

The Plight of 'I Am'

Joy Christian

Wolfson College, University of Oxford, Oxford OX2 6UD, United Kingdom

Once upon a time

.....there was a French soldier called Descartes.

One fine evening, as he was passing through a battle ground, he saw 'I am' sitting happily on the wall of sound metaphysics.

He gazed at it for a while, and | after a bit of thinking | proclaimed:

"I think, therefore I am (i.e., I exist)" (Discourse on Method, 1637).

'I am' smiled at him, easing itself into its comfortable classical seat on the tall wall.

Three hundred years went by. Empires declined and fell, and empires were born.

Yet, nothing really deterred 'I am' from its privileged pedestal.

Nothing, that is, that was as momentous as what was to happen.

Then, in 1900, Planck glimpsed the Quantum. Once refined by Heisenberg, Schrodinger, and Dirac, this Quantum led to the great fall of 'I am'. For a quantal 'I am' is merely a 'potential' (or indefinite) 'I am' and not necessarily an 'actual' (or definite) 'I am'.

Or it went tumbling down the wall of sound metaphysics, utterly bemused.

As luck would have it, a brave and mighty knight called Bohr was passing by, just in time to save it | so he thought. While still riding on his unflinching classical horse, he charged in with his cutting quantal sword and decreed:

"I am classical, therefore I am" (Copenhagen, 1935).

But, clearly, his decree did not have the right ring to it. For the classical could not be distilled from the quantal. This, in fact, was the very reason for the plight of 'I am'!

Yet, Bohr found many followers in his crusade to save 'I am' | all happy and content, if not complacent. And his decree might have been final, had it not been for the heretics like Einstein, Bohm, Wigner, and Everett.

With some help from his ingenious confederate von Neumann, Wigner sought to mend the weakness of Bohr's decree. He reached out deep into his own psyche and surmised:

"I am (conscious), therefore I am" (Princeton, 1961).

But this did not sound tautologous perhaps only to the God of Moses (Exodus 3:14).

For Bohm, on the other hand, the quantal was too much. He was quite happy to be classical, even if he would have to remain 'hidden' for it. So, in the face of Bohr's decree, he dared divulge his scheme:

"I cloak (and uncloak only non-locally), therefore I am" (London, 1952).

Although Lord Krishna got away with such a specious trick (Bhagavad-Gita 7:24-25, 8:18-21, 9:4-5), Everett was clearly opposed to it | vehemently opposed to it. For he preferred to be purely quantal all the way! No, no, no, David, he exclaimed,

"I split, therefore I am" (Princeton, 1957).

(Apologies to Karel Kuchar; cf. The Garden of Forking Paths, Jorge Luis Borges, 1941.)

This splitting did a lot of good to Captain Kirk as he boldly took his star-ship Enterprise where no man had gone before.

But others did not feel like splitting | or cloaking, for that matter.

And then there was this curious camp in the battle field, still in awe of Bohr. One of the many puissant emissaries of this largest and oldest camp was Gell-Mann. Reminiscent of Bohr's decree, he appealed to the environment and maintained:

"I decohere, therefore, FAPP, I am" (DLP, 1962 - Omnes, 1994).

(Apologies, again, to Karel Kuchar.)

This seemed to do a lot of good for quantum cosmology, if not for quantum gravity.

Well, perhaps, frowned the mutineers, who found no prudence in decoherence. They preferred the genuine 'I am' and not a FAPP 'I am'. A FAPP 'I am', they cried out, is still only a 'potential' 'I am', not an 'actual' 'I am' | a FAPP 'I am' is no 'I am'!

And, so, they longed for more than just decoherence | so much more that they established a small outpost of their own, and conspired to fudge the Quantum. The commander-in-chief of this small but worthy faction was Ghirardi. From the sanctuary of their godfather John Bell, Ghirardi gathered his troops together and declared:

"I spontaneously localize, therefore I am" (Italy, 1986).

But their fudge remained ad hoc as their physics remained obscure. And most embarrassingly, there also remained the 'tails' of Schrodinger's Cat. They just would not go away. Einstein surely would not have liked this | neither would have Descartes, for that matter.

The tails did not bother Bell though. When 'I am' questioned him about them at a talk at MIT in 1990 shortly before his premature death, he quipped in his characteristic Irish tone: "Your worries are irrational."

They did bother some, however, like Albert and Loewer (1990, 1996), who would rather have their minds split a la Everett than have these tails dawdle around. And even Shimony — a staunch partisan of the fudge — was somewhat concerned about 'I am' if, despite a cleverer fudge, the tails were to remain (1991).

Others murmured that Gravity was the culprit fudging the Quantum. The most prominent voice among these was that of Penrose. Unfortunately, he appeared to be more concerned about "orchestrating" the state of the elusive conscious rather than the state of the poor 'I am'. Nevertheless, as one of the central strategies for accomplishing his primary goal to fathom the conscious, he contended:

"I quantum-gravitate, therefore I am" (Oxford, 1989, 1994).

He would rather quantum-gravitate and, as a result, non-algorithmically spontaneously localize than just boringly decohere.

But, again, no one was there to eradicate the tails. Not even Gravity the Exotic. Surely, the fudge was so constructed that the tails were able to fool Physics; and, thus, it was possible to relocate 'I am' on the wall of almost sound physics. But, of course, that is not where the poor 'I am' belonged; and Metaphysics was not going to be fooled by such an obtuse trick. For, to Metaphysics, the tails were as monstrous as the Cat itself!

Alas! It was not possible to put 'I am' back on the wall of sound metaphysics even with the help of Gravity. Of course, Gell-Mann alone — or DLP (1962) or Hepp (1972), for that matter, long before him — could have put 'I am' on the wall of almost sound physics — and without resorting to the fudge! But that was not the place for 'I am'.

If 'I am' was to remain 'I am', it had to be reestablished on the wall of sound metaphysics, not just physics — albeit with the help of fair Physics. So,

.....was 'I am' an offshoot of a cleverer version of spontaneous-localization due to quantum-gravitation? Or was it an intricate manifestation of a yet-to-be-discovered much more elegant and subtle non-computable facet of the unknown quantum theory of gravity?

'I am' knew not.

For, as long as the tails of the Schrodinger's Cat lingered, 'I am' was no 'I am'.

Thus, for now, 'I am' lay shattered at the bottom of the wall it sought to top, as all the Queen's horses and all the Queen's men toil to put the poor 'I am' back together again. }
