#### Abstract

We consider a two-dimensional integrable Hamiltonian system with a vector and scalar potential in quantum mechanics. Contrary to the case of a pure scalar potential, the existence of a second order integral of motion does not guarantee the separation of variables in the Schrödinger equation. We introduce the concept of "quasiseparation of variables" and show that in many cases it allows us to reduce the calculation of the energy spectrum and wave functions to linear algebra.

## 1 Introduction

A systematic search for integrable classical Hamiltonian systems in magnetic fields was started quite some time ago [3, 16, 17. A Hamiltonian containing scalar and vector potentials was introduced in a two-dimensional Euclidean space and additional integrals of motion were constructed as linear or quadratic polynomials in the momenta. The same problem in quantum mechanics was investigated quite recently [2]. Some new features have emerged in this study of vector potentials that distinguish this case from that of purely scalar ones.

1. The existence of second order integrals of motion does not imply the separation of variables in the Hamilton-Jacobi, or Schrödinger equation.
2. Hamiltonian systems with second order integrals of motion in classical and in quantum mechanics do not necessarily coincide [2].
3. In quantum mechanics an additional problem arises: it is necessary to choose a convenient gauge in which to write and solve the Schrödinger equation.

In the case of Hamiltonians with purely scalar potentials, quantum and classical integrable systems may also differ, but only if the integrals of motion are third, or higher order in the momenta [7, 8, (9, 10]. Moreover, third and higher order integrals of motion are not related to the separation of variables, at least in configuration space, in the case of purely scalar potentials either [9, 10].

Variable separation in the presence of magnetic fields has also been investigated [1, 22, [23] and turns out to be quite rare. Separable systems in this case only constitute a subset of the quadratically integrable ones.

Natural questions that arise, specially in the context of quantum mechanics, are the following. What does one do with integrals of motion that do not lead to the separation of variables? How do they help to integrate the Schrödinger equation and find the energy spectrum?

The purpose of this article is to provide at least a partial answer to these questions.
The problem is formulated mathematically in Section 2. Section 3 is devoted to systems with one first order operator X, commuting with the Hamiltonian H. In Section 4 the commuting operator X is assumed to be a second order operator of a specific ("cartesian") type. We introduce the concept of quasiseparation of variables and identify all cases when quasiseparation occurs. The Schrödinger equation is solved for a specific scalar and vector potential in Section 5. Section 6 is devoted to conclusions.

## 2 General setting

The quantum Hamiltonian that we are considering is

$$
\begin{equation*}
H=\frac{\sim^{2}}{2}\left(@_{x}^{2}+\varrho_{y}^{2}\right) \quad \frac{i \sim}{2}\left(A \varrho_{x}+@_{x} A+B \varrho_{y}+@_{y} B\right)+V ; \tag{2.1}
\end{equation*}
$$

where $\mathrm{A}, \mathrm{B}$ and V are functions of the coordinates $\mathrm{x}, \mathrm{y}$. The quantities of direct physical importance are the magnetic field and effective potential W :

$$
\begin{equation*}
=A_{y} \quad B_{x} ; W=V \quad \frac{1}{2}\left(A^{2}+B^{2}\right): \tag{2.2}
\end{equation*}
$$

These quantities are gauge invariant, i.e. unchanged by the transformation

$$
\begin{align*}
& \mathrm{V}!\mathbf{V}=\mathrm{V}+(\mathbf{A} ; \mathrm{r})+\frac{1}{2}(\mathrm{r})^{2} ; \\
& \mathbf{A}!\mathbf{A}=\mathbf{A}+\mathrm{r} ; \mathbf{A}=(\mathrm{A} ; \mathrm{B}) ; \tag{2.3}
\end{align*}
$$

where ( $\mathrm{x}, \mathrm{y}$ ) is an arbitrary smooth function.
The classical equations of motion are

$$
\begin{equation*}
\mathrm{x}=\mathrm{y} \mathrm{~W}_{\mathrm{x}} ; \mathrm{y}=\underline{\mathrm{x}} \mathrm{~W}_{\mathrm{y}} \text {; } \tag{2.4}
\end{equation*}
$$

so all we need to know is and W (the dots indicate time derivatives). In quantum mechanics we need the Hamiltonian (2.1). Hence, given and W, we must still choose a gauge, i.e. the function in eq. (2.3), and calculate A, B and V.

The quantities and W are obtained from the commutativity condition

$$
\begin{equation*}
\mathrm{X} ; \mathrm{H}]=0 \text {; } \tag{2.5}
\end{equation*}
$$

where X is the integral of motion, i.e. either a first, or a second order linear differential operator. The integral X is obtained from the same condition.

The two equations to solve simultaneously, once a gauge is chosen, are

$$
\begin{equation*}
\mathrm{H}=\mathrm{E} ; \mathrm{X}=\text {; } \tag{2.6}
\end{equation*}
$$

and the vector potential (i.e the gauge) should be chosen so as to simplify this pair.

## 3 First order integrals

A first order integral of motion will have the form [2]

$$
\begin{equation*}
x=\left(L_{3}+y A \quad x B\right)+\left(P_{1}+A\right)+\left(P_{2}+B\right)+m ; \tag{3.1}
\end{equation*}
$$

where $L_{3}, P_{1}$ and $P_{2}$ are the angular and linear momentum operators, i.e.

$$
\begin{equation*}
L_{3}=\quad \mathrm{i} \sim\left(y @_{x} \quad x @_{y}\right) ; P_{1}=\quad \mathrm{i} \sim @_{x} ; P_{2}=\quad \mathrm{i} \sim @_{y} ; \tag{3.2}
\end{equation*}
$$

and are constants and the functions $\mathrm{m}(\mathrm{x}, \mathrm{y})$, and W satisfy

$$
\begin{align*}
&(x \quad)+m_{x}=0 ;(y+)+m_{y}=0 ;  \tag{3.3}\\
&(y+) W_{x}+(x+) W_{y}=0:
\end{align*}
$$

Two inequivalent possibilities occur. For 0 we can put $=1$ and translate and into $=0$. For $=0,{ }^{2}+{ }^{2} \not 0$ we can rotate into $=0$ and normalize to $=1$. Let us now look at the two cases separately and solve the Schrödinger equation in each case.
a) $=0,=0,=1$

We have [2]

$$
\begin{equation*}
\mathrm{m}=\mathrm{m}(\mathrm{x}) ; \mathrm{W}=\mathrm{W}(\mathrm{x}) ; \quad=\quad(\mathrm{x})=\underline{\mathrm{m}}(\mathrm{x}): \tag{3.4}
\end{equation*}
$$

The integral of motion (3.1) in this case reduces to

$$
\begin{equation*}
x=P_{2}+m(x)+B(x ; y): \tag{3.5}
\end{equation*}
$$

A convenient choice of gauge is

$$
\begin{equation*}
B=m(x) ; A=0 ; \tag{3.6}
\end{equation*}
$$

and from (2.2) we obtain

$$
\begin{equation*}
=\underline{m}(x) ; V=W(x)+\frac{1}{2} m(x)^{2}: \tag{3.7}
\end{equation*}
$$

The system (2.6) reduces to

$$
\begin{gather*}
\mathrm{f} \frac{\sim^{2}}{2}\left(@_{\mathrm{x}}^{2}+@_{\mathrm{y}}^{2}\right)+\mathrm{i} \sim \mathrm{~m}(\mathrm{x}) @_{\mathrm{y}}+\mathrm{W}(\mathrm{x})+\frac{1}{2} \mathrm{~m}(\mathrm{x})^{2} \mathrm{~g}=\mathrm{E} ; \\
\mathrm{i} \sim @_{\mathrm{y}}=\mathrm{k}: \tag{3.8}
\end{gather*}
$$

With this choice of gauge we have the separation of variables, i.e.

$$
\begin{gather*}
(x ; y)=f_{E k}(x) e^{\frac{i k}{\sim} y} ;  \tag{3.9}\\
\frac{\tilde{n}^{2}}{2} \frac{d^{2} f}{d x^{2}}+\left[\frac{k^{2}}{2}+k m+W+\frac{1}{2} m^{2} \quad E\right] f=0: \tag{3.10}
\end{gather*}
$$

Equation (3.10) is exactly solvable for many choices of $m(x)$ (i.e. for many choices of the magnetic field ) and the scalar potential $\mathrm{V}(\mathrm{x})$. For instance, if we have

$$
\begin{equation*}
m=!^{2} x^{2} ; \quad=2!^{2} x ; v(x)=0 ; \tag{3.11}
\end{equation*}
$$

eq. (3.10) has the solution

$$
\begin{equation*}
\mathrm{f}=\mathrm{e}^{\frac{2_{\mathrm{x}^{2}}^{2}}{2}} \mathrm{H}_{\mathrm{n}}(\mathrm{x}) ; \quad=\frac{\mathrm{r}}{\frac{!}{\sim}}(2 \mathrm{k})^{1=4} ; \mathrm{E}=\frac{\mathrm{k}^{2}}{2}+(2 \mathrm{n}+1)^{\sim} \frac{\mathrm{p}}{2} \overline{2 \mathrm{k}} ; \tag{3.12}
\end{equation*}
$$

where $H_{n}()$ is a Hermite polynomial. In this case $f(x)$ is regular and square integrable, however the solution (3.9) involves a plane wave in y .
b) $=1, \quad==0$

In this case the determining equations (3.3) imply [2]

$$
\begin{equation*}
\mathrm{m}=\mathrm{m}(\mathrm{r}) ; \mathrm{W}=\mathrm{W}(\mathrm{r}) ; \quad(\mathrm{r})=\frac{\mathrm{m}}{\mathrm{r}} ; \tag{3.13}
\end{equation*}
$$

where we are using polar coordinates

$$
\begin{equation*}
x=r \cos ; y=r s i n: \tag{3.14}
\end{equation*}
$$

The operator (3.1) in this case is

$$
\begin{equation*}
\mathrm{x}=\mathrm{L}_{3}+\mathrm{yA} \quad \mathrm{xB}+\mathrm{m} ; \tag{3.15}
\end{equation*}
$$

and a good choice of gauge is given by

$$
\begin{equation*}
y A \quad x B+m=0 ; \tag{3.16}
\end{equation*}
$$

leading to

$$
\begin{gather*}
A(r ;)=\frac{m(r)}{r} \sin ; B(r ;)=\frac{m(r)}{r} \cos ;  \tag{3.17}\\
V(r ;)=W(r)+\frac{m^{2}}{2 r^{2}}: \tag{3.18}
\end{gather*}
$$

The solution of the system (2.6) can be written in separated forms as

$$
\begin{equation*}
(r ;)=e^{i M} \frac{1}{P_{r}^{\prime}} R_{E ; M}(r) ; \tag{3.19}
\end{equation*}
$$

with $R(r)$ satisfying

$$
\begin{equation*}
\frac{\sim^{2}}{2} \frac{d^{2} R}{d r^{2}}+f W(r)+\frac{1}{r^{2}} \frac{\sim^{2} M^{2}}{2}+\frac{m(r)^{2}}{2} \sim m(r) M \quad \frac{\sim^{2}}{8} \lg R=E R: \tag{3.20}
\end{equation*}
$$

Again, this equation is exactly solvable in special cases, e.g.

$$
\begin{equation*}
m(r)=\frac{-}{r} ; W=\frac{2}{2 r^{4}}: \tag{3.21}
\end{equation*}
$$

The conclusion from this section is that first order integrability in a magnetic field leads to a separation of variables either in cartesian, or in polar coordinates. To make this happen, a proper choice of gauge is crucial. Indeed, in a previous article [2] a different choice of gauge was made, leading to R -separation, rather than ordinary separation. The separated ordinary differential equations (3.10) and (3.20) both have the form of onedimensional Schrödinger equations. The magnetic field and the effective potential combine together into an x -dependent, or respectively r -dependent one-dimensional "potential".

## 4 Second order Cartesian integrability and the quasiseparation of variables

Let us now consider a Hamiltonian of the form (2.1), admitting one second order integral of motion X. It has been shown that this operator X (or function in classical mechanics) can be transformed into one of four standard forms [2,3]. They were called Cartesian, polar, parabolic and elliptic, because in the absence of a magnetic field, their existence leads to the separation of variables in Cartesian, polar, parabolic or elliptic coordinates, respectively [6, 20]. The direct relation to the separation of variables in the Schrödinger, or Hamilton-Jacobi equation does not hold in the presence of a magnetic field, but we keep the terminology. In this article we restrict ourselves to the Cartesian case.

The "Cartesian" integral of motion has the form [2, 3]

$$
\begin{gather*}
x=\frac{\sim^{2}}{2} @_{x}^{2} \quad i \sim\left[\left(A+k_{1}\right) @_{x}+k_{2} @_{y}\right] \quad \frac{i \sim}{2}\left(A_{x}+k_{1 x}+k_{2 y}\right)+\frac{1}{2} A^{2}  \tag{4.1}\\
+m+k_{1} A+k_{2} B:
\end{gather*}
$$

All functions involved in the Hamiltonian (2.1) and the integral (4.1) can be expressed in terms of two functions of one variable each, $f=f(x)$ and $g=g(y)$, satisfying

$$
\begin{equation*}
f=f^{2}+f+; g^{\infty}=g^{2}+g+; \tag{4.2}
\end{equation*}
$$

where , , and are real constants. We shall also use the first integrals of eq. (4.2), namely

$$
\begin{gather*}
f^{2}=P_{3}(f) ; \quad g^{0_{2}}=Q_{3}(g)  \tag{4.3}\\
P_{3}(f)=\frac{2}{3} f^{3}+f^{2}+2 f+\quad Q_{3}(g)=\frac{2}{3} g^{3}+g^{2}+2 g+{ }_{2}
\end{gather*}
$$

where $1_{1}$ and ${ }_{2}$ are further real constants. The dots and primes are x and y derivatives, respectively.

Eq. (4.2) and (4.3) can be solved in terms of elliptic functions, or their degeneracies, if the polynomials $P_{3}(f)$, or $Q_{3}(g)$ have multiple roots. In terms of $f(x)$ and $g(y)$ we have

$$
\begin{aligned}
& =f(x)+g^{\infty}(y) ;
\end{aligned}
$$

$$
\begin{align*}
& \mathrm{k}_{1}=\mathrm{g}^{0}(\mathrm{y}) ; \mathrm{k}_{2}=\mathrm{f}(\mathrm{x}) ;  \tag{4.4}\\
& m=\frac{\overline{3}}{}\left(g^{3}+2 f^{3} \quad 3 g f^{2}\right)+\left(f g \quad f^{2}\right) \quad \overline{2}\left(f^{2} \quad g^{2}\right) \\
& (2 f \quad g)+f+g:
\end{align*}
$$

where , figuring in the effective potential W and in m is an additional constant. The results (4.2) and (4.4) were obtained in classical mechanics [3], but the classical and quantum results coincide in the case of Cartesian integrability [2].

The vector potential $(A, B)$ is yet to be chosen, but must satisfy

$$
\begin{equation*}
A_{y} \quad B_{x}==f(x)+g^{\infty}(y): \tag{4.5}
\end{equation*}
$$

We shall in this section assume $f^{2}+g^{\infty} \in 0$.
Thus, we have a Hamiltonian $H$ and first integral $X$ satisfying (2.1) and (4.1), respectively, expressed in terms of quantities satisfying eq. (4.4). In general, variables do not separate in eq. (2.6) in any system of coordinates.

Let us introduce the concept of "quasiseparation of variables". We take a linear combination of the two equations (2.6), namely

$$
\begin{equation*}
\mathrm{f}(\mathrm{H} \quad \mathrm{E})+(\mathrm{x} ; \mathrm{Y})(\mathrm{X} \quad) \mathrm{g}=0 \tag{4.6}
\end{equation*}
$$

where $(x ; y)$ is a function to be determined. We wish to choose the function ( $x ; y$ ) in such a manner that eq. (4.6) allows separation in Cartesian coordinates. The solutions of eq. (4.6) will then have the separated form

$$
\begin{equation*}
E(x ; y)=V_{E}(x) W_{E}(y): \tag{4.7}
\end{equation*}
$$

The solution of the Schrödinger equation will be a superposition of separated solutions:
Z

$$
\begin{equation*}
E(x ; y)=A_{E} \quad V_{E}(x) w_{E} \quad(y) d \quad() \tag{4.8}
\end{equation*}
$$

where ( ) is some measure to be chosen and $A_{E}$ is independent of $x$ and y. For bound states the integral in eq. (4.8) will reduce to a sum.

On a more formal level we introduce the following definition.
Definition 1. The commuting pair of operators $\mathrm{fH} ; \mathrm{Xg}$ allows the quasiseparation of variables in the system (2.6) if there exists a function ( $\mathrm{x} ; \mathrm{y}$ ) such that eq. (4.6) allows the separation of variables in the sense of eq. 4.7).

In this article we are considering the case when ( $\mathrm{x}, \mathrm{y}$ ) are Cartesian coordinates in a plane, but the concept of quasiseparation is easily generalized to other coordinates and other spaces.

Substituting (4.7) into (4.6) we obtain the equation

$$
\begin{equation*}
\frac{\tilde{2}^{2}}{2} \mathrm{vw}{ }^{\infty}+1 \mathrm{vw}+2 \underline{\mathrm{Vw}}+3 \mathrm{Vw}^{0}+4 \mathrm{Vw}=0 \tag{4.9}
\end{equation*}
$$

with

$$
\begin{equation*}
1=\frac{\sim^{2}}{2}(1+) ; \quad 2=i \sim A(1+)+i \sim g^{0} ; \quad 3=i \sim(B \quad f) ; \tag{4.10}
\end{equation*}
$$

$$
\begin{array}{r}
4=W+\frac{1}{2} A^{2}(1+)+\frac{1}{2} B^{2}+\left(m \quad g^{0} A \quad f B\right)  \tag{4.11}\\
\frac{i \sim}{2}\left((1+) A_{x}+B_{y}\right) \quad E \quad:
\end{array}
$$

The necessary and sufficient condition for variables to separate in eq. (4.9) is that we have

$$
\begin{align*}
\frac{1}{4} & =\frac{V_{1}(x)}{V(x)+W^{\sim}(y)} & \frac{2}{4} & =\frac{V_{2}(x)}{V(x)+W^{\sim}(y)}  \tag{4.12}\\
\frac{\sim^{2}}{2_{4}} & =\frac{W_{1}(y)}{V(x)+W^{\sim}(y)} & \frac{3}{4} & =\frac{W_{2}(y)}{V(x)+W^{\sim}(y)}
\end{align*}
$$

where $V_{i}, W i, V$ and $W$ are some functions.
Let us consider the choice $(x ; y)=1$ separately.

## $4.1 \quad(\mathrm{x} ; \mathrm{y})=1$

With this particular choice, eq. (4.9) simplifies, $\mathrm{V}_{2}(\mathrm{x})$ reduces to a constant, and we find that

$$
\begin{equation*}
B(x ; y)=f+\frac{W_{2}(y)}{V_{2}} g^{0} ; \quad \text { and } \quad W_{1}(y)=\frac{\sim}{2 i} \frac{V_{2}}{g^{0}}: \tag{4.13}
\end{equation*}
$$

Condition (4.5) becomes

$$
\begin{equation*}
A(x ; y)=g^{0}+\quad(x) ; \tag{4.14}
\end{equation*}
$$

where $(x)$ is arbitrary, and eqs. 4.12) reduce to

$$
\begin{equation*}
\frac{g^{0}}{4}=\frac{V_{2}}{i \sim\left(\sim(x)+W^{\sim}(y)\right)}: \tag{4.15}
\end{equation*}
$$

Thus

$$
\begin{equation*}
\frac{@^{2}}{@ x @ y}\left(\frac{4}{g^{0}}\right)=0 \tag{4.16}
\end{equation*}
$$

is a necessary and sufficient condition for quasiseparation. A straightforward calculation shows that this condition only depends on $g(y)$ and is equivalent to

$$
\begin{equation*}
g^{\infty_{2}} \quad g^{0} g^{\infty 0}=0: \tag{4.17}
\end{equation*}
$$

The general solution of eq. (4.17) is $g(y)=C_{1} e^{C_{2} Y}+C_{3}$ and a two parameter class of particular solutions is $g(y)=g_{1} y+g_{0}$. It follows that $(x ; y)=1$ only allows quasiseparation in the cases $=\quad=\quad=0$ and $=0, \quad>0$ (i.e. $g(y)=\operatorname{qe}^{\mathrm{P}} \mathrm{y}+$ $\left.g_{2} e^{p-} y_{+}-\right)$with $g_{1} g_{2}=0$.

## $4.2(\mathrm{x} ; \mathrm{y}) \not 1$

Eliminating ${ }_{4}$ from the equations (4.12) and using relations (4.10) and (4.11) we obtain

$$
\begin{align*}
& A(x ; y)=(x)+\frac{(x ; y)}{1+(x ; y)} g^{0}(y) ; B(x ; y)=(y)+(x ; y) f(x) ;  \tag{4.18}\\
& 1+(x ; y)=\frac{1_{1}^{p} \overline{c_{1} \quad 2 k f(x)}}{c^{s}} \overline{c_{2}+2 k g(y)} \frac{g^{0}(y)^{2}}{f(x)^{2}} ; \\
& V_{1}(x)=\int_{1} \frac{\overline{C_{1}} 2 k f(x)}{f(x)^{2}} ; \quad W_{1}(y)=2 \frac{s}{\frac{c_{2}+2 k g(y)}{g^{0}(y)^{2}}}  \tag{4.19}\\
& V_{2}(x)=\frac{2 i}{\sim}(x) V_{1}(x) ; \quad W_{2}(y)=\frac{2 i}{\sim}(y) W_{1}(y):
\end{align*}
$$

The functions (x) and (y) are arbitrary and can be modified by gauge transformations (for instance they can be set equal to zero). The entries $c_{1}, c_{2}, k, 1$ and 2 are constants with ${ }_{1}^{2}={ }_{2}^{2}=1$.

The conditions (4.18) on A, B and are necessary for separation of variables in eq. (4.9). There is a further necessary condition that together with (4.18) is sufficient, namely

$$
\begin{equation*}
\mathrm{W}_{1}(\mathrm{y}){ }_{4}(\mathrm{x} ; \mathrm{y})=\mathrm{X}(\mathrm{x})+\mathrm{Y}(\mathrm{y}) ; \tag{4.20}
\end{equation*}
$$

where $X(x)$ and $Y(y)$ are arbitrary functions.
In other words we must determine the conditions on the functions $\mathrm{f}(\mathrm{x}), \mathrm{g}(\mathrm{y}), \quad(\mathrm{x})$, $(y)$ and the constants $k, q_{1}, c_{2}, \quad 1,2$ in such a manner that eq. (4.20) is satisfied. All of the above quantities are real and the square roots ${ }^{\mathrm{P}} \overline{\mathrm{C}_{1}} \quad 2 \mathrm{kf}$ and ${ }^{\mathrm{P}} \overline{\mathrm{C}_{2}+2 \mathrm{~kg}}$ must be simultaneously real, or simultaneously imaginary.

To proceed further we use (4.11), (4.18) and (4.19) to obtain

$$
\begin{equation*}
W_{1}(y){ }_{4}(x ; y)=R(x)+S(y)+T(x ; y) \tag{4.21}
\end{equation*}
$$

$R(x)=$

$$
\begin{equation*}
\frac{\mathrm{C}_{2} \mathrm{f}^{2}(\mathrm{x})+\left(\mathrm{C}_{1} \quad 2 \mathrm{kf}(\mathrm{x})\right)\left(2 \quad 21_{1}+2 \quad 2 \mathrm{f}(\mathrm{x})+\mathrm{f}^{2}(\mathrm{x}) \quad{ }^{2}(\mathrm{x})+\mathrm{i} \sim(\mathrm{x})\right)}{2_{1}^{\mathrm{p}} \frac{\mathrm{C}}{\mathrm{C}_{1} 2 \mathrm{kf}(\mathrm{x})} \mathrm{f(x)}^{2}} \tag{4.22}
\end{equation*}
$$

$$
\begin{align*}
& S(y)= \\
& \frac{\mathrm{c}_{1} \mathrm{~g}^{0}(\mathrm{y})+\left(\mathrm{c}_{2}+2 \mathrm{~kg}(\mathrm{y})\right)\left(2 \quad 2 \mathrm{p}+\mathrm{r}_{1} \quad 2{ }_{2}+2 \mathrm{~g}(\mathrm{y})+\mathrm{g}^{2}(\mathrm{y}) \quad{ }^{2}(\mathrm{y})+\mathrm{i} \sim^{0}(\mathrm{y})\right)}{2 \mathrm{c}_{2}+2 \mathrm{~kg}(\mathrm{y})} \overline{\mathrm{g}^{0}(\mathrm{y})^{2}} \tag{4.23}
\end{align*}
$$

and

$$
\begin{align*}
& T(x ; y)=p \frac{F_{1}(x) g(y)}{C_{1} 2 k f(x)}+p \frac{f(x) G_{1}(y)}{C_{2}+2 k g(y)} \\
& +i \sim \mathbb{F}_{2}(x) g^{0}(y) \quad \frac{c_{2}+2 k g(y)}{g^{0}(y)^{2}}+G_{2}(y) f(x) \quad \overline{c_{1} \quad 2 k f(x)}\left[\begin{array}{l}
f(x)^{2} \\
\end{array}\right. \tag{4.24}
\end{align*}
$$

In (4.24) we have

$$
\begin{align*}
& F_{1}(x)=\frac{1\left[k f^{2}(x)+{ }_{q} \frac{\left.\left(c_{1} \quad 2 k f(x)\right) f(x)\right]}{f(x)^{2}} ; ~\right.}{\text { in }}  \tag{4.25}\\
& F_{2}(x)=\frac{\left.2 k f^{2}(x)+\left(c_{1} \quad 2 k f(x)\right) f(x)\right]}{2\left(c_{1} \quad 2 k f(x)\right) f(x)} ; \\
& G_{1}(y)=\frac{\left.2 \mathrm{~kg}^{02}(\mathrm{y})+{ }_{\mathrm{p}}\left(\mathrm{c}_{2}+2 \mathrm{~kg}(\mathrm{y})\right) \mathrm{g}^{00}(\mathrm{y})\right]}{\mathrm{g}^{0}(\mathrm{y})^{2}} ; \\
& G_{2}(y)=\frac{\left.1 \mathrm{~kg}^{0}(\mathrm{y})\left(\mathrm{c}_{2}+2 \mathrm{~kg}(\mathrm{y})\right) \mathrm{g}^{\infty}(\mathrm{y})\right]}{2\left(\mathrm{c}_{2}+2 \mathrm{~kg}(\mathrm{y})\right) g^{0}(\mathrm{y})}:
\end{align*}
$$

The separability condition (4.20) is equivalent to the condition

$$
\begin{equation*}
\frac{@^{2} T}{@ x @ y}=0: \tag{4.26}
\end{equation*}
$$

We can consider the real and imaginary parts of eq. (4.26) separately. We obtain two conditions:

$$
\begin{align*}
& \frac{1}{f} \frac{F_{1}}{C_{1} 2 k f}:=\frac{1}{g^{0}} p \frac{G_{1}}{C_{2}+2 k g} \quad N_{1} \tag{4.27}
\end{align*}
$$

where $\mathrm{N}_{1}$ and $\mathrm{N}_{2}$ are constants.
More explicitly, eq. (4.27) and (4.28) can be rewritten as

$$
\begin{gather*}
\frac{\left.1 k^{2} f^{4}+2 k\left(c_{1} \quad 2 k f\right) £^{2} f+\left(C_{1} \quad 2 k f\right)^{2}\left(f^{2} \quad £ \dddot{f}\right)\right]}{\left(C_{1} \quad 2 k f\right)^{3=2}\left(£^{2}\right)^{3=2}}=N_{1}  \tag{4.29a}\\
\frac{\left.2 k^{2} g^{0} \quad 2 k\left(c_{2}+2 k g\right) g^{0} g^{\infty}+\left(c_{2}+2 k g\right)^{2}\left(g^{\infty} \quad g^{0} g^{\infty}\right)\right]}{\left(c_{2}+2 k g\right)^{3=2}\left(g^{0}\right)^{3=2}}=N_{1} \tag{4.29b}
\end{gather*}
$$

$$
\begin{gather*}
\frac{k_{2}\left[2 k^{2} f^{4}+k\left(c_{1} \quad 2 k f\right) f^{2} f \quad\left(c_{1} \quad 2 k f\right)^{2}\left(f^{2} \quad £ \dddot{f}\right)\right]}{2\left(c_{1} \quad 2 k f\right)^{3=2} f^{3}}=N_{2}  \tag{4.29c}\\
\frac{k_{1}\left[2 k^{2} g^{04} \quad k\left(c_{2}+2 k g\right) g^{02} g^{\infty}\left(c_{2}+2 k g\right)^{2}\left(g^{\infty} \quad g^{0} g^{\infty 0}\right)\right]}{2\left(c_{2}+2 k g\right)^{3=2} g^{03}}=N_{2} \tag{4.29d}
\end{gather*}
$$

We see that the functions $(x)$ and $(y)$ do not figure in 4.29), and hence have no influence on the separation of variables. The functions $f(x)$ and $g(y)$ depend on the constants , , , and of eq. (4.2) and on a total of four further integration constants. Our aim now is to find all values of these constants and of $k, c_{1}$ and $c_{2}$ for which eq. (4.29) are satisfied.

Let us consider the cases $k=0$ and $k \notin$ separately.
I) $k=0$

From (4.28) we have $\mathrm{N}_{2}=0$ and 4.29c(4.29d) are satisfied identically. Eq. 4.29ad.29b) simplify to

$$
\begin{equation*}
N_{1}={ }_{1}^{p} \overline{C_{1}} \frac{f^{2}+£ f}{\left(£^{2}\right)^{3=2}}={ }_{2}^{p} \overline{C_{2}} \frac{g^{\infty_{2}} g^{0} g^{\infty 0}}{\left(g^{0}\right)^{3=2}}: \tag{4.30}
\end{equation*}
$$

Using eq. (4.2) we obtain

$$
\begin{equation*}
3{ }_{1} N_{1} \mathrm{f}=2 \mathrm{p}{\overline{\mathrm{C}_{1}}}_{\mathrm{q}}^{\mathrm{f}^{2}} ; \quad 3{ }_{2} \mathrm{~N}_{1} g^{\infty}=2^{\mathrm{p}}{\overline{\mathrm{C}_{2}}}^{\mathrm{p}} \overline{\mathrm{~g}^{0}}: \tag{4.31}
\end{equation*}
$$

Eq. (4.31) are only compatible with (4.2) if we have $=N_{1}=0$. The assumptions $c_{1}=0$ or $c_{2}=0$ lead to contradictions or $(x ; y)=1$, so we are left with $f^{2} f(\dddot{f})=0$, $g^{\infty} g^{0}\left(g^{\infty 0}\right)=0$ and hence, using (4.2) again we find that the only solutions for $f(x)$ and $g(y)$ are

$$
\begin{align*}
& f(x)=f_{1} e^{p-x}+f_{2} e^{p-x}- \\
& g(y)=g_{1} e^{p-y}+g_{2} e^{p-} y_{y}-  \tag{4.32}\\
& \quad>0 ;>0 ; f_{1} f_{2}=g_{1} g_{2}=0 ;
\end{align*}
$$

where $f_{i}$ and $g_{i}$ are constants, or one of the functions $f(x)$ or $g(y)$ may be linear, the other being as in (4.32).
II) $k \notin 0$

We shall run through different possible solutions of eq. (4.2) and determine which of them are compatible with eq. (4.29).
$1)===0, \quad 0$.
We obtain

$$
\begin{equation*}
f(x)=\frac{1}{2} x^{2} \quad g(y)=\frac{1}{2} y^{2} \tag{4.33}
\end{equation*}
$$

Eq. (4.29) and the condition $\left(c_{2}+2 \mathrm{~kg}(\mathrm{y})\right)\left(\mathrm{c}_{1} \quad 2 \mathrm{kf}(\mathrm{x})\right)>0$ imply

$$
\begin{equation*}
c_{1}=c_{2}=N_{1}=N_{2}=0 ; \quad<0 \tag{4.34}
\end{equation*}
$$

2) $=0, \quad{ }^{2}+{ }^{2} \not 0$.

The functions $f(x)$ and $g(y)$ will be expressed in terms of exponentials, trigonometric functions, or one of them may have the form (4.33). In none of these cases can eq. (4.29) be satisfied.
3) $\not 0$.

In this case we are dealing with the two nonlinear equations (4.3). If the cubic polynomial on the right hand side has three distinct roots, we obtain solutions in terms of elliptic functions. Otherwise the solutions involve elementary functions.

Let us discuss the equation for $f(x)$. We can assume with no loss of generality that we have >0. Indeed, if we replace $\mathrm{f}(\mathrm{x})$ ! $\mathrm{f}(\mathrm{x})$, ! , ! , ! , 1 ! in eq. (4.3) we get the same equation. Hence we can change the sign of from negative to positive (if necessary). We write

$$
\begin{equation*}
f(x)^{2}=\frac{2}{3} \quad\left(f(x) \quad f_{1}\right)\left(f(x) \quad f_{2}\right)\left(f(x) \quad f_{3}\right) ; \quad>0 \tag{4.35}
\end{equation*}
$$

We require $f(x)$ to be real, hence $f(x)^{2}>0$. If all three roots are real we order them as $f_{1} \quad f_{2} \quad f_{3}$. Otherwise we consider $f_{1} 2 R$ and $f_{2}=p+$ iq, $f_{3}=p \quad$ iq, $p ; q 2 R, q>0$. The possibilities are:

$$
\begin{align*}
& \text { a) } f_{1}=f_{2}=f_{3}=\frac{7}{2} ; \quad f(x)=\frac{6}{2}+\frac{6}{\left(\mathrm{x} \mathrm{x}_{0}\right)^{2}}  \tag{4.36}\\
& \text { b) } f_{1}=f_{2}<f_{3}<f ; \quad f(x)=f_{1}+\frac{f_{3} f_{1}}{\sin ^{2}!\left(\begin{array}{ll}
x & x_{0}
\end{array}\right)} \text {; }  \tag{4.37}\\
& f_{1}=\frac{+2^{p} \overline{2} 4}{2} ; \quad!^{2}=\frac{p \frac{2}{2}}{4} ; \quad\left(f_{3} \quad f_{1}\right)=\frac{6!^{2}}{}
\end{align*}
$$

$$
\begin{align*}
& \text { d) } f_{1}<f_{2}=f_{3} \quad f ; \quad f(x)=f_{1}+\frac{f_{3} f_{1}}{\tanh ^{2}!\left(\begin{array}{ll}
x & x_{0}
\end{array}\right)} \text {; } \tag{4.39}
\end{align*}
$$

with $f_{1}, f_{3}$ and $!$ as in (4.38). In cases b,c and d we assume ${ }^{2} 4>0$.

$$
\begin{gather*}
\text { e) } \mathrm{f}_{1} \mathrm{f} \mathrm{f}_{2}<\mathrm{f}_{3} ; \mathrm{f}_{1}<\mathrm{f}_{2} \mathrm{f}(\mathrm{x})=\mathrm{f}_{1}+\left(\mathrm{f}_{2} \frac{\left.\mathrm{f}_{1}\right) \mathrm{sn}^{2}\left(!\left(\mathrm{x} \quad \mathrm{x}_{0}\right) ; \mathrm{k}\right) ;}{!^{2}=\frac{f_{2}}{6}\left(\mathrm{f}_{3} \quad \mathrm{f}_{1}\right) ;} \mathrm{k}=\frac{\mathrm{f}_{3} \mathrm{f}_{1}}{} ;\right. \tag{4.40}
\end{gather*}
$$

where $\mathrm{sn}(!\mathrm{x} ; \mathrm{k})$ is a Jacobi elliptic function.

$$
\begin{equation*}
\text { f) } \left.\left.\mathrm{f}_{1}<\mathrm{f}_{2}<\mathrm{f}_{3} \quad \mathrm{f} ; \quad \mathrm{f}(\mathrm{x})=\mathrm{f}_{1}+\frac{\mathrm{f}_{3} \mathrm{f}_{1}}{\mathrm{sn}^{2}(!(\mathrm{x}} \mathrm{x}_{0}\right) ; \mathrm{k}\right) \text {; } \tag{4.41}
\end{equation*}
$$

with k and ! as in (4.40).

$$
\text { g) } \begin{align*}
\mathrm{f}_{1} 2 \mathrm{R} ; & \mathrm{f}_{2 ; 3}=\mathrm{p}  \tag{4.42}\\
& \mathrm{r} \quad \text { iq; } \mathrm{q}>0 ; \quad \mathrm{f}(\mathrm{x})=\mathrm{f}_{1}+\mathrm{A} \frac{1 \mathrm{cn}(\mathrm{x} ; \mathrm{k})}{1+\mathrm{cn}(\mathrm{x} ; \mathrm{k})} ; \\
= & \frac{2}{3} \mathrm{~A} ; \quad \mathrm{k}^{2}=\frac{\mathrm{A} \mathrm{f}_{1}+\mathrm{p}}{2 \mathrm{~A}} ; \quad \mathrm{A}^{2}=\left(\begin{array}{ll}
\mathrm{p} & \left.\mathrm{f}_{1}\right)^{2}+\mathrm{q}^{2}
\end{array}\right.
\end{align*}
$$

The solutions for $g(y)$ are similar and can be obtained from those for $f(x)$ by the substitutions

$$
\begin{equation*}
\mathrm{f}(\mathrm{x})!\quad \mathrm{g}(\mathrm{y}) ; \quad \text { ! } \quad ; \quad!\quad ; \quad!\quad ; 1!\quad 2 \tag{4.43}
\end{equation*}
$$

The solutions for $f(x)$ and $g(y)$ can now be substituted into eq. (4.29) in order to determine whether there exist constants $\mathrm{c}_{1}, \mathrm{C}_{2}, \mathrm{k}$ and ${ }_{1}, \quad 2$ for which the quantities $\mathrm{N}_{1}$ and $N_{2}$ are indeed constant. It turns out that if $f(x)$ or $g(y)$ are given by elliptic functions, eq. (4.29) are never satisfied. However, if both polynomials in eq. (4.3) have multiple roots, eq. (4.29) can always be satisfied. We give the results for $f(x)$ and $g(y)$ in Tables 1 and 2 , respectively. The calculations are quite cumbersome and were performed using Mathematica.

From the tables, we see that any $f(x)$ from Table 1 can be combined with any $g(y)$ from Table 2. The fact that $\mathrm{N}_{2}$ must be the same in both tables provides a relationship between 1 and 2 .

More specifically, we have:

$$
\begin{align*}
& { }_{1}=2 \text { for }\left(F_{1} ; G_{3}\right) ;\left(\mathbb{F}_{2} ; G_{3}\right) ;\left(\mathbb{F}_{3} ; G_{1}\right) ;\left(\mathbb{F}_{3} ; G_{2}\right) \text {; }  \tag{4.44}\\
& \left(\mathrm{F}_{3} ; \mathrm{G}_{4}\right) ;\left(\mathrm{F}_{4} ; \mathrm{G}_{3}\right) \\
& 1=2 \text { for }\left(\mathbb{F}_{1} ; G_{1}\right) ;\left(\mathbb{F}_{1} ; G_{2}\right) ;\left(\mathbb{F}_{1} ; G_{4}\right) ;\left(\mathbb{F}_{2} ; G_{1}\right) ;\left(\mathbb{F}_{2} ; G_{2}\right) ;  \tag{4.45}\\
& \left(\mathbb{F}_{2} ; \mathrm{G}_{4}\right) ;\left(\mathbb{F}_{3} ; \mathrm{G}_{3}\right) ;\left(\mathbb{F}_{4} ; \mathrm{G}_{1}\right) ;\left(\mathbb{F}_{4} ; \mathrm{G}_{2}\right) ;\left(\mathbb{F}_{4} ; \mathrm{G}_{4}\right)
\end{align*}
$$

Similar tables are easily obtained for < 0 and we shall not present them here. We see that for $\in 0$ we must have $k \notin\left(k=0\right.$ would imply $\left.c_{1}=c_{2}=0\right)$. Otherwise, $k$ remains arbitrary, as do $;::: ;$ in eq. (4.2) and (4.3). The integration constants 1 and ${ }_{2}$ must be such that the polynomials $\mathrm{P}_{3}(f)$ and $\mathrm{Q}_{3}(\mathrm{~g})$ in eq. (4.3) have multiple roots. The constants $c_{1}$ and $c_{2}$ are completely determined.

Let us sum up our results as a theorem.
Theorem 1. Separation of variables in eq. (4.6) for $\mathrm{f}^{2}+\mathrm{g}^{\infty} \leqslant 0$ occurs if and only if we have one of the following

1. $===0$.

In this case we have $\mathrm{g}(\mathrm{y})=g_{0} \mathrm{Y}+\mathrm{g}_{1}$ and $\mathrm{f}(\mathrm{x})$ is any solution of eq. (4.2) with $=0$.
We can put $=1, \mathrm{~A}=\mathrm{g}^{\circ}$ and $\mathrm{B}=\mathrm{f}$.
2. $=0, \quad>p \underline{0}$,
$g(y)=g_{1} e^{p-,}+g_{2} e^{p-}{ }_{y}-, \quad g_{1} g_{2}=0$
and $\mathrm{f}(\mathrm{x})$ is any solution of eq. (4.2) with $=0$.
We can put $=1, \mathrm{~A}=9^{\circ}$ and $\mathrm{B}=\mathrm{f}$.
$3 .===0, \quad<0, \Phi=c_{2}=0, k \notin 0, \quad=^{q}-$.
In this case we have $\mathrm{f}(\mathrm{x})=\frac{1}{2} \mathrm{x}^{2}, \quad \mathrm{~g}(\mathrm{y})=\frac{1}{2} \mathrm{y}^{2}$
and we can put $\mathrm{A}=\overline{1+}^{0}$ and $\mathrm{B}=\mathrm{f}$.
4. $\in 0, \mathrm{k} \in \mathrm{O}, \mathrm{f}(\mathrm{x})$ and $\mathrm{g}(\mathrm{y})$ are solutions of eq. (4.2) as listed in Table 1 and Table 2, respectively, and , A and B as in eq. (4.18) where we can put $=1$. The values of the constants $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ are listed in the tables and $1_{1}$ and 2 are related as in eq. (4.44) or 4.45).

The formulas for the vector potential (A;B) can be modified by putting A! A + ( x ), B ! $\mathrm{B}+(\mathrm{y})$ without any effect on solutions.

## 5 Example of solving the Schrödinger equation by quasiseparation of variables

In order to show how quasiseparation of variables allows us to solve the Schrödinger equation, let us consider the simplest case, namely (4.33). We have $f(x)=\frac{x^{2}}{2}, g(y)=\frac{y^{2}}{2}$ and hence

$$
\begin{equation*}
=0=+; W=\frac{1}{2}(+)\left(x^{2} \quad y^{2}\right) ;<0 \tag{5.1}
\end{equation*}
$$

Changing the notation of the constants, we put

$$
\begin{equation*}
\mathrm{W}=\frac{1}{2}\left(!{ }_{1}^{2} x^{2}+!{ }_{2}^{2} y^{2}\right) ;=0 ;!_{1} \in!_{2} ; \tag{5.2}
\end{equation*}
$$

In eq. (4.18) we choose $(x)=(y)=0$ and obtain

$$
\begin{equation*}
A=\frac{!_{2} 0}{!_{1}+!_{2}} y ; B=\frac{!_{1} 0}{!_{1}+!_{2}} x ; \quad(x ; y)=\frac{!_{2}!_{1}}{!_{1}}: \tag{5.3}
\end{equation*}
$$

In terms of the constant magnetic field 0 and the frequencies $!_{1}$ and $!_{2}$ the Hamiltonian H and integral X reduce to

$$
\begin{align*}
& \mathrm{H}=\frac{\sim^{2}}{2}\left(@_{\mathrm{x}}^{2}+\mathrm{@}_{\mathrm{y}}^{2}\right) \quad \mathrm{i} \sim \frac{0}{!_{1}+!_{2}}\left(!_{2} \mathrm{y@}_{\mathrm{x}} \quad!_{1} \mathrm{x} @_{\mathrm{y}}\right)+  \tag{5.4}\\
& \frac{1}{2} \frac{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}{\left(!_{1}+!_{2}\right)^{2}}\left(!_{1}^{2} x^{2}+!_{2}^{2} y^{2}\right) ; \\
& \mathrm{X}=\frac{\sim^{2}}{2} @_{\mathrm{x}}^{2} \quad \mathrm{i} \sim \frac{0!_{1}}{!_{1}^{2}!_{2}^{2}}\left(!_{2} \mathrm{y} @_{\mathrm{x}} \quad!_{1} \mathrm{x} @_{\mathrm{y}}\right)+\frac{1}{2}!_{1}^{2} \frac{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}{\left(!_{1}+!_{2}\right)^{2}} \mathrm{x}^{2}: \tag{5.5}
\end{align*}
$$

The linear combination (4.6) of H and X that allows the separation of variables is in this case

$$
\begin{gather*}
\mathrm{f} \frac{\sim^{2}}{2}\left[\frac{!_{2}}{!_{1}} @_{\mathrm{x}}^{2}+@_{y}^{2}\right]+\frac{1}{2\left(!_{1}+!_{2}\right)^{2}}\left[\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}\right]\left(!_{1}!_{2} x^{2}+!_{2}^{2} y^{2}\right) g= \\
\text { (E } \left.\frac{!_{1}!_{2}}{!_{1}}\right): \tag{5.6}
\end{gather*}
$$

Putting

$$
\begin{equation*}
(\mathrm{x} ; \mathrm{y})=\mathrm{v}(\mathrm{x}) \mathrm{w}(\mathrm{y}) ; \tag{5.7}
\end{equation*}
$$

as in eq. (4.7) we obtain

$$
\begin{array}{r}
\frac{\sim^{2}}{2} \frac{!_{2}}{!_{1}} v_{\mathrm{xx}}+\frac{1}{2} \frac{!_{1}!_{2}}{\left(!_{1}+!_{2}\right)^{2}}\left[\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2} \mathrm{xx}^{2} \mathrm{v}+\frac{!_{1} \quad!_{2}}{!_{1}} \mathrm{v}=\mathrm{k}_{0} \mathrm{v} ;\right.  \tag{5.8}\\
\frac{\sim^{2}}{2} \mathrm{w}_{\mathrm{Yy}}+\frac{!_{2}^{2}}{2\left(!_{1}+!_{2}\right)^{2}}\left[\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}\right] \mathrm{y}^{2} \mathrm{w} \quad \mathrm{Ew}=\mathrm{k}_{0} \mathrm{w} ;
\end{array}
$$

where $\mathrm{k}_{0}$ is a separation constant and (E, ) are fixed constants. The solutions of eq. (5.8) are of course well known and the regular, square integrable solutions are given in terms of Hermite polynomials $\mathrm{H}_{\mathrm{n}}$ as

$$
\begin{equation*}
\mathrm{V}(\mathrm{x})=\mathrm{e}^{\frac{2_{1}^{2} x^{2}}{2}} H_{n_{1}}\left({ }_{1} \mathrm{X}\right) ; w(\mathrm{y})=e^{\frac{2^{2} y^{2}}{2}} H_{n_{2}}(2 Y): \tag{5.9}
\end{equation*}
$$

The constants satisfy

$$
\begin{equation*}
a=\frac{r}{\frac{!_{a}}{\sim\left(!_{1}+!_{2}\right)}}\left[\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}\right]^{1=4} ; \quad a=1 ; 2 ; \tag{5.10}
\end{equation*}
$$

$$
\begin{align*}
\mathrm{k}_{0}!_{1} \quad\left(!_{1} \quad!_{2}\right) & =\frac{\sim!_{1}!_{2}}{2\left(!_{1}+!_{2}\right)} \mathrm{q} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}\left(2 \mathrm{n}_{1}+1\right) \\
\mathrm{E} \quad \mathrm{k}_{0} & =\frac{\sim!_{2}}{2\left(!_{1}+!_{2}\right)} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}\left(2 \mathrm{n}_{2}+1\right) \tag{5.11}
\end{align*}
$$

$\mathrm{n}_{\mathrm{i}}=0,1,2, \ldots$
Eliminating $\mathrm{k}_{0}$ we have

$$
\begin{align*}
\mathrm{E}!_{1}+\left(!_{2} \quad!_{1}\right) & ={\frac{\sim!_{1}!_{2}}{!_{1}+!_{2}}}_{\mathrm{q}}^{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}(\mathrm{n}+1) \\
\mathrm{n} & =\mathrm{n}_{1}+\mathrm{n}_{2}: \tag{5.12}
\end{align*}
$$

The solution ( $\mathrm{x}, \mathrm{y}$ ) thus depends on two nonnegative integers $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$, whereas the constants E and depend only on n.

Let us now fix E and , i.e. fix $\mathrm{n}=\mathrm{n}_{1}+\mathrm{n}_{2}$ and write the solution of the Schrödinger equation with Hamiltonian (5.4) as a superposition of solutions of eq. (5.6):

$$
\begin{equation*}
E ;(x ; y)=e^{\frac{1}{2}\left(1_{1}^{2} x^{2}+{ }_{2}^{2} y^{2}\right) X^{n}} A_{n_{1}=0} A_{n_{1} ; n} n_{1} H_{n_{1}}\left({ }_{1} x\right) H_{n} n_{1}(2 Y) ; \tag{5.13}
\end{equation*}
$$

where the constants $A_{n_{1}, n} n_{1}$ are to be determined. We substitute (5.13) into the Schrödinger equation, use the recursion relations for the Hermite polynomials and obtain a linear homogeneous equation for the constants $A_{n_{1} ; n} n_{1}$. This equation is best written in matrix form involving a tridiagonal matrix

$$
\begin{equation*}
\mathrm{M} \text { 觡 }>=j 0>; \tag{5.14}
\end{equation*}
$$

i.e.

$$
\begin{align*}
& 11=R\left(!_{1}+(2 n+1)!_{2}\right) \quad E ; \quad 22=R\left(3!1_{1}+(2 n 1)!\right)_{2} \quad E ; \\
& n n=R\left((2 n \quad 1)!_{1}+3!{ }_{2}\right) \quad \underset{p}{E} ; \quad n+1 n+1=R\left((2 n+1)!_{1}+!{ }_{2}\right) \quad E ;  \tag{5.16}\\
& R=\frac{\sim^{p} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}}{2\left(!_{1}+!_{2}\right)} ; S=\frac{\mathrm{i} \sim 0}{!_{1}+!_{2}} \overline{!_{1}!_{2}} \text { : }
\end{align*}
$$

The energy is obtained from an algebraic equation of order $\mathrm{n}+1$, namely

$$
\begin{equation*}
\operatorname{det} M=0 \text { : } \tag{5.17}
\end{equation*}
$$

The constant , for E and n given, is obtained from eq. (5.12). The wave function for E and fixed has the form (5.13) with coefficients $A_{n_{1} n} n_{1}$ obtained by solving the system (5.15).

Thus, once eq. (5.6) is solved by separation of variables, the solution of the Schrödinger equation reduces to linear algebra. The energy operator is reduced to block diagonal form, with each block of finite dimension, namely $n+1$. In this scheme the problem is "exactly solvable".

For low values of $n$ this can be done explicitly. For the ground state we have:

$$
\begin{align*}
\mathrm{n}=0 \quad \mathrm{E} & =\frac{\sim}{2}^{\mathrm{q}} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}} ;=\frac{\sim!_{1}}{2\left(!_{1}+!_{2}\right)} \mathrm{q} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}} ;  \tag{5.18}\\
00 & =\mathrm{A}_{00} \mathrm{e} \frac{{\frac{2}{2} x^{2}+{ }_{2}^{2} y^{2}}_{2}^{2}}{} ;
\end{align*}
$$

The first two excited states satisfy

$$
\begin{align*}
& \mathrm{n}=1 \quad \mathrm{E}=\frac{\sim}{2}\left[\begin{array}{l}
\mathrm{q} \\
\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}
\end{array} \overline{\left(!_{1} \quad!_{2}\right)^{2}+{ }_{0}^{2}}\right] ; \\
& =\frac{\sim}{2\left(!{ }_{2}^{2} \quad!_{1}^{2}\right)}\left[2!_{1}^{2}{ }^{\mathrm{q}} \overline{\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}}\right.  \tag{5.19}\\
& \left.\left(!_{1}+!_{2}\right) \overline{\left(!_{1} \quad!_{2}\right)^{2}+{ }_{0}^{2}}\right] ; \\
& \left.=e^{\frac{2_{1}^{2} x^{2}+{ }_{2}^{2} y^{2}}{2}} \mathbb{A}_{01} H_{1}(2 Y)+A_{10} H_{1}(1 x)\right] ;
\end{align*}
$$

with

$$
\begin{equation*}
A_{10}=\frac{i}{20}\left[_{q}^{\left.\left(!_{1}+!_{2}\right)^{2}+{ }_{0}^{2}\left(!_{1}+3!_{2}\right) \quad q \overline{\left(!_{1}!_{2}\right)^{2}+{ }_{0}^{2}}\left(!_{1}+!_{2}\right)\right] A_{01}: ~}:\right. \tag{5.20}
\end{equation*}
$$

For $\mathrm{n}=2$ and $\mathrm{n}=3$ we must solve a cubic and quartic equation, respectively.

## 6 Conclusions

We have shown that in the presence of a magnetic field 0 the existence of a first order integral of motion leads to the separation of variables in the Schrödinger equation, once we make the proper choice of coordinates and gauge.

The existence of a second order integral does no longer imply the separation of variables. In many cases, identified in Theorem 1 of Section 4, we can "'quasiseparate" variables,
that is separate variables in one equation that is an appropriate linear combination of the two equations, $\mathrm{H}=\mathrm{E}$ and $\mathrm{X}=$. The solutions of the Schrödinger equation are then linear combinations of solutions of this equation, namely (4.6).

In Section 5 we analysed one of the separable cases in detail, namely that of a constant magnetic field 0 and an anisotropic harmonic oscillator effective potential W (see eq. (5.2)).

Thus quasiseparation of variables is reminescent of the Dirac equation [12. The same method can be used for all cases identified in Section 4.

The question that remains is the following: What can we do in those integrable cases when neither separation of variables, nor quasiseparation of variables occurs? The same questions arise in the case of polar integrability where the magnetic fields and effective potentials are known [2, 16], but the Schrödinger equation remains to be solved. Some examples of parabolic and elliptic integrability are known [17]; the solutions of the Schrödinger equation remain to be studied.

Finally, a few words about superintegrability [4, 5, 6, 9, 10, 11, 12, 14, 15, 16, 18, 19, [20, 21]. In two dimensions, superintegrability means that two independent operators, $\mathrm{X}_{1}$ and $\mathrm{X}_{2}$, commuting with H (but not with each other) exist. The only known case with a nonzero magnetic field that exists, is that of a constant magnetic field 0 and a zero effective scalar potential $W=0$. In this case there are three first order integrals and they generate a four-dimensional Lie algebra, isomorphic to a central extension of the Euclidean Lie algebra e(2) [2].

## Acknowledgements

The research of P.W. was partly supported by a research grant from NSERC of Canada. F.C. and C.H. benefitted from NSERC undergraduate student research awards.

## Table 1

Functions $f(x)$ leading to quasiseparation of variables. We have

$$
!_{1}^{2}=\frac{\mathrm{p} \frac{4}{2}}{4} ;^{2} \quad 4 \quad>0 ;>0 ; \mathrm{f}_{3} \quad \mathrm{f}_{1}=\frac{6!_{1}^{2}}{} ; \mathrm{N}_{1}=\frac{8{ }_{2} \mathrm{~N}_{2}}{\mathrm{k}_{1}}
$$

| No. | $\mathrm{f}(\mathrm{x})$ | $\mathrm{Cl}_{1}$ | $\mathrm{N}_{2}$ | Comment |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{F}_{1}$ | $\frac{6}{\left(x x_{0}\right)^{2}} \quad \overline{2}$ | $2 \mathrm{kf} \mathrm{f}_{1}$ | $2 \frac{\mathrm{k}}{2} \frac{\mathrm{k}}{3}$ | $\begin{array}{r} \mathrm{f}_{1}=\mathrm{f}_{2}=\mathrm{f}_{3} \quad \mathrm{f}(\mathrm{x}) \\ \mathrm{f}_{1}=\overline{2} \\ \hline \end{array}$ |
| $\mathrm{F}_{2}$ | $f_{1}+\frac{f_{3} f_{1}}{\sin ^{2}!1\left(x x_{0}\right)}$ | 2 kf | $2 \frac{k}{2} \overline{\frac{k}{3}}$ | $\begin{array}{r} \mathrm{f}_{1}=\mathrm{f}_{2}<\mathrm{f}_{3} \mathrm{P} \frac{\mathrm{f}(\mathrm{x})}{\mathrm{x}^{24}} \\ \mathrm{f}_{1}=\frac{2}{2} \end{array}$ |
| $\mathrm{F}_{3}$ | $\mathrm{f}_{1}+\left(\begin{array}{ll}\mathrm{f}_{3} & \mathrm{f}_{1}\end{array}\right) \tanh ^{2}!_{1}\left(\begin{array}{ll}\mathrm{x} & \mathrm{x}_{0}\end{array}\right)$ | 2 kf | $2 \frac{k}{2} \frac{k}{3}$ | $\begin{aligned} & \mathrm{f}_{1} \mathrm{f}(\mathrm{x}) \mathrm{f} \mathrm{f}_{2}=\mathrm{f}_{3} \\ & \mathrm{f}_{3}=\frac{+\frac{2}{2}}{2} \end{aligned}$ |
| $\mathrm{F}_{4}$ | $f_{1}+\frac{f_{3} f_{1}}{\tanh ^{2}!1\left(x x_{0}\right)}$ | 2 kf | $2 \frac{\mathrm{k}}{2} \quad \frac{\mathrm{k}}{3}$ | $\begin{array}{r} \mathrm{f}_{1}<\mathrm{f}_{2}=\mathrm{f}_{3} \mathrm{p} \frac{\mathrm{f}(\mathrm{x})}{} \\ \mathrm{f}_{3}=\frac{+\mathrm{t}}{2} \\ 2 \end{array}$ |

## Table 2

Functions $\mathrm{g}(\mathrm{y})$ leading to quasiseparation of variables. We have

$$
!_{2}^{2}=\frac{\mathrm{p} \frac{2}{{ }^{2}+4}}{4} ;^{2}+4>0 ;>0 ; g_{3} \quad g_{1}=\frac{6!_{2}^{2}}{;} \mathrm{N}_{1}=\frac{8{ }_{2} \mathrm{~N}_{2}}{\mathrm{k}_{1}}
$$

| No. | $\mathrm{g}(\mathrm{y})$ | $\mathrm{C}_{2}$ | $\mathrm{N}_{2}$ | Comment |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{G}_{1}$ | $\overline{2} \frac{6}{\left(y y_{0}\right)^{2}}$ | $2 \mathrm{~kg}_{3}$ | $1 \frac{\mathrm{k}}{2} \quad$ | $\begin{array}{r} g(y) \quad g_{1}=g_{2}=g_{3} \\ g_{3}=\frac{2}{2} \end{array}$ |
| $\mathrm{G}_{2}$ | $g_{3} \frac{g_{3} g_{1}}{\tanh ^{2}!2\left(y y_{0}\right)}$ | $2 \mathrm{~kg}_{3}$ | $1 \frac{k}{2} \overline{\bar{k}}$ | $\begin{array}{r} g(y) \quad g_{1}=g_{2}<g_{3} \\ g_{1}=\frac{p^{2}+4}{{ }^{2}+4} \end{array}$ |
| G 3 | $g_{3} \quad\left(\begin{array}{ll}3 & \left.g_{1}\right) \tanh ^{2}!_{2}\left(\begin{array}{ll}y & y_{0}\end{array}\right)\end{array}\right.$ | $2 \mathrm{~kg}_{3}$ | $\frac{k}{\frac{k}{2}}$ | $\begin{array}{r} g_{1}=g_{2} \frac{g(y) g_{3}}{\mathrm{P} \frac{g^{2}+4}{2}} \\ \quad g_{1}=\frac{2}{} \end{array}$ |
| $\mathrm{G}_{4}$ | $g_{3} \frac{g_{3} g_{1}}{\sin ^{2}!2(y)}$ | $2 \mathrm{~kg}_{1}$ | $1 \frac{k}{2} \quad \frac{k}{3}$ | $\begin{array}{r} g(y) \quad g_{1}<g_{2}=g_{3} \\ g_{3}=\frac{+{ }^{2}{ }^{2+4}}{2} \end{array}$ |
