6}^{0}$ $_{6}^{0}$ $_{7}^{0}$ $_{7}^{0}$ $_{7}^{0}$ $_{8}^{0}$ $_{9}^{0$

All other helicity amplitudes are vanishing at that order.

Let
$$\cos = u$$
, $N = x (1 x) s$, $y = 2 (1 x) (1 + u)$, $y_1 = 1 + u (1 2x)$ and $z = 1 + u 2x$.

In addition we set:

$$A_1 = 2(1 u)(1 2x) u \frac{y}{z}$$

$$B_1 = \frac{2u}{z}$$

$$C_1 = 4x^2 (1 + u) + 2 (u + 3) (1 2x) + 2 (1 x) (1 u^2) + (4 (x 1)^2 1 u^2) \frac{y}{z}$$

$$D_1 = 4(1 x)(1 + u)$$

$$A_2 = 4(1 x)\frac{y}{z}$$

$$B_2 = 4 \frac{(1 - x)}{z}$$

$$C_2 = 2(1 + u)(1 - x)(2x + 1 - u) + (4(x - 1)^2 + 1 - u^2)\frac{y}{z}$$

$$D_2 = 4(1 \times (1 u))$$

W e get:

$$J = 0; L = S = 0$$

$$M_{0! G (q q)_{PS}}^{++;0} = 8 \frac{B_1 y_1 A_1}{y_1 N}$$
 (5)

$$M \stackrel{+}{\circ_{!}} \stackrel{; 0}{\circ_{!}} = 8 \frac{B_2 y_1 A_2}{y_1 N}$$
 (6)

$$J = 0; L = S = 1$$

$$M_{0! G (q q)_{PS}}^{++;0} = 8 \frac{C_1 z}{3 y_1^2 N}$$
 (7)

$$M + \int_{0_{1}}^{0} G (q q)_{PS} = 8 \frac{C_{2} z}{3y_{1}^{2} N}$$
 (8)

$$J = 2; L = 0; S = 2$$

$$M_{0! G (q q)_{PS}}^{++;0} = 16 \frac{B_1 y_1 A_1}{y_1 N}$$
 (9)

$$M^{++;2}_{0! G (q q)_{PS}} = 16 \frac{D_1}{y_1 N}$$
 (10)

$$M + \int_{0_{1}}^{0} G (q q)_{PS} = 16 \frac{B_{2} y_{1} A_{2}}{y_{1} N}$$
 (11)

$$M + \frac{7}{0!} \frac{2}{G (q q)_{P S}} = 16 \frac{D_2}{V_1 N}$$
 (12)

$$J = 2; L = 2; S = 0$$

$$M_{0! G (q q)_{PS}}^{++;0} = 32 \frac{B_1 y_1^3 A_1 (z^2 + y_1^2)}{15 y_1^3 N}$$
 (13)

$$M_{0! G (q q)_{PS}}^{++;2} = 64 \frac{D_1}{15 y_1 N}$$
 (14)

$$M + i_{0! G (q q)_{P S}}^{0} = 32 \frac{B_2 y_1^3 A_2 (z^2 + y_1^2)}{15 y_1^3 N}$$
 (15)

$$M + ; 2 0! G (q q)_{P S} = 64 \frac{D_2}{15 v_1 N}$$
 (16)

J = 2; L = S = 2

$$M_{0! G (q q)_{P S}}^{++;0} = 8 \frac{17 B_1 y_1^3 + A_1 (4z^2 17y_1^2)}{15 y_1^3 N}$$
 (17)

$$M_{0! G (q q)_{PS}}^{++;2} = 16 \frac{D_1 (4z^2 3y_1^2)}{15 y_1^3 N}$$
 (18)

$$M + \int_{0_{1} G (q q)_{PS}}^{0} = 8 \frac{17 B_{2} y_{1}^{3} + A_{2} (4z^{2} 17y_{1}^{2})}{15 y_{1}^{3} N}$$
 (19)

$$M + \int_{0_{1}}^{2} \int_{G}^{2} (q \, q)_{PS} = 16 \frac{D_{1} (4z^{2} - 3y_{1}^{2})}{15 y_{1} N}$$
 (20)

J = 4; L = S = 2

$$M_{0! G (q q)_{PS}}^{++;0} = 128 \frac{B_1 y_1^3 A_1 (z^2 + y_1^2)}{75 y_1^3 N}$$
 (21)

$$M_{0! G (q q)_{PS}}^{++;2} = 64 \frac{D_1 (z^2 + y_1^2)}{15 y_{n1}^3 N}$$
 (22)

$$M + \int_{0_{1} G (q q)_{PS}}^{0} = 128 \frac{B_{2} y_{1}^{3} A_{2} (z^{2} + y_{1}^{2})}{75 y_{1}^{3} N}$$
 (23)

$$M + i_{0! G (q q)_{P S}}^{2} = 64 \frac{D_{2} (z^{2} + y_{1}^{2})}{15 y_{1}^{3} N}$$
 (24)

In the above form ulas, coupling constants, as well as charge and color factors, were left aside.

For we here choose two di erent expressions given in the literature, namely that of Chernyak and Zhitnitsky [12]

$$^{CZ}(x) = 5 \frac{p}{3} f x (1 x) (2x 1)^2$$
 (25)

and the so-called asymptotic distribution amplitude [11]

$$^{as}(x) = ^{p} \overline{3} f x (1 x)$$
 (26)

where f is the pion leptonic decay constant.

Convolution of w ith formulas (5) -- (24) then leads us to the amplitudes $M = \binom{0}{0}$, $\binom{0}{0}$, $\binom{0}{0$

Therefrom one obtains the corresponding di erential cross section:

$$\frac{d}{dt} = 4 \frac{3^{2} + 2^{2}}{s^{2}} f_{ch}^{2} f_{c}^{2} M = 0; G = 0$$
 (27)

where the charge and color factors are easily obtained as : f_{ch}^2 = 1=18, f_c^2 = 2=3.

This expression of the cross section still contains an undeterm ined constant, f_L^2 (see formula (1)). In order to eliminate it, we use the same procedure as in Refs. [1] and [2], i.e. we write:

$$\frac{d \quad \circ_{! G} \quad \circ}{dt} \quad B \quad (G \quad ! \quad x \quad y) \qquad \frac{d \quad \circ_{! G} \quad \circ}{dt} \quad \frac{(J= \; ! \; G \;) \; B \; (G \quad ! \quad x \; y)}{(J= \; ! \; G \;)} \quad (28)$$

where B(G:xy) is the branching ratio for glueball decay in a given channel (actually we shall only consider the main decay channel for each glueball candi-

date). Then the numerator of the second factor on the rh. side of (28) is given by experimental measurements, while for its denominator we use the expression computed by K ada et al. [1,13]. In this way we get rid, actually, not only of f_L^2 , but also of the (not very well de ned) factor $\frac{2}{s}$. Eventually no free parameter is left.

Our results are shown in Figs. 3, 4 and 5, for the three glueball candidates (1440) ($J^{PC} = 0^+$), f_2 (1720) ($J^{PC} = 2^{++}$) and X (2220) ($J^{PC} = 0^{++}$) or 2^{++} or 4^{++}) and with the same assumptions as in Ref. [1] regarding the values of L; S [14]. In Fig. 3 we also show, for comparison, the prediction of the model of Ref. [11] for 0! 0!

3 Discussion

Our results call for several com m ents:

- (i) Quite generally, the yields obtained with the Chernyak-Zhitnitsky pion distribution amplitude are slightly higher (by a factor of 3-4) than those provided by the asymptotic one, while the shape of the curves is very similar. It should be recalled that the Chernyak-Zhitnitsky distribution function should be the more reliable one, since it allows for a correct normalization of the charged pion's electromagnetic form factor with a realistic value of s.
- (ii) The validity of the QCD perturbation expansion (p_T $^>$ 1 GeV) entails a lower lim it $^p \overline{s_{m \ in}}$ 2 M for the cm. energy range where our model may be

checked. With such a limit, our relativistic approximation (M = s = 1) 0) should be justified as well, all the more as it can be shown that, if we make a series expansion of the cross section in powers of $M^2 = s$, only even powers occur in that expansion; i.e. the rst term here neglected is of order $M^2 = s$.

- (iii) C ross sections for ! G and ! G 0 are easily derived from those here obtained if one assumes that the wave functions of ;; 0 are of the same type. Then, taking the experimentally determined values [15] f ' 0:98f, f $_0$ ' 0:84f, and $_{\rm m\ ixing}$ ' 23, one obtains for the relative yields of G 0 : G 0 production the approximate values 1:14:11.
- (iv) In a recent paper, W akely and Carlson [16] com puted the same cross section, using a dierent procedure, namely applying the model of Ref. [11] for both the pion and the glueball, with the glueball distribution amplitude G determined by QCD sum rules. They gave numerical results for the production, in a collision, of an assumed pseudoscalar glueball of mass 2 GeV together with a O. Thus in their work and ours dierent glueball candidates involving dierent masses and/or quantum states are considered. Therefore, strictly speaking, it would not make much sense to compare their results with ours. Nevertheless, one may observe that they are in the same ballpark.
- (v) For the (1440), for the quantum states L = m and L = 2" (see [14]) of the f_2 (1720) and for the quantum state J = 4 of the X (2220), our predictions based on the Chernyak-Zhitnitsky distribution amplitude lead to values

of (e⁺ e ! e⁺ e G 0) (integrated above p_{T} ' 1 G eV) that should be of the order of 10 37 cm 2 at p \overline{s} = 200 G eV (LEP II energy).

(vi) The formalism here used can be extended, in a trivial way, to the computation of glueball plus meson production in hadron collisions.

A cknow ledgm ents
