ON THE CAUCHY PROBLEM FOR STOCHASTIC INTEGRO-DIFFERENTIAL EQUATIONS IN THE SCALE SPACES OF GENERALIZED SMOOTHNESS

R. MIKULEVICIUS AND C. PHONSOM

ABSTRACT. Parabolic integro-differential nondegenerate Cauchy problem is considered in the scale of $L_p$ spaces of functions whose regularity is defined by a Levy measure with O-regularly varying radial profile. Existence and uniqueness of a solution is proved by deriving apriori estimates. Some probability density function estimates of the associated Levy process are used as well.

1. Introduction

Let $\sigma \in (0, 2)$ and $\mathfrak{A}^\sigma$ be the class of all nonnegative measures $\nu$ on $\mathbb{R}_0^d = \mathbb{R}^d \setminus \{0\}$ such that $\int |y|^2 \wedge 1d\nu < \infty$ and

$$\sigma = \inf \left\{ \alpha < 2 : \int_{|y| \leq 1} |y|^\alpha d\nu < \infty \right\}.$$  

In addition, we assume that for $\nu \in \mathfrak{A}^\sigma$,

$$\int_{|y| > 1} |y| d\nu < \infty \text{ if } \sigma \in (1, 2),$$

$$\int_{R < |y| \leq R'} y d\nu = 0 \text{ if } \sigma = 1 \text{ for all } 0 < R < R' < \infty.$$  

Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a complete probability space with a filtration of $\sigma$–algebras on $\mathbb{F} = (\mathcal{F}_t, t \geq 0)$ satisfying the usual conditions. Let $\mathcal{R} (\mathbb{F})$ be the progressive $\sigma$–algebra on $[0, \infty) \times \Omega$. Let $(U, \mathcal{U}, \Pi)$ be a measurable space with $\sigma$–finite measure $\Pi, \mathcal{R}_0^d = \mathbb{R}^d \setminus \{0\}.$ Let $p (dt, dz)$ be $\mathbb{F}$–adapted point measures on $([0, \infty) \times U, \mathcal{B} ([0, \infty)) \otimes \mathcal{U})$ with compensator $\Pi (dz) dt$. We denote the martingale measure $q (dt, dz) = p (dt, dz) - \Pi (dz) dt.$

In this paper we consider the stochastic parabolic Cauchy problem

$$du (t, x) = [Lu (t, x) - \lambda u (t, x) + f (t, x)] dt$$

$$+ \int_{\mathcal{U}} \Phi (t, x, z) q (dt, dz),$$

$$u (0, x) = g (x), (t, x) \in E = [0, T] \times \mathbb{R}^d,$$

with $\lambda \geq 0$ and integro-differential operator

$$L \varphi (x) = L' \varphi (x) = \int [\varphi (x + y) - \varphi (x) - \chi_{\sigma} (y) \cdot \nabla \varphi (x)] \nu (dy), \varphi \in C_0^\infty (\mathbb{R}^d),$$

where $\nu \in \mathfrak{A}^\sigma, \chi_{\sigma} (y) = 0$ if $\sigma \in [0, 1), \chi_{\sigma} (y) = 1_{\{|y| \leq 1\}} (y)$ if $\sigma = 1$ and $\chi_{\sigma} (y) = 1$ if $\sigma \in (1, 2).$ The symbol of $L$ is

$$\psi (\xi) = \psi' (\xi) = \int \left[ e^{i \xi \cdot y} - 1 - i2\pi \chi_{\sigma} (y) \xi \cdot y \right] \nu (dy), \xi \in \mathbb{R}^d.$$  

Note that $\nu (dy) = dy / |y|^{d+\sigma} \in \mathfrak{A}^\sigma$ and, in this case, $L = L' = c (\sigma, d) (-\Delta)^{\sigma/2},$ where $(-\Delta)^{\sigma/2}$ is a fractional Laplacian. The equation (1.1) is forward Kolmogorov equation for the Levy process associated to $\psi'$. We assume that $g, f$ and $\Phi$ are resp. $\mathcal{F}_0 \otimes \mathcal{B} (\mathbb{R}^d), \mathcal{R} (\mathbb{F}) \otimes \mathcal{B} (\mathbb{R}^d), \mathcal{F} \otimes \mathcal{B} (\mathbb{R}^d) \otimes \mathcal{U}$–measurable. 

We define for $\nu \in \mathfrak{A}^\sigma$ its radial distribution function

$$\delta (r) = \delta_\nu (r) = \nu \left( x \in \mathbb{R}^d : |x| > r \right), r > 0,$$

and

$$w (r) = w_\nu (r) = \delta_\nu (r)^{-1}, r > 0.$$
Let $\delta$ be continuous, and $\lim_{r\to 0} \delta(r) = \infty$. One of our main assumptions is that $w_\nu (r)$ is an O-RV function at both infinity and at zero. That is

$$r_1(x) = \lim_{\epsilon \to 0} \sup_{\epsilon \to 0} \frac{w_\nu (\epsilon x)}{w_\nu (\epsilon)} < \infty, \quad r_2(x) = \lim_{\epsilon \to \infty} \frac{w_\nu (\epsilon x)}{w_\nu (\epsilon)} < \infty, \quad x > 0.$$  

The regular variation functions were introduced in [9] and used in tauberian theorems which were extended to O-RV functions as well (see [1], [3], and references therein). They are very convenient for the derivation of our main estimates.

Given $\nu \in \mathfrak{X}^\sigma, p \in [1, \infty), s \in \mathbb{R}$, we denote $H^s_p (E) = H^{\nu, s}_p (E)$ the closure in $L_p (E)$ of $C^\infty_0 (E)$ with respect to the norm

$$|f|_{H^{\nu, s}_p (E)} = |F^{-1} (1 - \Re \psi^{\nu}) Ff|_{L_p (E)},$$

where $F$ is the Fourier transform in space variable. We denote $\mathbb{H}^s_p (E) = H^{\nu, s}_p (E)$ the corresponding space of random functions $u (t, x), (t, x) \in E$. In this paper, under O-RV of $w$ and nondegeneracy assumptions (see assumptions $A, B$ below), we prove the existence and uniqueness of solutions to (1.1) in the scale of spaces $H^{\nu, s}_p (E)$. Moreover,

$$(1.2) \quad |u|_{H^{\nu, s}_p (E)} \leq C \left[ |f|_{H^{\nu, s-1}_p (E)} + |g|_{H^{s-\frac{1}{2}}_p (\mathbb{R}^d)} + |\Phi|_{\mathbb{H}^{s-\frac{1}{2}}_{2, p} (E)} + |\Phi|_{\mathbb{H}^{s-\frac{1}{2}}_{p, p} (E)} \right]$$

if $p \geq 2$, where $\mathbb{H}^{s, pp}_p$ is the Besov "counterpart" of $\mathbb{H}^s_p$.

This paper is a continuation of [14] and [15], where (1.1) with $\Phi = 0$ was considered. The conditions imposed in this paper are more natural for needed computations. Since the symbol $\psi^{\nu} (\xi)$ is not smooth in $\xi$, the standard Fourier multiplier results do not apply in this case. In order to prove the estimate involving $\Phi$ in (1.2), we follow the idea of [11], by applying a version of Calderon-Zygmund theorem by associating to $L^\nu$ a family of balls and verifying for it the stochastic Hörmander condition (see Theorem 2.5 in [11]).

As an example, we consider $\nu \in \mathfrak{X}^\sigma$ defined in radial and angular coordinates $r = |y|, z = y/r, as$

$$(1.3) \quad \nu (\Gamma) = \int_0^{\infty} \int_{|z| = 1} \chi_\Gamma (rz) a(r, z) j(r) r^{d-1} S(dz) dr, \Gamma \in \mathcal{B} (\mathbb{R}^d _0),$$

where $S(dz)$ is a finite measure on the unit sphere on $\mathbb{R}^d$. In [21], (1.1) was considered in the standard fractional Sobolev spaces using $L^\infty$-$BMO$ type estimate, with $g = 0, \Phi = 0$ and a nondegenerate $\nu$ in the form (1.3) with $a = 1, j(r) = r^{-d-\sigma}$. In [10], an elliptic problem in the whole space with $L^\nu$ was studied for $\nu$ in the form (1.3) with $S(dz) = dz$ being a Lebesgue measure on the unit sphere in $\mathbb{R}^d$, with $0 < c_1 \leq a \leq c_2$, and a set of technical assumptions on $j(r)$. A sharp function estimate based on the solution Hölder norm estimate (following the idea in [5]) was used in [10]. The conditions imposed in this paper are more general than those in [10] [14] [15] [21] and thus our main results cover more examples of $\nu$ (see in particular example [1]).
The paper is organized as follows. In Section 2, the main theorem is stated, and some examples are considered. In Section 3, some auxiliary results on O-RV functions and probability density estimates are presented. In section 4, results on characterization of function spaces and approximation of input functions are presented. In section 5, the main result is proved. In Appendix, stochastic integrals driven by jump measures are constructed and a non-degeneracy estimate presented.

2. Notations, function spaces, main results and examples

2.1. Notation. The following notation will be used in the paper.

Let \( \mathbb{N} = \{1, 2, \ldots\}, \mathbb{N}_0 = \{0, 1, \ldots\}, \mathbb{R}_0^d = \mathbb{R}^d \setminus \{0\}. \) If \( x, y \in \mathbb{R}^d \), we write
\[
x \cdot y = \sum_{i=1}^{d} x_i y_i, \quad |x| = \sqrt{x \cdot x}.
\]

We denote by \( C_0^\infty (\mathbb{R}^d) \) the set of all infinitely differentiable functions on \( \mathbb{R}^d \) with compact support.

We denote the partial derivatives in \( x \) of a function \( u(t, x) \) on \( \mathbb{R}^d + 1 \) by \( \partial u / \partial x_i, \partial^2 u / \partial x_i \partial x_j, \) etc.; \( Du = \nabla u = (\partial_1 u, \ldots, \partial_d u) \) denotes the gradient of \( u \) with respect to \( x \); for a multiindex \( \gamma \in \mathbb{N}_0^d \) we denote
\[
D_\gamma u(t, x) = \frac{\partial^{\left| \gamma \right|} u(t, x)}{\partial x_1^{\gamma_1} \ldots \partial x_d^{\gamma_d}}.
\]

For \( \alpha \in (0, 2] \) and a function \( u(t, x) \) on \( \mathbb{R}^{d+1} \), we write
\[
\partial^\alpha u(t, x) = -F^{-1}(|\xi|^\alpha F u(t, \xi))(x),
\]
where
\[
F h(t, \xi) = \hat{h}(t, \xi) = \int_{\mathbb{R}^d} e^{-i2\pi \xi \cdot x} h(t, x) dx, F^{-1} h(t, \xi) = \int_{\mathbb{R}^d} e^{i2\pi \xi \cdot x} h(t, \xi) d\xi.
\]

For \( \nu \in \mathbb{N}^d \), we denote \( Z^\nu_t, t \geq 0 \), the Levy process associated to \( L^\nu \), i.e., \( Z^\nu_t \) is cadlag with independent increments and its characteristic function
\[
E e^{i2\pi \xi \cdot Z^\nu_t} = \exp \{ \psi^\nu(\xi) t \}, \xi \in \mathbb{R}^d, t \geq 0.
\]
The letters \( C = C(\cdot, \ldots, \cdot) \) and \( c = c(\cdot, \ldots, \cdot) \) denote constants depending only on quantities appearing in parentheses. In a given context the same letter will (generally) be used to denote different constants depending on the same set of arguments.

2.2. Function spaces. Let \( V \) be a Banach space with norm \( |\cdot|_V \). Let \( S(\mathbb{R}^d; V) \) be the Schwartz space of \( V \)-valued rapidly decreasing functions. We use standard notation \( S(\mathbb{R}^d) \) when \( V = \mathbb{R} \).

For a \( V \)-valued measurable function \( h \) on \( \mathbb{R}^d \) and \( p \geq 1 \) we denote
\[
|h|_{V,p}^p = \int_{\mathbb{R}^d} |h(x)|_V^p dx.
\]
We fix $\nu \in \mathfrak{A}^\sigma$. Obviously, $\Re \psi^\nu = \psi^\nu_{\text{sym}}$, where
\[ \nu_{\text{sym}}(dy) = \frac{1}{2} \left[ \nu(dy) + \nu(-dy) \right]. \]

Let
\[ Jf = J_{\nu}f = (I - L^\nu_{\text{sym}})f = f - L^\nu_{\text{sym}}f, f \in \mathcal{S}(\mathbb{R}^d, V). \]

For $s \in \mathbb{R}$ set
\[ J^sf = (I - L^\nu_{\text{sym}})^s f = \mathcal{F}^{-1}[(1 - \psi^\nu_{\text{sym}})^s \hat{f}], f \in \mathcal{S}(\mathbb{R}^d, V). \]

Further, for a characterization of our function spaces we will use the
We fix $\nu \in \mathfrak{A}^\sigma$. Obviously, $\Re \psi^\nu = \psi^\nu_{\text{sym}}$, where
\[ \nu_{\text{sym}}(dy) = \frac{1}{2} \left[ \nu(dy) + \nu(-dy) \right]. \]

Let
\[ Jf = J_{\nu}f = (I - L^\nu_{\text{sym}})f = f - L^\nu_{\text{sym}}f, f \in \mathcal{S}(\mathbb{R}^d, V). \]

For $s \in \mathbb{R}$ set
\[ J^sf = (I - L^\nu_{\text{sym}})^s f = \mathcal{F}^{-1}[(1 - \psi^\nu_{\text{sym}})^s \hat{f}], f \in \mathcal{S}(\mathbb{R}^d, V). \]

Note that $L^{\nu,1}f = L^\nu_{\text{sym}}f, f \in \mathcal{S}(\mathbb{R}^d)$.

For $p \in [1, \infty), s \in \mathbb{R}$, we define, following [6], the Bessel potential space
\[ H^s_p(\mathbb{R}^d, V) = H^{\nu,s}_p(\mathbb{R}^d, V) \]
as the closure of $\mathcal{S}(\mathbb{R}^d, V)$ in the norm
\[ |f|_{H^s_p(\mathbb{R}^d, V)} = |J^sf|_{L^p(\mathbb{R}^d, V)} = |\mathcal{F}^{-1}[(1 - \psi^\nu_{\text{sym}})^s \hat{f}]|_{L^p(\mathbb{R}^d, V)} = |(I - L^\nu_{\text{sym}})^s f|_{L^p(\mathbb{R}^d, V)}, f \in \mathcal{S}(\mathbb{R}^d, V). \]

According to Theorem 2.3.1 in [6], $H^s_p(\mathbb{R}^d) \subseteq H^s_p(\mathbb{R}^d)$ is continuously embedded if $p \in (1, \infty), s < t$, $H^0_p(\mathbb{R}^d) = L^p(\mathbb{R}^d)$. For $s \geq 0, p \in [1, \infty)$, the norm $|f|_{H^s_p(\mathbb{R}^d)}$ is equivalent to (see Theorem 2.2.7 in [6])
\[ |f|_{H^s_p(\mathbb{R}^d)} = |f|_{L^p(\mathbb{R}^d)} + |\mathcal{F}^{-1}[(1 - \psi^\nu_{\text{sym}})^s \mathcal{F}f]|_{L^p(\mathbb{R}^d)}. \]

Further, for a characterization of our function spaces we will use the

**Remark 1.** For an integer $N > 1$ there exists a function $\phi = \phi^N \in C^\infty(\mathbb{R}^d)$ (see Lemma 6.1.7 in [2]), such that $\text{supp} \phi = \{ \xi : \frac{1}{N} \leq |\xi| \leq N \}$, $\phi(\xi) > 0$ if $N^{-1} < |\xi| < N$ and
\[ \sum_{j=-\infty}^{\infty} \phi(N^{-j} \xi) = 1 \quad \text{if} \quad \xi \neq 0. \]

Let
\[ \tilde{\phi}(\xi) = \phi(N\xi) + \phi(\xi) + \phi(N^{-1}\xi), \xi \in \mathbb{R}^d. \]

Note that $\text{supp} \tilde{\phi} \subseteq \{ N^{-2} \leq |\xi| \leq N^2 \}$ and $\tilde{\phi}\phi = \phi$. Let $\varphi_k = \varphi^N_k = \mathcal{F}^{-1}\phi(N^{-k}.), k \geq 1$, and $\varphi_0 = \varphi^N_0 \in \mathcal{S}(\mathbb{R}^d)$ is defined as
\[ \varphi_0 = \mathcal{F}^{-1} \left[ 1 - \sum_{k=1}^{\infty} \phi(N^{-k}.) \right]. \]
Let \( \phi_0 (\xi) = \mathcal{F} \varphi_0 (\xi), \tilde{\phi}_0 (\xi) = \mathcal{F} \varphi_0 (\xi) + \mathcal{F} \varphi_1 (\xi), \xi \in \mathbb{R}^d, \varphi = \mathcal{F}^{-1} \tilde{\phi}, \varphi = \mathcal{F}^{-1} \phi, \) and

\[
\tilde{\varphi}_k = \sum_{l=-1}^{1} \varphi_{k+l}, k \geq 1, \tilde{\varphi}_0 = \varphi_0 + \varphi_1
\]

that is

\[
\mathcal{F} \tilde{\varphi}_k = \varphi \left( N^{-k+1} \xi \right) + \varphi \left( N^{-k} \xi \right) + \varphi \left( N^{-k-1} \xi \right) = \tilde{\varphi} \left( N^{-k} \xi \right), \xi \in \mathbb{R}^d, k \geq 1.
\]

Note that \( \varphi_k = \tilde{\varphi}_k * \varphi_k, k \geq 0. \) Obviously, \( f = \sum_{k=0}^{\infty} f * \varphi_k \) in \( S' (\mathbb{R}^d) \) for \( f \in \mathcal{S} (\mathbb{R}^d) \).

Let \( s \in \mathbb{R} \) and \( p, q \geq 1. \) For \( \nu \in \mathfrak{A}, \) we introduce the Besov space \( B^s_{pq} = B^{s}_{pq}(\mathbb{R}^d, V) \) as the closure of \( \mathcal{S} (\mathbb{R}^d, V) \) in the norm

\[
|f|_{B^s_{pq}(\mathbb{R}^d,V)} = \left( \sum_{j=0}^{\infty} |J^s \varphi_j * f|_{L^p(\mathbb{R}^d,V)}^q \right)^{1/q},
\]

where \( J = J_\nu = I - L^{\nu, \text{sym}}. \)

We introduce the corresponding spaces of functions on \( E = [0,T] \times \mathbb{R}^d. \) The spaces \( B^s_{pq}(E, V) \) (resp. \( H^s_{pq}(E, V) \)) consist of all measurable \( B^s_{pq}(\mathbb{R}^d, V) \) (resp. \( H^s_{pq}(\mathbb{R}^d, V) \)) -valued functions \( f \) on \( [0,T] \) with finite corresponding norms:

\[
|f|_{B^s_{pq}(E,V)} = |f|_{B^s_{pq}(E,V)} = \left( \int_0^T |f(t, \cdot)|_{B^s_{pq}(\mathbb{R}^d,V)}^q dt \right)^{1/q},
\]

\[
|f|_{H^s_{pq}(E,V)} = |f|_{H^s_{pq}(E,V)} = \left( \int_0^T |f(t, \cdot)|_{H^s_{pq}(\mathbb{R}^d,V)}^p dt \right)^{1/p}.
\]

Similarly we introduce the corresponding spaces of random functions. Let \( (\Omega, \mathcal{F}, \mathbb{P}) \) be a complete probability spaces with a filtration of \( \sigma \)-algebras \( \mathbb{F} = \{ \mathcal{F}_t \} \) satisfying the usual conditions. Let \( \mathcal{R} (\mathbb{F}) \) be the progressive \( \sigma \)-algebra on \( [0,\infty) \times \Omega. \)

The spaces \( \mathbb{B}^s_{pq}(\mathbb{R}^d, V) \) and \( \mathbb{H}^s_p(\mathbb{R}^d, V) \) consists of all \( \mathcal{F} \)-measurable random functions \( f \) with values in \( B^s_{pq}(\mathbb{R}^d, V) \) and \( H^s_p(\mathbb{R}^d, V) \) with finite norms

\[
|f|_{\mathbb{B}^s_{pq}(\mathbb{R}^d,V)} = \left\{ \mathbb{E} \left| f \right|_{B^s_{pq}(\mathbb{R}^d,V)}^p \right\}^{1/p}
\]

and

\[
|f|_{\mathbb{H}^s_p(\mathbb{R}^d,V)} = \left\{ \mathbb{E} \left| f \right|_{H^s_p(\mathbb{R}^d,V)}^p \right\}^{1/p}.
\]
The spaces $\mathbb{B}^s_{pp}(E,V)$ and $\mathbb{H}^s_{pp}(E,V)$ consist of all $\mathcal{R}(\mathbb{F})$-measurable random functions with values in $\mathcal{B}^s_{pp}(E,V)$ and $H^s_p(E,V)$ with finite norms

$$|f|_{\mathbb{B}^s_{pp}(E,V)} = \left\{ \mathbb{E} |f|^p_{\mathcal{B}^s_{pp}(E,V)} \right\}^{1/p}$$

and

$$|f|_{\mathbb{H}^s_{pp}(E,V)} = \left\{ \mathbb{E} |f|^p_{H^s_p(E,V)} \right\}^{1/p}.$$  

**Remark 2.** (see [15]) For every $\varepsilon > 0$, $p > 1$, $B^{\nu,\varepsilon}_p(\mathbb{R}^d)$ is continuously embedded into $H^{\nu,\varepsilon}_p(\mathbb{R}^d)$; for $p \geq 2$, $H^{\nu,\varepsilon}_p(\mathbb{R}^d)$ is continuously embedded into $B^{\nu,\varepsilon}_p(\mathbb{R}^d)$.

If $V_r = L_r(U,\mathcal{U},\Pi), r \geq 1$, the space of $r$-integrable measurable functions on $U$, and $V_0 = \mathbb{R}$, we write

$$B^s_{r,pp}(A) = B^s_{pp}(A,V), \quad \mathbb{B}^s_{r,pp}(A) = \mathbb{B}^s_{pp}(A,V),$$

$$H^s_{r,p}(A) = H^s_p(A,V), \quad \mathbb{H}^s_{r,p}(A) = \mathbb{H}^s_p(A,V),$$

and

$$L_{r,p}(A) = H^0_{r,p}(A), \quad \mathbb{L}_{r,p}(A) = \mathbb{H}^0_{r,p}(A),$$

where $A = \mathbb{R}^d$ or $E$. For scalar functions we drop $V$ in the notation of function spaces.

Let $U_n \in \mathcal{U}, U_n \subseteq U_{n+1}, n \geq 1, \cup_n U_n = U$ and $\Pi(U_n) < \infty, n \geq 1$. We denote by $\mathcal{C}_{r,p}^\infty(E), 1 \leq p < \infty$, the space of all $\mathcal{R}(\mathbb{F}) \otimes \mathcal{B}(\mathbb{R}^d)$-measurable random functions $\Phi$ on $E$ such that for every multiindex $\gamma \in \mathbb{N}_0^d$,

$$\mathbb{E} \int_0^T \sup_{t \in \mathbb{R}^d} |D^\gamma \Phi(t,x)|^p_{L_p(V_r)} dt + \mathbb{E} \left[ |D^\gamma \Phi|^p_{L_p(E,V_r)} \right] < \infty,$$

and $\Phi = \Phi \chi_{U_n}$ for some $n$ if $r = 2, p$. Similarly we define the space $\mathcal{C}_{r,p}^\infty(\mathbb{R}^d)$ by replacing $\mathcal{R}(\mathbb{F})$ and $E$ by $\mathcal{F}$ and $\mathbb{R}^d$ respectively in the definition of $\mathcal{C}_{r,p}^\infty(E)$.

**2.3. Main results.** We set for $\nu \in \mathfrak{A}^\sigma$

$$\delta(r) = \delta_{\nu}(r) = \nu \left( x \in \mathbb{R}^d : |x| > r \right), r > 0$$

$$w(r) = w_{\nu}(r) = \delta_{\nu}(r)^{-1}, r > 0.$$

Our main assumption is that $w = w_{\nu}(r)$ is an O-RV function at both infinity and at zero. That is $w$ is a positive, finite, measurable function and

$$r_1(x) = \lim_{\epsilon \to 0} \sup_{x} \frac{w(\epsilon x)}{w(\epsilon)} < \infty, \quad r_2(x) = \lim_{\epsilon \to \infty} \sup_{x} \frac{w(\epsilon x)}{w(\epsilon)} < \infty, x > 0.$$

By Theorem 2 in [1], the following limit exist:

$$\lim_{\epsilon \to 0} \frac{\log r_1(\epsilon)}{\log \epsilon} \leq q_1 = q_1^w = \lim_{\epsilon \to \infty} \frac{\log r_1(\epsilon)}{\log \epsilon}.$$
and
\[ p_2 = p_2^w = \lim_{\epsilon \to 0} \frac{\log r_2(\epsilon)}{\log \epsilon} \leq q_2 = q_2^w = \lim_{\epsilon \to \infty} \frac{\log r_2(\epsilon)}{\log \epsilon}. \]

Note that \( p_1 \leq \sigma \leq q_1 \) (see [13]). We will assume throughout this paper that \( p_1, p_2, q_1, q_2 > 0 \). The numbers \( p_1, p_2 \) are called lower indices and \( q_1, q_2 \) are called upper indices of O-RV function.

When the context is clear, for a function \( f \) which is both O-RV at zero and infinity we always denote its lower index at zero by \( p_1 \), upper index at zero by \( q_1 \), lower index at infinity by \( p_2 \) and upper index at infinity by \( q_2 \). If we wish to be precise, we will write \( p_1^f, p_2^f, q_1^f, q_2^f \). For brevity, we sometimes say that \( f \) is an O-RV function if it is both O-RV at zero and infinity.

The main result for (1.1) is the following statement.

**Theorem 1.** Let \( p \in (1, \infty) \), \( s \in \mathbb{R} \). Let \( \nu \in \mathfrak{F}^\sigma \), and \( w = w_\nu \) be continuous O-RV function at zero and infinity with \( p_i, q_i, i = 1, 2 \), defined in (2.3), (2.4). Assume

**A.** for \( i = 1, 2 \)
\[ 0 < p_i \leq q_i < 1 \text{ if } \sigma \in (0, 1), \quad 0 < p_i \leq q_i < 2 \text{ if } \sigma = 1, \]
\[ 1 < p_i \leq q_i < 2 \text{ if } \sigma \in (1, 2). \]

**B.**
\[ \inf_{R \in (0, \infty), |\xi| = 1} \int_{|y| \leq 1} |\hat{\xi} \cdot y|^2 \tilde{\nu}_R(dy) > 0, \]
where \( \tilde{\nu}_R(dy) = w(R) \nu (Rdy) \). Then for each \( f \in \mathbb{H}^{\nu,s}_p(E), g \in \mathbb{H}^{\nu,s+1-1/p}_{pp}(\mathbb{R}^d) \), \( \Phi \in \mathbb{H}^{\nu,s+1-1/p}_{pp}(E) \cap \mathbb{H}^{\nu,s+1/2}_{2,p}(E) \) if \( p \in [2, \infty) \) and \( \Phi \in \mathbb{H}^{\nu,s+1-1/p}_{pp}(E) \) if \( p \in (1, 2) \), there is a unique \( u \in \mathbb{H}^{\nu,s+1}_p(E) \) solving (1.1). Moreover, there is \( C = C(d, p, \nu) \) such that for \( p \in [2, \infty) \),
\[ |L^\nu u|_{\mathbb{H}^{\nu,s}_p(E)} \]
\[ \leq C \left[ |f|_{\mathbb{H}^{\nu,s}_p(E)} + |g|_{\mathbb{H}^{\nu,s+1-1/p}_{pp}(\mathbb{R}^d)} + |\Phi|_{\mathbb{H}^{\nu,s+1-1/p}_{pp}(E)} + |\Phi|_{\mathbb{H}^{\nu,s+1/2}_{2,p}(E)} \right], \]
\[ |u|_{\mathbb{H}^{\nu,s}_p(E)} \]
\[ \leq C[p^{1/p}_\lambda |f|_{\mathbb{H}^{\nu,s}_p(E)} + \rho^{1/p}_\lambda |g|_{\mathbb{H}^{\nu,s}_p(E)} + \rho^{1/2}_\lambda |\Phi|_{\mathbb{H}^{\nu,s}_p(E)} + \rho^{1/2}_\lambda |\Phi|_{\mathbb{H}^{\nu,s}_p(E)}], \]
and for \( p \in (1, 2) \),
\[ |L^\nu u|_{\mathbb{H}^{\nu,s}_p(E)} \leq C \left[ |f|_{\mathbb{H}^{\nu,s}_p(E)} + |g|_{\mathbb{H}^{\nu,s+1-1/p}_{pp}(\mathbb{R}^d)} + |\Phi|_{\mathbb{H}^{\nu,s+1-1/p}_{pp}(E)} \right], \]
\[ |u|_{\mathbb{H}^{\nu,s}_p(E)} \leq C \left[ \rho^{1/p}_\lambda |f|_{\mathbb{H}^{\nu,s}_p(E)} + \rho^{1/p}_\lambda |g|_{\mathbb{H}^{\nu,s}_p(E)} + \rho^{1/p}_\lambda |\Phi|_{\mathbb{H}^{\nu,s}_p(E)} \right], \]
where \( \rho_\lambda = \frac{1}{\lambda} \wedge T. \)

Note that the assumption A depends on \( \nu \) only through \( w = w_\nu \).

The following examples are taken from [13].
Example 1. According to [4] (pp. 70-74), any Levy measure \( \nu \in \mathfrak{X}^\sigma \) can be disintegrated as

\[
\nu (\Gamma) = - \int_0^\infty \int_{S_{d-1}} \chi_\Gamma (rz) \Pi (r, dz) d\delta_\nu (r), \Gamma \in \mathcal{B} \left( \mathbb{R}_0^d \right),
\]

where \( \delta = \delta_\nu \), and \( \Pi (r, dz), r > 0 \) is a measurable family of measures on the unit sphere \( S_{d-1} \) with \( \Pi (r, S_{d-1}) = 1, r > 0 \). If \( w_\nu = \delta^{-1} \) is continuous, \( O-RV \) at zero and infinity, and satisfies assumption \( A \). Assume that

\[
\left| \{ s \in [0,1] : r_i (s) < 1 \} \right| > 0, \ i = 1, 2,
\]

and for all \( 0 < r \leq R \),

\[
c^{-1} \left( \frac{R}{r} \right)^{\delta_1} \leq \frac{\phi (R)}{\phi (r)} \leq c \left( \frac{R}{r} \right)^{\delta_2}.
\]

(ii) There is a function \( \rho_0 (z) \) defined on the unit sphere such that \( \rho_0 (z) \leq a (r, z) \leq 1, r > 0, z \in S_{d-1} \), and for all \( |\xi| = 1 \),

\[
\int_{S_{d-1}} |\xi \cdot z|^2 \rho_0 (z) S (dz) \geq c > 0.
\]

Under these assumptions it can be shown that \( B \) holds, and \( w_\nu \) is an \( O-RV \) function with \( 2\delta_1 \leq p_i^{\nu} \leq q_i^{\nu} \leq 2\delta_2, i = 1, 2 \).
3. Auxiliary results

3.1. Some estimates of O-RV functions. We start with a simple but useful corollaries about functions that are O-RV at both zero and infinity. For \( \nu \in \mathcal{A}^\sigma, R > 0 \), we denote \( \nu_R (dy) = w_\nu (R) \nu (R dy) \).

First we note scaling property of functions \( w : (0, \infty) \to (0, \infty) \) that are non-decreasing, O-RV at both zero and infinity with strictly positive lower indices.

**Lemma 1.** Let \( \nu \in \mathcal{A}^\sigma \), and \( w = w_\nu \) be an O-RV function at zero and infinity with \( p_i, q_i, i = 1, 2 \), defined in (2.3), (2.4), and assumption \( \Lambda \) holds. Then for any \( \alpha_1 > q_1 \lor q_2 \), \( 0 < \alpha_2 < p_1 \land p_2 \), there exist \( c_1 = c_1 (\alpha_1) > 0, c_2 = c_2 (\alpha_2) > 0 \) such that
\[
0 < x \leq y < \infty
\]

\[
c_1 \left( \frac{y}{x} \right)^{\alpha_2} \leq \frac{w(y)}{w(x)} \leq c_2 \left( \frac{y}{x} \right)^{\alpha_1},
\]

\[
\text{Proof.} \quad \text{Due to similarity, we only show the right hand side of the inequality. By Karamata characterization (see (1.7) of \cite{1}) of O-RV functions, there are}
0 < \eta_1 < \eta_2 \text{ such that the RHS inequality holds if either } x \lor y \leq \eta_1 \text{ or } x \land y \geq \eta_2. \]

\[
\frac{w(y)}{w(x)} = \frac{w(y)}{w(\eta_2)} \frac{w(\eta_1)}{w(x)} \leq c \left( \frac{y}{x} \right)^{\alpha_1} \frac{w(\eta_2)}{w(\eta_1)},
\]

and similarly we consider other cases. \( \Box \)

**Remark 3.** It trivially follows from Lemma 1 that \( \lim_{r \to 0} \omega (r) = 0 \) and \( \lim_{r \to \infty} \omega (r) = \infty \).

The following statement holds

**Lemma 2.** (Lemma 8 in \cite{13}) Assume \( w(r), r > 0 \), is an O-RV function at zero with lower and upper indices \( p_1, q_1 \), that is,
\[
r_1 (x) = \lim_{\epsilon \to 0} \frac{w(\epsilon x)}{w(\epsilon)} < \infty, x > 0,
\]

and
\[
p_1 = \lim_{\epsilon \to 0} \frac{\log r_1 (\epsilon)}{\log \epsilon} \leq q_1 = \lim_{\epsilon \to \infty} \frac{\log r_1 (\epsilon)}{\log \epsilon}.
\]

a) Let \( \beta > 0 \) and \( \tau > -\beta p_1 \). There is \( C > 0 \) so that
\[
\int_0^x t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in (0, 1],
\]

and \( \lim_{x \to 0} x^\tau w(x)^\beta = 0 \).

b) Let \( \beta > 0 \) and \( \tau < -\beta q_1 \). There is \( C > 0 \) so that
\[
\int_x^1 t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in (0, 1],
\]

and \( \lim_{x \to 0} x^\tau w(x)^\beta = \infty \).
c) Let \( \beta < 0 \) and \( \tau > -\beta q_1 \). There is \( C > 0 \) so that
\[
\int_0^x t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in (0, 1],
\]
and \( \lim_{x \to 0} x^\tau w(x)^\beta = 0 \).

d) Let \( \beta < 0 \) and \( \tau < -\beta p_1 \). There is \( C > 0 \) so that
\[
\int_1^x t^\tau w(t)^\beta \frac{dt}{t} = \int_{x^{-1}}^{1} t^{-\tau} w(\frac{1}{t})^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in (0, 1],
\]
and \( \lim_{x \to 0} x^\tau w(x)^\beta = \infty \).

Similar statement holds for O-RV functions at infinity.

**Lemma 3.** Assume \( w(r), r > 0 \), is an O-RV function at infinity with lower and upper indices \( p_2, q_2 \), that is,
\[
r_2(x) = \lim_{\varepsilon \to \infty} \frac{w(\varepsilon x)}{w(\varepsilon)} < \infty, x > 0,
\]
and
\[
p_2 = \lim_{\varepsilon \to 0} \frac{\log r_2(\varepsilon)}{\log \varepsilon} \leq q_2 = \lim_{\varepsilon \to \infty} \frac{\log r_2(\varepsilon)}{\log (\varepsilon)}.
\]

a) Let \( \beta > 0 \) and \( -\tau > \beta q_2 \). There is \( C > 0 \) so that
\[
\int_{x^{-1}}^{x} t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in [1, \infty),
\]
and \( \lim_{x \to \infty} x^\tau w(x)^\beta = 0 \).

b) Let \( \beta > 0 \) and \( -\tau < \beta p_2 \). There is \( C > 0 \) so that
\[
\int_{1}^{x} t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in [1, \infty),
\]
and \( \lim_{x \to \infty} x^\tau w(x)^\beta = \infty \).

c) Let \( \beta < 0 \) and \( \tau < -\beta p_2 \). There is \( C > 0 \) so that
\[
\int_{x^{-1}}^{x} t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in [1, \infty),
\]
and \( \lim_{x \to \infty} x^\tau w(x)^\beta = 0 \).

d) Let \( \beta < 0 \) and \( \tau > -\beta q_2 \). There is \( C > 0 \) so that
\[
\int_{1}^{x} t^\tau w(t)^\beta \frac{dt}{t} \leq C x^\tau w(x)^\beta, x \in [1, \infty),
\]
and \( \lim_{x \to \infty} x^\tau w(x)^\beta = \infty \).

**Proof.** The claims follow easily by Theorems 3, 4 in [1]. Because of the similarities, we will prove d) only. Let \( \beta < 0 \) and \( \tau > -\beta q_2 \). Then
\[
\lim_{t \to \infty} \frac{w(\varepsilon t)^\beta}{w(t)^\beta} = \lim_{t \to \infty} \frac{w(\varepsilon^{-1} \varepsilon t)^{-\beta}}{w(t)^{-\beta}} = r_2(\varepsilon^{-1})^{-\beta} < \infty, \varepsilon > 0.
\]
Hence \( w(t)^{\beta}, t \geq 1 \), is an O-RV function at infinity with
\[
p = \lim_{\varepsilon \to 0} \frac{\log r_2 (\varepsilon^{-1})^{-\beta}}{\log \varepsilon} = \beta q_2 \leq \beta p_2 = -\lim_{\varepsilon \to 0} \frac{\log r_2 (\varepsilon)^{-\beta}}{\log \varepsilon} = q.
\]
Then by Theorems 3 and 4 in [1], for \( \tau > -\beta q_2 \),
\[
\int_{1}^{x} t^{\tau} w(t)^{\beta} \frac{dt}{t} \leq C x^{\tau} w(x)^{\beta}, \quad x \geq 1,
\]
and \( \lim_{x \to \infty} x^{\tau} w(x)^{\beta} = \infty. \)

\[\square\]

**Lemma 4.** Let \( \nu \in \mathcal{Q}, w = w_{\nu} \) be an O-RV function at zero and infinity with indices \( p_1, q_1, p_2, q_2 \) defined in (2.3), (2.4). Then for any \( \alpha_1 > q_1 \) and \( 0 < \alpha_2 < p_1 \) \& \( p_2 \), there is \( C = C(w, \alpha_1, \alpha_2) > 0 \) such that
\[
\int_{|y| \leq 1} |y|^{\alpha_1} \bar{\nu}(dy) + \int_{|y| > 1} |y|^{\alpha_2} \bar{\nu}(dy) \leq C, R > 0.
\]

**Proof.** First,
\[
\int_{|y| \leq 1} |y|^{\alpha_1} \bar{\nu}(dy) = \delta(r)^{-1} r^{-\alpha_1} \int_{|y| \leq r} |y|^{\alpha_1} \nu(dy)
= \delta(r)^{-1} r^{-\alpha_1} \alpha_1 \int_{0}^{r} s^{\alpha_1} [\delta(s) - \delta(r)] \frac{ds}{s}
= \delta(r)^{-1} r^{-\alpha_1} \alpha_1 \int_{0}^{r} \delta(s) s^{\alpha_1-1} ds - 1,
\]
and similarly,
\[
\int_{|y| > 1} |y|^{\alpha_2} \bar{\nu}(dy) = w(r) r^{-\alpha_2} \alpha_2 \int_{r}^{\infty} \delta(s) s^{\alpha_2} ds
= 1 + w(r) r^{-\alpha_2} \alpha_2 \int_{r}^{\infty} \delta(s) s^{\alpha_2} ds.
\]

Thus
\[
\int_{|y| \leq 1} |y|^{\alpha_1} \bar{\pi}(dy) + \int_{|y| > 1} |y|^{\alpha_2} \bar{\pi}(dy)
= w(r) r^{-\alpha_1} \alpha_1 \int_{0}^{r} w(s)^{-1} s^{\alpha_1} ds + w(r) r^{-\alpha_2} \alpha_2 \int_{r}^{\infty} w(s)^{-1} s^{\alpha_2} ds
= I_1 + I_2
\]

By Lemma 3 there is \( C \) so that
\[
I_2 = w(r) r^{-\alpha_2} \alpha_2 \int_{r}^{\infty} w(s)^{-1} s^{\alpha_2} ds \leq C, r \geq 1.
\]

By Lemma 2 there is \( C \) so that
\[
w(r) r^{-\alpha_2} \alpha_2 \int_{r}^{1} w(s)^{-1} s^{\alpha_2} ds \leq C, r \in (0,1).
\]
Hence there is $C$ so that $I_2 \leq C$ for all $r > 0$. Similarly, using Lemmas 3, 4 we estimate $I_1$.

Remark 4. In particular, if $w = w_\nu$ satisfies assumption $A$, then we may choose in Lemma 3 $\alpha_1, \alpha_2$ so that

(i) $\alpha_1, \alpha_2 \in (0, 1)$ if $\sigma \in (0, 1)$; (ii) $\alpha_1, \alpha_2 \in (1, 2)$ if $\sigma \in (1, 2)$; (iii) $\alpha_1 \in (1, 2]$ and $\alpha_2 \in [0, 1)$ if $\sigma = 1$.

Lemma 5. Let $\nu \in \mathfrak{F}, w = w_\nu (r), r > 0$, be a continuous O-RV function at zero and infinity with indices $p_1, q_1, p_2, q_2$ defined in (2.3), (2.4), and $p_1, p_2 > 0$. Let

$$a (r) = \inf \{ t > 0 : w (t) \geq r \}, r > 0.$$  

Then

(i) $w (a (t)) = t, t > 0$, and

$$a (w (t) - ) \leq t \leq a (w (t) +), t > 0.$$  

(ii) $a$ is O-RV at zero and infinity with lower indices $p, \bar{p}$ and upper indices $q, \bar{q}$ respectively so that

$$\frac{1}{q_1} \leq p \leq q \leq \frac{1}{p_1},$$

$$\frac{1}{q_2} \leq \bar{p} \leq \bar{q} \leq \frac{1}{p_2}.$$  

Proof. (i) follow easily from the definitions,

(ii) By Theorem 3 in [1], for any $\alpha \in (0, p_1)$ there is $C > 0$ so that

$$\frac{w (x)}{x^\alpha} \leq C \frac{w (y)}{y^\alpha}, 0 < x \leq y \leq 1.$$  

Hence

$$\frac{a (y)}{y^{\bar{p}}} \leq C \frac{a (x)}{x^{\bar{p}}}, 0 < x \leq y \leq 1,$$

and, by Karamata characterization (1.7) in [1] and Theorem 3 in [1], $a$ is O-RV at zero with upper index,

$$q \leq \frac{1}{p_1}.$$  

Similarly we find that the lower index at zero $p \geq \frac{1}{q_1}$, and determine that $a$ is O-RV at infinity with indices $\bar{p} \leq \bar{q}$ so that

$$\frac{1}{q_2} \leq \bar{p} \leq \bar{q} \leq \frac{1}{p_2}.$$  

The following claim is an obvious consequence of Lemmas 2, 5.
Corollary 1. Let $\nu \in \mathfrak{A}^\sigma, w = w_\nu(r), r > 0$, be a continuous O-RV function at zero and infinity with indices $p_1, q_1, p_2, q_2$ defined in (2.3), (2.4), and $p_1, p_2 > 0$. Let

$$a(r) = \inf \{t > 0: w(t) \geq r\}, r > 0.$$  

(i) For any $\beta > 0$ and $\tau < -\frac{\beta}{q_1} \wedge \frac{\beta}{q_2}$ there is $C > 0$ such that

$$\int_0^r t^{-\tau} a(t)^{\beta} \frac{dt}{t} \leq Cr^{-\tau} a(r)^\beta, r > 0,$$

$$\lim_{r \to 0} r^{-\tau} a(r)^\beta = 0, \lim_{r \to \infty} r^{-\tau} a(r)^\beta = \infty,$$

and for any $\beta < 0, \tau > (\frac{-\beta}{p_1}) \wedge (\frac{-\beta}{p_2})$ there is $C > 0$ such that

$$\int_0^r t^\tau a(t)^{\beta} \frac{dt}{t} \leq Cr^\tau a(r)^\beta, r > 0,$$

$$\lim_{r \to 0} r^\tau a(r)^\beta = 0, \lim_{r \to \infty} r^\tau a(r)^\beta = \infty.$$

(ii) For any $\gamma > 0$ and $\tau > \frac{\gamma}{p_1} \vee \frac{\gamma}{p_2}$ there is $C > 0$ such that

$$\int_r^\infty t^{-\tau} a(t)^{\gamma} \frac{dt}{t} \leq Cr^{-\tau} a(r)^\gamma, r > 0,$$

$$\lim_{r \to 0} r^{-\tau} a(r)^\gamma = \infty, \lim_{r \to \infty} r^{-\tau} a(r)^\gamma = 0,$$

and for any $\gamma < 0$ and $\tau < (\frac{-\gamma}{q_1}) \wedge (\frac{-\gamma}{q_2})$ there is $C > 0$ such that

$$\int_r^\infty t^\tau a(t)^{\gamma} \frac{dt}{t} \leq Cr^\tau a(r)^\gamma, r > 0,$$

$$\lim_{r \to 0} r^\tau a(r)^\gamma = \infty, \lim_{r \to \infty} r^\tau a(r)^\gamma = 0.$$

3.2. Estimates for probability density. In this section we derive some estimates of probability density of $Z_t^\nu$ (see below for detailed description), these preliminary estimates will be used in verifying Hörmander condition (see [14]) and stochastic Hörmander condition (see [11]) to derive apriori estimates.

Let $\nu \in \mathfrak{A}^\sigma$ and $p(dt, dy)$ be a Poisson point measure on $[0, \infty) \times \mathbb{R}^d_0$ such that $\mathbb{E}p(dt, dy) = \nu(dy) dt$. Let $q(dt, dy) = p(dt, dy) - \nu(dy) dt$. We associate to $L^\nu$ the stochastic process with independent increments

$$Z_t = Z_t^\nu = \int_0^t \int \chi_\sigma(y)yq(ds, dy) + \int_0^t (1 - \chi_\sigma(y))yp(ds, dy), t \geq 0.$$  

By Ito formula,

$$\mathbb{E}e^{i2\pi \xi \cdot Z_t^\nu} = \exp \{\psi^\nu(\xi) t\}, t \geq 0, \xi \in \mathbb{R}^d,$$

where

$$\psi^\nu(\xi) := \int \left[ e^{i2\pi \xi y} - 1 - i2\pi \chi_\sigma(y) \cdot \xi \right]\nu(dy).$$
For $R > 0$, let $Z^R_t = Z^R_t, t > 0$ be the stochastic process with independent increments associated with $\tilde{\nu}_R = w_\nu (R) \nu_R$, i.e.,

$$E e^{i2\pi \xi \cdot Z^R_t} = \exp \{ \psi^{R,0}(\xi) t \}$$

with

$$\psi^{R,0}(\xi) = \int \left[ e^{i2\pi \xi \cdot y} - 1 - i2\pi \chi_\alpha(y) \xi \cdot y \right] \tilde{\nu}_R (dy), \xi \in \mathbb{R}^d.$$ 

Note $Z^R_t = Z^\nu_t$ and $R^{-1} Z^\nu_{\omega_\nu(R)t}, t > 0$, have the same distribution. For $R > 0$, consider Levy measures $\nu^{R,0}(dy) = \chi_{\{ |y| \leq 1 \}} \tilde{\nu}_R (dy)$, i.e.,

$$\int \chi_\Gamma(y) \nu^{R,0}(dy) = \int_{|y| \leq 1} \chi_\Gamma(y) \tilde{\nu}_R (dy) = w_\nu (R) \int_{|y| \leq 1} \chi_\Gamma(y/R) \nu (dy), \Gamma \in \mathcal{B}_0 \left( \mathbb{R}^d \right).$$

Let $\eta = \eta_0^R$ be a random variable with characteristic function $\exp \{ \psi^{R,0}(\xi) \}$ given below, denote $\hat{\xi} = \xi / |\xi|, \xi \in \mathbb{R}^d$,

$$\psi^{R,0}(\xi) = \int_{|y| \leq 1} \left[ e^{i2\pi \hat{\xi} \cdot y} - 1 - i\chi_\alpha(y) \hat{\xi} \cdot y \right] \tilde{\nu}_R (dy)$$

$$= \int_{|y| \leq 1} \left[ e^{i2\pi \hat{\xi} \cdot y} - 1 - i\chi_\alpha(y) \hat{\xi} \cdot y |\xi| \right] \tilde{\nu}_R (dy)$$

$$= \frac{w(R)}{w(R |\xi|^{-1})} \int_{|y| \leq |\xi|} \left[ e^{i2\pi \hat{\xi} \cdot y} - 1 - i\chi_\alpha(y) \hat{\xi} \cdot y \right] \tilde{\nu}_R (dy). \quad (3.3)$$

**Lemma 6.** Let $\nu \in \mathfrak{A}^\sigma$, $w = w_\nu$ be an O-RV function and $A, B$ hold. Then

(i) $\Re \psi^{R,0}(\xi) \leq -c |\xi|^c , |\xi| \geq 1,$

with some $c, \kappa > 0$ independent of $R$.

(ii) $\eta = \eta_0^R$ has a pdf $p_{R,0}(x), x \in \mathbb{R}^d$, such that for any multiindex $\beta \in \mathbb{N}_0^d$, and a positive integer $n \geq 0$, then there exists $C = C(\beta, \nu) > 0$ such that

$$\sup_x \left| \partial^\beta p_{R,0}(x) \right| + \int (1 + |x|^2)^n \left| \partial^\beta p_{R,0}(x) \right| dx \leq C, R > 0.$$ 

**Proof.** (i) Let $\alpha_2 \in (0, \alpha_1 \nu \wedge \alpha_2 \nu)$. By Lemma [9] there is $C > 0$ so that

$$\frac{w(R)}{w(R |\xi|^{-1})} \geq C |\xi|^{\alpha_2}, R > 0, |\xi| \geq 1.$$ 

Hence, according to (3.3), for $|\xi| \geq 1, \hat{\xi} = \xi / |\xi|,$

$$\Re \psi^{R,0}(\xi) \leq c |\xi|^{\alpha_2} \int_{|y| \leq 1/8} \left[ \cos \left( 2\pi \hat{\xi} \cdot y \right) - 1 \right] \tilde{\nu}_R (dy)$$

$$\leq -c |\xi|^{\alpha_2} \inf_{R \in (0, \infty), |\xi| = 1} \int_{|y| \leq 1} |\hat{\xi} \cdot y|^2 \tilde{\nu}_R (dy) = -c_0 |\xi|^{\alpha_2},$$
where $\tilde{\nu}$

We have

Moreover, by (i), for any multiindex $\beta \in \mathbb{N}_0^d$,

is a bounded continuous function. The function $(1 + |x|^2)^n \partial^\beta p_{R,0}$ is integrable if

is bounded for all $j, k, \ldots, l \leq d + 1$. Since $\partial^\mu \psi_{R,0}(\xi)$ is bounded for $|\mu| \geq 2$ and

with $\zeta(\xi) = \int_{|y| \leq 1} \chi_{\sigma}(y) |y| \left( [(|\xi|, |y|) \wedge 1] \bar{\nu}(dy) \right)$. The boundedness follows from (i) and Lemma 4 (see Remark 3).

\begin{lemma}
Let $\nu \in \mathfrak{M}_c$, $w = w_\nu$ is an O-RV function and $A, B$ hold.

Then for $R > 0$, $Z^R_1$ has a bounded continuous probability density of the form

where $P_R$ is a probability distribution. Moreover, for any $0 < \alpha_2 < p^{w_\nu} \wedge p^{w_\nu}$ and multiindex $\beta \in \mathbb{N}_0^d$, there is $C = C(\beta, \alpha_2, \nu) > 0$ such that

\begin{equation}
\sup_x \left| \partial^\beta p_R(1, x) \right| + \int (1 + |x|^\alpha_2) \left| D^\beta p_R(1, x) \right| dx \leq C.
\end{equation}

\end{lemma}

\begin{proof}
We have

where $\tilde{\nu}_{R,0}(dy) = \chi_{|y| \leq 1} \bar{\nu}_R(dy)$ and hence,

Denote $\eta_{R,0}^R$ and $\eta_{R,2}^R$ to be independent random variables with characteristic exponent $\exp \left\{ \psi_{R,0}(\xi) \right\}$ and $\exp \left\{ \psi_{R,2}(\xi) \right\}$ respectively. Obviously

and

(ii) Since (3.5) holds, by Proposition I.2.5 in [17], $\eta = \eta_0^R$ has a continuous bounded density

Moreover, by (i), for any multiindex $\beta \in \mathbb{N}_0^d$,

\begin{align}
\partial^\beta p_{R,0}(x) &= \int e^{-i2\pi x \cdot \xi} \partial^\beta \psi_{R,0}(\xi) d\xi, x \in \mathbb{R}^d,
\end{align}

is integrable if

is bounded for all $j, k, \ldots, l \leq d + 1$. Since $\partial^\mu \psi_{R,0}(\xi)$ is bounded for $|\mu| \geq 2$ and

with $\zeta(\xi) = \int_{|y| \leq 1} \chi_{\sigma}(y) |y| \left( [(|\xi|, |y|) \wedge 1] \bar{\nu}(dy) \right)$. The boundedness follows from (i) and Lemma 4 (see Remark 3).

\begin{lemma}
Let $\nu \in \mathfrak{M}_c$, $w = w_\nu$ is an O-RV function and $A, B$ hold.

Then for $R > 0$, $Z^R_1$ has a bounded continuous probability density of the form

where $P_R$ is a probability distribution. Moreover, for any $0 < \alpha_2 < p^{w_\nu} \wedge p^{w_\nu}$ and multiindex $\beta \in \mathbb{N}_0^d$, there is $C = C(\beta, \alpha_2, \nu) > 0$ such that

\begin{equation}
\sup_x \left| \partial^\beta p_R(1, x) \right| + \int (1 + |x|^\alpha_2) \left| D^\beta p_R(1, x) \right| dx \leq C.
\end{equation}

\end{lemma}

\begin{proof}
We have

where $\tilde{\nu}_{R,0}(dy) = \chi_{|y| \leq 1} \bar{\nu}_R(dy)$ and hence,

Denote $\eta_{R,0}^R$ and $\eta_{R,2}^R$ to be independent random variables with characteristic exponent $\exp \left\{ \psi_{R,0}(\xi) \right\}$ and $\exp \left\{ \psi_{R,2}(\xi) \right\}$ respectively. Obviously

the distribution of $Z^R_t$ coincides with the distribution of the sum $\eta^R_0 + \eta^R_2$. Therefore,

\begin{equation}
(3.10) \quad p^R(1, x) = \int p_{R,0}(x - y) \, P_R(dy)
\end{equation}

where $P_R(dy)$ is the probability distribution of $\eta^R_2$. It is clear from (3.10) that for any multiindex $\beta \in \mathbb{N}_0^d$,

$$\partial^\beta p^R(1, x) = \int \partial^\beta p_{R,0}(x - y) \, P_R(dy)$$

and from Lemma 6

$$\int \left| \partial^\beta p^R(1, x) \right| \, dx \leq C,$$

and

$$\sup_x \left| \partial^\beta p^R(1, x) \right| \leq C.$$

Moreover, using Lemma 4, and following the argument of Lemma 10 of [15], one derives easily the estimate (3.8).

Lemma 8. (see Corollary 4 of [15]) Let $\nu \in A_\sigma$, $w = w_\nu$ be an O-RV function and $A$, $B$ hold. Let

$\alpha_1 > q^w_1 \vee q^w_2$, $0 < \alpha_2 < p^w_1 \wedge p^w_2$.

and

$\alpha_2 > 1$ if $\sigma \in (1, 2)$,

$\alpha_1 \leq 1$ if $\sigma \in (0, 1), \alpha_1 \leq 2$ if $\sigma \in [1, 2)$.

Let $\pi \in A_\sigma_{\text{sign}}$ and assume that

$$\int_{|y| \leq 1} |y|^{\alpha_1} d|\pi|_R + \int_{|y| > 1} |y|^{\alpha_2} d|\pi|_R \leq M, R > 0.$$ 

Then for any multiindex $k \in \mathbb{N}_0^d$ there is $C = C(k, \nu) > 0$ such that

$$\int (1 + |x|^{\alpha_2}) \left| D^k L^{\tilde{\pi}}_R p^R(1, x) \right| \, dx \leq CM,$$

and there is $C = C(\nu) > 0$ such that

$$\int (1 + |x|^{\alpha_2}) \left| L^{\tilde{\pi}}_R L^{\tilde{\nu}}_R p^R(1, x) \right| \, dx \leq CM.$$
Lemma 9. Let $\nu \in \mathfrak{A}^\sigma, w = w_\nu$ be a continuous $O$-RV function and $A, B$ hold. Let

$$\alpha_1 > q_1^w \lor q_2^w, 0 < \alpha_2 < p_1^w \land p_2^w,$$

and

$$\alpha_2 > 1 \text{ if } \sigma \in (1, 2),$$
$$\alpha_1 \leq 1 \text{ if } \sigma \in (0, 1), \alpha_1 \leq 2 \text{ if } \sigma \in [1, 2).$$

Let $\pi \in \mathfrak{A}_{sign}$ and assume that

$$\int_{|y| \leq 1} |y|^{\alpha_1} d|\mu|_R + \int_{|y| > 1} |y|^{\alpha_2} d|\mu|_R \leq M, R > 0.$$

Denote $a (t) = \inf \{ r : w_\nu (r) \geq t \}, t > 0.$

(i) For any multiindex $k \in \mathbb{N}_0^d$ and $\beta \in [0, \alpha_2], \text{ there is } C = C (k, \nu, \beta) > 0 \text{ such that}$

$$\int_{|z| > c} |L^\pi D^k p^\nu (t, z)| dz \leq CM t^{-1} a (t)^{\beta - |k|} c^{-\beta},$$
$$\int |L^\pi D^k p^\nu (t, z)| dz \leq CM t^{-1} a (t)^{-|k|},$$

(ii) There is $C = C (\nu) > 0$ such that

$$\int_{\mathbb{R}^d} |L^\pi p^\nu (t, x) - L^\pi p^\nu (t, y)| dx \leq CM \frac{|y|}{ta (t)}, t > 0, y \in \mathbb{R}^d,$$

(iii) There is $C = C (\nu) > 0$ such that

$$\int_0^\infty \int \left| L^\pi p^\nu (t - s, x) - L^\pi p^\nu (t, x) \right| dx dt \leq CM, |s| \leq b < \infty.$$

3.3. Representation of fractional operator and some density estimates. In order to deal with the stochastic term we need some finer estimates of probability density. The fractional operator is defined in the following way. Let $\mu \in \mathfrak{A}_{sym}^\sigma = \{ \eta \in \mathfrak{A}^\sigma : \eta \text{ is symmetric, } \eta = \eta_{sym} \}.$ Then for $\delta \in (0, 1)$ and $f \in \mathcal{S} (\mathbb{R}^d),$ we have

$$- (-\psi^\mu (\xi))^{\delta} \hat{f} (\xi) = c_3 \int_0^\infty t^{-\delta} [\exp (\psi^\mu (\xi) t) - 1] \frac{dt}{t} \hat{f} (\xi), \xi \in \mathbb{R}^d,$$

and define

$$(3.11) \quad L^{\mu, \delta} f (x) := \mathcal{F}^{-1} \left[ - (-\psi^\mu (\xi))^{\delta} \hat{f} \right] (x)$$
$$= c_3 \mathcal{E} \int_0^\infty t^{-\delta} \left[ f (x + Z^\mu_t) - f (x) \right] \frac{dt}{t}, x \in \mathbb{R}^d.$$
Lemma 10. Let $\mu \in \mathfrak{A}_\text{sym}^\sigma$, $\delta \in (0, 1)$. Let $\nu \in \mathfrak{A}^\sigma$, $w = w_\nu$ be a continuous O-RV function and $A$, $B$ hold. Assume

$$\alpha_1 > q_1^w \vee q_2^w, 0 < \alpha_2 < p_1^w \wedge p_2^w;$$

$$\alpha_2 > 1 \text{ if } \sigma \in (1, 2),$$

$$\alpha_1 \leq 1 \text{ if } \sigma \in (0, 1), \alpha_1 \leq 2 \text{ if } \sigma \in [1, 2),$$

and

$$\int_{|y| \leq 1} |y|^{\alpha_1} \, d\mu_R + \int_{|y| > 1} |y|^{\alpha_2} \, d\mu_R \leq M, R > 0.$$  

Let $p^\nu(t, x), x \in \mathbb{R}^d$, be the pdf of $Z^\nu + t > 0$ and $a(t) = \inf \{ r : w(r) \geq t \}, t > 0$.

(i) For any $p \geq 1$, and $\epsilon > 0$ there is $C_\epsilon > 0$ such that

$$\left| L^{\mu, \delta} f \right|_{L_p(\mathbb{R}^d)} \leq \epsilon \left| L^\mu f \right|_{L_p(\mathbb{R}^d)} + C_\epsilon |f|_{L_p(\mathbb{R}^d)}, f \in \mathcal{S}(\mathbb{R}^d).$$

(ii) There is $C = C(\nu) > 0$ such that

$$\int_{\mathbb{R}^d} \left| L^{\mu, \delta} p^\nu(t, x) \right| \, dx \leq CM \frac{|y|}{p^a(t)}, t > 0, y \in \mathbb{R}^d,$$

(iii) There is $C = C(\nu) > 0$ such that

$$\left( \int_{2b}^{\infty} \left( \int_{2b} \left| L^{\mu, \delta} p^\nu(t - s, x) - L^{\mu, \delta} p^\nu(t, x) \right| \, dx \right)^2 \, dt \right) \leq CM |s| \leq b < \infty.$$

(iv) For any multiindex $k \in \mathbb{N}^d_0$ and $\beta \in [0, \delta \alpha_2)$ there is $C = C(k, \nu, \beta) > 0$ such that

$$\int_{|x| > \epsilon} \left| L^{\mu, \delta} D^k p^\nu(t, x) \right| \, dx \leq CM t^{-\delta} a(t)^{-|k|} c^{-\beta},$$

$$\int \left| L^{\mu, \delta} D^k p^\nu(t, x) \right| \, dx \leq CM t^{-\delta} a(t)^{-|k|}.$$  

For the proof of Lemma 10 we will need the following Lemmas 11, 12.

Lemma 11. Let $\delta \in (0, 1)$, $\mu \in \mathfrak{A}_\text{sym}^\sigma$, and $\pi \in \mathfrak{A}_\text{sign}^\sigma$. Let $\nu \in \mathfrak{A}, w = w_\nu$ be a continuous O-RV function and $A$, $B$ hold. Then

$$p^\nu(t, x) = a(t)^{-d} p^{\pi a(t)}(1, \pi a(t)^{-1}), x \in \mathbb{R}^d, t > 0;$$

$$L^{\mu, \delta} p^\nu(t, x) = \frac{1}{b^\delta} a(t)^{-d} \left( L^{\pi a(t)} \delta p^{\pi a(t)}(1, \pi a(t)^{-1}) \right), x \in \mathbb{R}^d, t > 0;$$

$$L^\pi L^{\mu, \delta} p^\nu(t, x) = \frac{1}{t^{1+\delta}} a(t)^{-d} \left( L^{\pi a(t)} L^{\pi a(t)} \delta p^{\pi a(t)}(1, \pi a(t)^{-1}) \right), x \in \mathbb{R}^d, t > 0;$$

where $a(t) = \inf \{ r \geq 0 : \omega(r) \geq t \}, t > 0.
Proof. Indeed, by Lemma 7 for each $t > 0$ and $r > 0$, the density $p_{r,a(t)}(r, x), x \in \mathbb{R}^d$, is infinitely differentiable in $x$, all derivatives are bounded and integrable. Obviously,

$$\exp \{ \psi^v(\xi) t \} = \exp \{ \psi^v(a(t) \xi) \}, t > 0, \xi \in \mathbb{R}^d,$$

and

$$(-\psi^v(\xi))^\delta \exp \{ \psi^v(\xi) t \}
= \frac{1}{\phi^v} (-\psi^v(a(t) \xi))^\delta \exp \{ \psi^v(a(t) \xi) \}, t > 0, \xi \in \mathbb{R}^d.$$

We derive the first two equalities by taking Fourier inverse. Similarly, the third equality can be derived.

Lemma 12. Let $\mu, \nu \in \mathbb{R}^d$ satisfy assumptions of Lemma 10, $\delta \in (0, 1)$.

a) For any $p \geq 1$, and $\varepsilon > 0$ there is $C_{\varepsilon} > 0$ such that

$$\left| L^{\mu, \delta} f \right|_{L_p(\mathbb{R}^d)} \leq \varepsilon \left| L^{\mu} f \right|_{L_p(\mathbb{R}^d)} + C_{\varepsilon} \left| f \right|_{L_p(\mathbb{R}^d)}, f \in \mathcal{S} \left( \mathbb{R}^d \right).$$

b) Let $p^R(t, x) = p^R(t, x), x \in \mathbb{R}^d$, be the pdf of $Z^R(t), t > 0, R > 0$. Then for each multiindex $k \in \mathbb{N}^d_0$, and $\beta \in [0, \delta_0]$ there is $C = C(k, \nu, \beta) > 0$ such that,

$$\int (1 + |x|^\beta) \left| D^k L^{\mu, \delta} p^R (1, x) \right| dx \leq CM,$$

$$\int (1 + |x|^\beta) \left| L^{\mu, \delta} L^{\nu, \beta} p^R (1, x) \right| dx \leq CM.$$

Proof. Indeed for any $a > 0, f \in \mathcal{S} \left( \mathbb{R}^d \right), x \in \mathbb{R}^d$, by Ito formula and (3.11),

$$(3.13) \quad L^{\mu, \delta} f(x) = cE \int_0^a t^{-\delta} \int_0^t L^{\mu} f(x + Z^\mu_t) dt \frac{dt}{t}$$

$$+ cE \int_0^\infty t^{-\delta} \left[ f(x + Z^\mu_t) - f(x) \right] dt \frac{dt}{t}.$$

The statement a) follows by Minkowski inequality.

By (3.13), for any multiindex $k$,

$$\int (1 + |x|^\beta) \left| L^{\mu, \delta} L^{\nu, \beta} D^k p^R (1, x) \right| dx$$

$$\leq CE \int_0^1 t^{-\delta} \int_0^t \int (1 + |x|^\beta) \left| L^{\nu, \beta} D^k p^R (1, x + Z^\mu_t) \right| dx dt \frac{dt}{t}$$

$$+ CE \int_1^\infty t^{-\delta} \int (1 + |x|^\beta) \left[ \left| D^k p^R (1, x + Z^\mu_t) \right] + \left| D^k p^R (1, x) \right| \right] dx dt \frac{dt}{t}$$

$$= A_1 + A_2.$$
Now, by Lemma 8 and Lemma 17 in [15],

\[ A_1 \leq C \int_0^1 t^{-\delta} \int \left( 1 + |x|^\beta \right) |L^{\mu} D^k p^R (1, x)| \, dx \, dt + C \int_0^1 t^{-\delta} \int_0^t E \left( |Z^\mu_1|^\beta \right) dr \int \left| L^{\mu} D^k p^R (1, x) \right| \, dx \, \frac{dt}{t} \leq C, \]

and

\[ A_2 \leq C \int_1^{\infty} t^{-\delta} \int \left( 1 + |x|^\beta \right) \left| D^k p^R (1, x) \right| \, dx \, \frac{dt}{t} + C \int_1^{\infty} t^{-\delta} E \left( |Z^\mu_1|^\beta \right) \int \left| D^k p^R (1, x) \right| \, dx \, \frac{dt}{t} \leq C \left( 1 + \int_1^{\infty} t^{-\delta} \frac{\alpha}{t} \, dt \right) \leq C. \]

Similarly, the second inequality of part b) is proved. \( \square \)

3.3.1. Proof of Lemma 10. (i) is proved in Lemma 12 (a).

(ii) By Lemma 11 and Lemma 12,

\[ \int_{\mathbb{R}^d} \left| L^{\mu} \delta p^\nu (t, x - y) - L^{\mu} \delta p^\nu (t, x) \right| \, dx = \frac{1}{t^\delta} \int \left| \tilde{L}^{(\mu)}(t) \delta p^{(\nu)} (1, x - \frac{y}{a(t)}) \right| \, dx \]

\[ \leq \frac{1}{t^\delta} \int_0^1 \int \| \nabla \tilde{L}^{(\mu)}(t) \delta p^{(\nu)} (1, x - s \frac{y}{a(t)}) \| \frac{|y|}{a(t)} \, dx \, ds \]

\[ \leq C \frac{|y|}{t^\alpha (t)} \int \left| \tilde{L}^{(\mu)}(t) \delta \nabla p^{(\nu)} (1, x) \right| \, dx \leq CM \frac{|y|}{t^\alpha (t)}. \]

(iii) By Lemma 11 and Lemma 12

\[ \int_{2a}^{\infty} \left( \int |L^{\mu} \frac{1}{2} p^\nu (t - s, x) - L^{\mu} \frac{1}{2} p^\nu (t, x)| \, dx \right)^2 \, dt \leq \left( \int_{2a}^{\infty} \left( \int \int |L^{\mu} \frac{1}{2} p^\nu (t - s, x) - L^{\mu} \frac{1}{2} p^\nu (t, x)| \, dx \, dr \right)^2 \, dt \right) \leq C |s|^2 \int_{2a}^{\infty} \left( \int_0^1 \frac{dr}{(t - rs)^{1 + \frac{\delta}{2}}} \right)^2 \, dt \]

\[ \leq C |s|^2 \int_{2a}^{\infty} \frac{dt}{(t - s)^{\frac{1}{2}}} = C \int_{2a}^{\infty} \frac{1}{t} \, dt \leq C. \]
Indeed, by Lemma 11, Chebyshev inequality, and Lemma 12, 
\[
\int_{|x|>c} |L^{\mu,\delta} D^k p^n (t, x)| \, dx 
= \frac{1}{t^d a(t)^{d-k}} \int_{|x|>c} \left| L^{\hat{\mu}_0(t),\delta} D^k p^{\hat{\nu}_0(t)} \left(1, \frac{x}{a(t)} \right) \right| \, dx 
\leq \frac{a(t)^{\beta-k} c^{-\beta}}{t^d} \int |x|^{\beta} \left| L^{\hat{\mu}_0(t),\delta} D^k p^{\hat{\nu}_0(t)} (1, x) \right| \, dx \leq CM a(t)^{\beta-k} c^{-\beta}. 
\]
Similarly, we derive the second estimate of the claim.

4. Equivalent norms of function spaces

In this section, we discuss a characterization of Bessel potential spaces and Besov spaces.

**Lemma 13.** Let \( w \) be a non-decreasing O-RV function at zero and infinity, with \( p_1^n, p_2^n > 0 \). Let \( \pi \in \mathcal{M}^\sigma \) and define \( \tilde{\pi}_R (dy) = w(R) \pi (R dy) \), \( R > 0 \).

a) Assume there is \( N_2 > 0 \) so that
\[
\begin{align*}
& \int (|y| \wedge 1) \tilde{\pi}_R (dy) \leq N_2 \text{ if } \sigma \in (0, 1), \\
& \int (|y|^2 \wedge 1) \tilde{\pi}_R (dy) \leq N_2 \text{ if } \sigma = 1, \\
& \int_{|y| \leq 1} |y|^2 \tilde{\pi}_R (dy) + \int_{|y| > 1} |y| \tilde{\pi}_R (dy) \leq N_2 \text{ if } \sigma \in (1, 2)
\end{align*}
\]
for any \( R > 0 \). Then there is a constant \( C_1 \) so that for all \( \xi \in \mathbb{R}^d \),
\[
\begin{align*}
& \int \left[ 1 - \cos (2\pi \xi y) \right] \pi (dy) \leq C_1 N_2 w \left( |\xi|^{-1} \right)^{-1}, \\
& \int \left| \sin (2\pi \xi \cdot y) - 2\pi \chi_\sigma (y) \xi \cdot y \right| \pi (dy) \leq C_1 N_2 w \left( |\xi|^{-1} \right)^{-1},
\end{align*}
\]
assuming \( w \left( |\xi|^{-1} \right)^{-1} = 0 \) if \( \xi = 0 \).

b) Let
\[
\begin{align*}
& \inf_{R \in (0, \infty), |\xi| = 1} \int_{|y| \leq 1} \left| \frac{\xi}{y} \right|^2 \tilde{\pi}_R (dy) = c_0 > 0.
\end{align*}
\]
Then there is a constant \( c_2 = c_2 (w, c_0) > 0 \) such that
\[
\int \left[ 1 - \cos (2\pi \xi y) \right] \pi (dy) \geq c_2 w \left( |\xi|^{-1} \right)^{-1}
\]
for all \( \xi \in \mathbb{R}^d \), assuming \( w \left( |\xi|^{-1} \right)^{-1} = 0 \) if \( \xi = 0 \).
Proof. The following simple estimates hold:

\[(4.3) \quad |\sin x - x| \leq \frac{|x|^3}{6}, 1 - \cos x \leq \frac{1}{2}x^2, x \in \mathbb{R},\]

\[1 - \cos x \geq \frac{x^2}{\pi} \text{ if } |x| \leq \pi/2.\]

Part a) was proved in Lemma 7 of [14].

b) By (4.3), for all $\xi \in \mathbb{R}^d$,

\[
\int [1 - \cos (2\pi \xi \cdot y)] \pi (dy) = \int [1 - \cos (2\pi \hat{\xi} \cdot y)] \pi_{\xi}^{-1} (dy) \geq \int_{|y| \leq 1/2} 4\pi \left| \hat{\xi} \cdot y \right|^2 \pi_{\xi}^{-1} (dy)
\]

\[= 4^{-1} \int_{|y| \leq 1} \pi \left( \hat{\xi} \cdot 4y \right)^2 \pi_{\xi}^{-1} (dy) = 4^{-1}w \left( |4\xi|^{-1} \right)^{-1} \int_{|y| \leq 1} \pi \left| \hat{\xi} \cdot y \right|^2 \pi_{|\xi|}^{-1} (dy)
\]

\[\geq cw \left( |4\xi|^{-1} \right)^{-1} \geq cw \left( |\xi|^{-1} \right)^{-1}.
\]

\[\square\]

Lemma 14. Let $\nu \in \mathcal{X}$, $w = w_\nu$ be an O-RV function and $A$, $B$ hold. Let $\zeta, \zeta_0 \in C_0^\infty (\mathbb{R}^d)$ be such that $0 \notin \text{supp} (\zeta)$. Let $\tilde{\zeta} = \mathcal{F}^{-1} \zeta$, $\tilde{\zeta}_0 = \mathcal{F}^{-1} \zeta_0$, and for $R > 0$,

\[
H^R (t, x) = E \hat{\zeta} (x + Z_t^R), t \geq 0, x \in \mathbb{R}^d,
\]

\[
H_0^R (t, x) = E \hat{\zeta}_0 (x + Z_t^R), t \geq 0, x \in \mathbb{R}^d.
\]

(i) For any $0 < \alpha_2 < p_1^{\alpha_2} \wedge p_2^{\alpha_2}$, there are constants $C_0, C_1, C_2 > 0$ independent of $R$ such that

\[
\int (1 + |x|^{\alpha_2}) |H^R (t, x)| \, dx \leq C_1 e^{-C_2 t}, t \geq 0,
\]

\[
\int |x|^{\alpha_2} |H_0^R (t, x)| \, dx \leq C_0 (1 + t), t \geq 0,
\]

\[
\int |H_0^R (t, x)| \, dx \leq C_0, t \geq 0.
\]

(ii) There are constants $C_1, C_2 > 0$ independent of $R$ so that for $y \in \mathbb{R}^d$,

\[
\int |H^R (t, x + y) - H^R (t, x)| \, dx \leq C_1 |y| e^{-C_2 t},
\]

\[
\int |H_0^R (t, x + y) - H_0^R (t, x)| \, dx \leq |y| \int \left| \nabla \hat{\zeta}_0 (x) \right| \, dx.
\]

Proof. (i) Note that

\[
\mathcal{F}H^R (t, \xi) = \exp \{ \psi^{p_R} (\xi) t \} \zeta (\xi), \xi \in \mathbb{R}^d.
\]
Following Lemma 2 of [15] (see also Corollary 2 of [13]). We choose $\epsilon > 0$ so that $\text{supp} \left( \zeta \right) \subset \{ \xi : |\xi| \leq \epsilon^{-1} \}$. Let $\tilde{\nu}_{R,\epsilon} \left( dy \right) = \chi_{\{|y| \leq \epsilon\}} \tilde{\nu}_R \left( dy \right), R \in (0,1]$. Then for $\xi \in \text{supp} \left( \zeta \right), \ |y| \leq \epsilon$ and $R \in (0,1]$,

$$1 - \cos \left( \xi \cdot y \right) \geq \frac{1}{\pi} |\xi \cdot y|^2 = \frac{|\hat{\xi}|^2}{\pi} |\hat{\xi} \cdot y|^2, \quad \hat{\xi} = \xi / |\xi|,$$

and for some $c_0 = c_0 \left( \epsilon \right)$, applying Lemma 1,

$$-\text{Re} \psi^{\tilde{\nu}_{R,\epsilon}} \left( \xi \right) = \int_{|y| \leq \epsilon} \left[ 1 - \cos \left( \xi \cdot y \right) \right] \tilde{\nu}_{R,\epsilon} \left( dy \right)$$

(4.4)

$$\geq \frac{|\xi|^2}{\pi} \int_{|y| \leq \epsilon} |\hat{\xi} \cdot y|^2 \tilde{\nu}_R \left( dy \right)$$

$$= \frac{|\xi|^2}{\pi} \int_{|y| \leq 1} \epsilon^2 |\hat{\xi} \cdot y|^2 \frac{w(R)}{w(R\epsilon)} \tilde{\nu}_R \left( dy \right) \geq c_0 |\xi|^2$$

for all $\xi \in \mathbb{R}^d$. Hence,

$$H^R(t,\cdot) = F \left( t, \cdot \right) * P_t,$$

where

$$F \left( t, x \right) = \mathcal{F}^{-1} \left[ \exp \left\{ \psi^{\tilde{\nu}_{R,\epsilon}} \right\} \zeta \left( \cdot \right) \right] \left( x \right) = \mathbb{E}^{\tilde{\nu}_{R,\epsilon}} \left( x + \tilde{Z}_t^{\tilde{\nu}_{R,\epsilon}} \right), t \geq 0, x \in \mathbb{R}^d,$$

and $P_t \left( dy \right)$ is the distribution of $\tilde{Z}_t^{\tilde{\nu}_{R,\epsilon}}$. By Plancherel for any multiindex $\gamma \in \mathbb{N}_0^d$ and [13],

$$\int |x^\gamma F \left( t, x \right)|^2 \, dx \leq C \int |D^\gamma \left[ \zeta \left( \xi \right) \exp \left\{ \psi^{\tilde{\nu}_{R,\epsilon}} \left( \xi \right) t \right\} \right]|^2 \, d\xi$$

$$\leq C_1 e^{-C_2 t}, t \geq 0.$$

By Cauchy-Schwarz inequality, with $d_0 = \left\lceil \frac{d}{2} \right\rceil + 1$,

$$\int \left( 1 + |x|^2 \right) |F \left( t, x \right)| \, dx$$

$$= \int \left( 1 + |x|^2 \right) (1 + |x|)^{-d_0} \, |F \left( t, x \right)| (1 + |x|)^{d_0} \, dx$$

$$\leq \left( \int (1 + |x|)^{-2d_0} \, dx \right)^{1/2} \left( \int (1 + |x|)^4 \, |F \left( t, x \right)|^2 (1 + |x|)^{2d_0} \, dx \right)^{1/2}$$

$$\leq C \left( \int F \left( t, x \right)^2 \left( 1 + |x|^2 \right)^{d_0 + 2}| \, dx \right)^{1/2} \leq C_1 \exp \left\{ -C_2 t \right\}, t \geq 0.$$

Let $0 < \alpha_2 < p_1 \wedge p_2$. By Lemma 1 and Lemma 17 of [15], there is $C > 0$ so that

$$\mathbb{E} \left[ \left| \tilde{Z}_t^{\tilde{\nu}_{R,\epsilon}} \right|^{\alpha_2} \right] = \int |y|^{\alpha_2} P_t \left( dy \right) \leq C \left( 1 + t \right), t \geq 0.$$
Hence there are constants $C_1, C_2$ so that
\[
\int (1 + |x|^{\alpha_2}) |H^R(t,x)| \, dx = \int (1 + |x|^{\alpha_2}) \left| \int F(t,x-y) \, P_t(dy) \right| \, dx
\leq \int \int (1 + |x-y|^{\alpha_2}) |F(t,x-y)| \, P_t(dy) \, dx
+ \int \int |y|^{\alpha_2} |F(t,x-y)| \, P_t(dy) \, dx
\leq C_1 e^{-C_2t}, \quad t \geq 0,
\]
and
\[
\int |x|^{\alpha_2} |H^R_0(t,x)| \, dx = \int |x|^{\alpha_2} \left| \mathbb{E} \tilde{\zeta}_0(x + Z^R_t) \right| \, dx
\leq \mathbb{E} \int |x + Z^R_t|^{\alpha_2} \left| \tilde{\zeta}_0(x + Z^R_t) \right| \, dx + \mathbb{E} \left[ |Z^R_t|^{\alpha_2} \right] \int \left| \tilde{\zeta}_0(x) \right| \, dx
\leq C(1 + t).
\]
The last inequality is trivial.

(ii) Similarly as in part (i), for $y \in \mathbb{R}^d$,
\[
\int |H^R(t,x+y) - H^R(t,x)| \, dx
= \int \int \int_0^1 \nabla F(t,x + sy - z) \cdot ydsP_t(ds) \, dx
\leq |y| \int |DF(t,x)| \, dx \leq C_1 |y| e^{-C_2t}, \quad t > 0,
\]
and directly
\[
\int \left| H^R_0(t,x+y) - H^R_0(t,x) \right| \, dx \leq |y| \int \left| \nabla \tilde{\zeta}_0(x) \right| \, dx.
\]

Let $V_r = L_r(U, \mathcal{U}, \Pi), \ r \geq 1$, the space of $r$–integrable measurable functions on $U$, and $V_0 = \mathbb{R}$. For brevity of notation we write
\[
B^{s}_{r,pp}(A) = B^{s}_{pp}(A; V_r), \quad \mathbb{B}^{s}_{r,pp}(A) = \mathbb{B}^{s}_{pp}(A; V_r),
H^{s}_{r,p}(A) = H^{s}_{p}(A; V_r), \quad \mathbb{H}^{s}_{r,p}(A) = \mathbb{H}^{s}_{p}(A; V_r),
L^{0}_{r,p}(A) = L^{0}_{r,p}(A), \quad \mathbb{L}^{0}_{r,p}(A) = \mathbb{H}^{0}_{r,p}(A),
\]
where $A = \mathbb{R}^d$ or $E$. We use the following equivalent norms of Besov spaces $B^{s}_{r,pp}(\mathbb{R}^d), \ r = 0, p,$ (see Proposition I below)
\[
|v|_{\tilde{B}^{s}_{r,pp}(\mathbb{R}^d)} = \left( \sum_{j=0}^{\infty} w(N^{-j})^{-sp} \int \left| \varphi_j * v \right|^{p}_{V_r} \, dx \right)^{1/p},
\]
where \( \varphi_j = \varphi_j^N, j \geq 0, \) is the system of functions defined in Remark \( \text{[1]} \). The equivalent norms of \( H^{s}_{r,p}(\mathbb{R}^d), r = 0,2, \) (see Proposition \( \text{[III]} \) below) are defined by

\[
|v|_{H^s_{r,p}(\mathbb{R}^d)} = |v|_{H^s_{r,p}(\mathbb{R}^d)} = \left( \sum_{j=0}^{\infty} |w(N^{-j})^{-s} \ast v|_{V_r}^p \right)^{1/2}.
\]

We define the equivalent norms of functions on \( E \) as well:

\[
|v|_{\tilde{B}^s_{p,q}(E)} = \left( \int_0^T |v(t)|_{\tilde{B}^s_{p,q}(\mathbb{R}^d)}^p dt \right)^{1/p},
\]

\[
|v|_{\tilde{H}^s_{r,p}(E)} = \left( \int_0^T |v(t)|_{\tilde{H}^s_{r,p}(\mathbb{R}^d)}^p dt \right)^{1/p}.
\]

For \( D = D_r(A) = B^s_{r,pp}(A) \) or \( H^s_{r,p}(A) = \mathbb{R}^d, E \), we consider corresponding equivalent norms on random function spaces \( \mathcal{D} = \mathcal{D}_r(A) = \mathbb{B}_{r,pp}(A) \) or \( \mathbb{H}^s_{r,p}(A) \):

\[
|v|_{\tilde{D}} = \left\{ \mathbb{E} \left( |v|_{\tilde{D}}^p \right) \right\}^{1/p}.
\]

Lemmas \( \text{[13]} \) \( \text{[14]} \) and \( \text{[H]} \) are key ingredients in proving the following characterization of our Bessel potential spaces and Besov spaces. The proof follows almost verbatim with obvious changes the corresponding proof in \( \text{[15]} \). Therefore we omit it, and simply state the result.

**Proposition 1.** Let \( \nu \in \mathfrak{A}, w = w_\nu \) be an O-RV function and \( A, B \) hold. Let \( s \in \mathbb{R}, p, q \in (1, \infty) \).

\[
(i) \quad \tilde{B}^s_{p,q}(\mathbb{R}^d) = B^s_{p,q}(\mathbb{R}^d) \quad \text{and the norms are equivalent}
\]

\[
(ii) \quad \tilde{H}^s_{p}(\mathbb{R}^d) = H^s_{p}(\mathbb{R}^d) \quad \text{and the norms are equivalent}
\]

\[
(iii) \quad \tilde{H}^s_{r,p}(\mathbb{R}^d; l_2) = H^s_{r,p}(\mathbb{R}^d; l_2) \quad \text{and the norms are equivalent}.
\]

Moreover, for all \( s, s' \in \mathbb{R}, J^s : A^s \to A^{s-s} \) is an isomorphism where \( A^s = B^s_{p,q}(\mathbb{R}^d), H^s_{r,p}(\mathbb{R}^d) \) or \( H^s_{r,p}(\mathbb{R}^d; l_2) \).

Let \( U_n \in \mathcal{U}, U_n \subseteq U_{n+1}, n \geq 1, \cup_n U_n = U \) and \( \Pi(U_n) < \infty, n \geq 1 \). We denote by \( \tilde{C}^\infty_{r,p}(E), 1 \leq p < \infty, \) the space of all \( \mathcal{R}(\mathbb{F}) \otimes \mathcal{B}(\mathbb{R}^d) \)-measurable \( V_r \)-valued random functions \( \Phi \) on \( E \) such that for every \( \gamma \in \mathbb{N}_0^d \)

\[
\mathbb{E} \int_0^T \sup_{x \in \mathbb{R}^d} |D^\gamma \Phi(t,x)|_{V_r}^p dt + \mathbb{E} \left[ |D^\gamma \Phi|_{L_p(E;V_r)}^p \right] < \infty,
\]

and \( \Phi = \Phi \chi_{U_n} \) for some \( n \) if \( r = 2, p \). Similarly we define the space \( \tilde{C}^\infty_{r,p}(\mathbb{R}^d) \) by replacing \( \mathcal{R}(\mathbb{F}) \) and \( E \) by \( \mathcal{F} \) and \( \mathbb{R}^d \) respectively in the definition of \( \tilde{C}^\infty_{r,p}(E) \).

Let \( \nu \in \mathfrak{A}, N > 1, w = w_\nu \) is a continuous O-RV function and \( A, B \) hold. We now discuss an approximating sequence of the input \( \Phi \), based on Proposition \( \text{[III]} \).
Lemma 15. Let $\nu \in \mathfrak{F}^\sigma, w = w_\nu$ be an O-RV function and $A, B$ hold.
Let $U_n \in \mathcal{U}, U_n \subseteq U_{n+1}, n \geq 1, \cup_n U_n = U$ and $\Pi (U_n) < \infty, n \geq 1$. Let $s \in \mathbb{R}, p \in (1, \infty)$, $\Phi \in \mathbb{D}_{r,p}$, where $\mathbb{D}_{r,p} = \mathbb{D}_{r,p} (A) = \mathbb{B}^s_{r,p} (A)$ with $r = 0, p,$
or $\mathbb{D}_{r,p} = \mathbb{H}^r_{r,p} (A)$ with $r = 0, 2, A = \mathbb{R}^d$ or $E$. For $\Phi \in \mathbb{D}_{r,p}$ we set

$$\Phi_n = \sum_{j=0}^{n} \Phi \ast \varphi_j \chi_{U_n}, \text{ if } r = 2, p, \Phi_n = \sum_{j=0}^{n} \Phi \ast \varphi_j, \text{ if } r = 0.$$ 

Then there is $C > 0$ so that

$$|\Phi_n|_{\mathbb{D}_{r,p}} \leq C |\Phi|_{\mathbb{D}_{r,p}}, \Phi \in \mathbb{D}_{r,p}, n \geq 1,$$

and $|\Phi_n - \Phi|_{\mathbb{D}_{r,p}} \to 0$ as $n \to \infty$. Moreover, for $r = 0, 2, p$, every $n$ and multiindex $\gamma \in \mathbb{N}_0^d$,

$$E \int_0^T \sup_x |D^\gamma \Phi_n|_{V_r}^p dt + |D^\gamma \Phi_n|_{L_{r,p} (E)}^p < \infty \text{ if } A = E,$$

$$E [\sup_x |D^\gamma \Phi_n|_{V_r}] + |D^\gamma \Phi_n|_{L_{r,p} (\mathbb{R}^d)}^p < \infty \text{ if } A = \mathbb{R}^d,$$

Proof. Let $\tilde{\Phi}_n = \Phi \chi_{U_n}, n \geq 1$. Since

$$\varphi_k = \sum_{l=-1}^{1} \varphi_{k+l} \ast \varphi_k, k \geq 1, \varphi_0 = (\varphi_0 + \varphi_1) \ast \varphi_0,$$

we have for $n > 1$,

$$\tilde{\Phi}_n \ast \varphi_k = 0, k < n,$$

$$\tilde{\Phi}_n \ast \varphi_k = \tilde{\Phi}_n \ast \varphi_{k-1} + \tilde{\Phi}_n \ast \varphi_k + \tilde{\Phi}_n \ast \varphi_{k+1} \ast \varphi_k, k > n + 1,$$

$$\tilde{\Phi}_n \ast \varphi_n = \tilde{\Phi}_n \ast \varphi_{n+1} \ast \varphi_n,$$

$$\tilde{\Phi}_n \ast \varphi_{n+1} = \tilde{\Phi}_n \ast \varphi_{n+1} + \tilde{\Phi}_n \ast \varphi_{n+2} \ast \varphi_{n+1}.$$

Let $V_r = L_r (U, U, \Pi), r = 2, p$ and $V_0 = \mathbb{R}$. By Corollary 2 in [15], there is a constant $C$ independent of $\Phi \in \mathbb{H}^s_{r,p} (E)$ so that

$$\left| \left( \sum_{j=0}^{\infty} w (N^{-j})^{-s} (\tilde{\Phi}_n \ast \varphi_j)_{V_r}^2 \right)^{1/2} \right|_{L_p (E)} \leq C \left| \left( \sum_{j=n}^{\infty} w (N^{-j})^{-s} \Phi \ast \varphi_j^2 \right)^{1/2} \right|_{L_p (E)} \to 0, r = 0, 2,$$
as \( n \to \infty \). Obviously

\[
\left| \Phi_n - \Phi \right|_{L_r,p(E)} \leq C \left( \sum_{j=0}^{j+n} \left| \Phi_j \right|_{L_r,p(E)} \right),
\]

and

\[
\left| \Phi_n - \Phi \right|_{L_r,p(E)} = 0, j < n, r = 0, p.
\]

Thus \( \Phi_n \to \Phi \) as \( n \to \infty \), \( r = 0, 2, p \).

Let \( r = 0, 2, p \), \( \Phi \in D_{r,p}(E) \). Obviously, for any \( k \geq 0 \),

\[
\mathbb{E} \int_E |\Phi \ast \varphi_k|^p_{V_r} \, dx dt < \infty.
\]

Since for any multiindex \( \gamma \in \mathbb{N}^d_0 \),

\[
\Phi \ast \varphi_k = \Phi \ast \varphi_k \ast \bar{\varphi}_k, D^\gamma \Phi \ast \varphi_k = \Phi \ast \varphi_k \ast D^\gamma \bar{\varphi}_k,
\]

and \( \mathbb{P} \)-a.s. for all \( s, x \), with \( \frac{1}{q} + \frac{1}{p} = 1 \),

\[
|D^\gamma \Phi \ast \varphi_k (s, x)|_{V_r} \leq \int |\Phi \ast \varphi_k (s, x - y)|_{V_r} |D^\gamma \bar{\varphi}_k (y)| \, dy,
\]

\[
\sup_x |D^\gamma \Phi \ast \varphi_k (s, x)|_{V_r} \leq \left( \int |\Phi \ast \varphi_k (s, \cdot)|_{V_r}^p \, dx \right)^{1/p} |D^\gamma \bar{\varphi}_k|_{L_q(\mathbb{R}^d)},
\]

we have for any multiindex \( \gamma \),

\[
|D^\gamma \Phi \ast \varphi_k|_{L_r,p(E)} < \infty,
\]

and

\[
\mathbb{E} \int_0^T \sup_x |D^\gamma \Phi \ast \varphi_k|^p_{V_r} \, dt < \infty, r = 0, 2, p.
\]

The proof for the case of \( A = \mathbb{R}^d \) is a repeat with obvious changes. The statement follows. \( \square \)

**Corollary 2.** The space \( C_0^\infty (\mathbb{R}^d; V_r) \) of \( V_r \)-valued infinitely differentiable functions with compact support is dense in \( D_r (\mathbb{R}^d), r = 0, 2, p \).

**Proof.** In the view of Lemma 15 it suffices to show that for any \( V = V_r \)-valued function \( f \) such that for all multiindex \( \gamma \in \mathbb{N}^d_0 \),

\[
\sup_x |D^\gamma f (x)|_{V_r} + |D^\gamma f|_{L_p(\mathbb{R}^d; V_r)} < \infty,
\]

there exists \( f_n \in C_0^\infty (\mathbb{R}^d; V_r) \) so that \( f_n \to f \) in \( D_r (\mathbb{R}^d) \). Let \( g \in C_0^\infty (\mathbb{R}^d) \) with \( 0 \leq g (x) \leq 1, x \in \mathbb{R}^d, g (x) = 1 \) for \( |x| \leq 1 \), and \( g (x) = 0 \) for \( |x| \geq 2 \).

Let

\[
f_n (x) := f (x) g (x/n), x \in \mathbb{R}^d.
\]

Obviously \( f_n \in C_0^\infty (\mathbb{R}^d, V_r) \), and for any multiindex \( \beta \),
\[ D^\beta f_n (x) \]
\[ = D^\beta f (x) g (x/n) + \sum_{\beta_1 + \beta_2 = \beta_1, \beta_2 \geq 1} n^{-|\beta_2|} D^{\beta_1} f (x) \left( D^{\beta_2} g \right) (x/n), x \in \mathbb{R}^d, \]
\[ \left| D^\beta f_n \right|_{L^p(\mathbb{R}^d; V)} \]
\[ \leq C (|\beta|) \sup_{\beta' \leq |\beta|} \left| D^{\beta'} f \right|_{L^p(\mathbb{R}^d; V)}, \]
and \( |D^\beta f_n - D^\beta f|_{L^p(\mathbb{R}^d; V)} \to 0. \) Since for any multiindex \( \beta \) we have \( \int y^\beta \varphi_j (y) \, dy = 0, \) it follows for \( m > 0, j \geq 1, \) by Taylor remainder theorem, for \( x \in \mathbb{R}^d, \)
\[ f_n \ast \varphi_j (x) \]
\[ = \int \varphi_j (y) \left\{ f_n (x - y) - \sum_{|\beta| \leq m} \frac{D^\beta f_n (x)}{\beta!} (-y)^\beta \right\} \, dy \]
\[ = \int \varphi_j (y) \sum_{|\beta| = m+1} \int_0^1 (1 - t)^{m+1} (m+1)! \left( D^\beta f_n \right) (x - ty) (-y)^\beta \, dt \, dy \]
\[ = N^{-j(m+1)} \sum_{|\beta| = m+1} \int \varphi (y) \int_0^1 (1 - t)^{m+1} (m+1)! \left( D^\beta f_n \right) (x - tN^{-j}y) \, dt \, (-y)^\beta \, dy. \]

By Lemma 11, there exists \( \sigma' > 0 \) such that \( w (N^{-j})^{-s} \leq CN^{j\sigma'} \). Let \( m > 1 \)
be such that \( t = N \sigma' s N^{-m} < 1. \) Hence there is a constant \( C = C (m, w_\nu) \)
(independent of \( n \)) so that
\[ w (N^{-j})^{-s} \left| f_n \ast \varphi_j \right|_{L^p(\mathbb{R}^d; V)} \leq C (m, w_\nu) t^j, j \geq 0. \]

Now, for \( r = 0, 2 \) and any \( k \geq 0, \)
\[
\left\| \left( \sum_{j=k}^\infty w (N^{-j})^{-s} \left| f_n \ast \varphi_j (x) \right|^2 \right)^{1/2} \right\|_{L^p(\mathbb{R}^d)}
\]
\[ \leq \sum_{j=k}^\infty w (N^{-j})^{-s} \left| f_n \ast \varphi_j (x) \right|_{V} \leq \sum_{j \geq k} \left| w (N^{-j})^{-s} f_n \ast \varphi_j (x) \right|_{L^p(\mathbb{R}^d; V)} \leq C (m, w_\nu) \sum_{j \geq k} t^j. \]
Since the same estimate holds for $f$,  
\[
\left| \sum_{j \geq k} w (N^{-j})^{-s} f * \varphi_j (x) \right|^{1/2}_{V_r} \leq C (m, w_r) \sum_{j \geq k} \lambda^j,
\]
and  
\[
\left| \sum_{j < k} w (N^{-j})^{-s} (f - f_n) * \varphi_j (x) \right|^{1/2}_{V_r} \to 0,
\]

it follows that  
\[
\left| \sum_{j} w (N^{-j})^{-s} (f - f_n) * \varphi_j (x) \right|^{1/2}_{V_r} \to 0
\]
as $n \to \infty$.

Likewise, for $r = 0, p$,  
\[
\lim_{n \to \infty} |f_n - f|_{B^s_{p,p}} = \lim_{n \to \infty} \left( \sum_{j=0}^{\infty} |w (N^{-j})^{-s} (f_n - f) * \varphi_j|^{p}_{L_p (\mathbb{R}^d ; V_r)} \right)^{1/p} = 0.
\]

An obvious consequence of Lemma 15 (the form of the approximating sequence is identical for different $V_r$) is the following

**Lemma 16.** Let $p \geq 1$ and $s, s' \in \mathbb{R}$. Then the set $\widehat{C}^\infty_{p,p} (E)$ is a dense subset in $\mathbb{B}^s_{p,p} (E)$, $\widehat{C}^\infty_{0,p} (\mathbb{R}^d)$ is a dense subset of $\mathbb{B}^{s'}_{p,p} (\mathbb{R}^d)$, and $\widehat{C}^\infty_{r,p} (E)$ is dense in $\mathbb{H}^s_{r,p} (E)$, $r = 0, 2$. Moreover, the set $\widehat{C}^\infty_{2,p} (E) \cap \widehat{C}^\infty_{p,p} (E)$ is a dense subset of $\mathbb{B}^s_{p,p} (E) \cap \mathbb{H}^s_{2,p} (E)$.

5. **Proof of the main results**

5.1. **Existence and uniqueness of solution for smooth input functions.** Let $\nu \in \mathcal{M}$, and $Z_t = Z_t^\nu, t \geq 0$, be the Levy process associated to it. Let $P_t (dy)$ be the distribution of $Z_t^\nu, t > 0$, and for a measurable $f \geq 0$,  
\[
T_t f (x) = \int f (x + y) P_t (dy), (t, x) \in E.
\]

We represent the solution to (1.1) with smooth input functions using the following operators:

\[
T^\lambda_t g (x) = e^{-\lambda t} \int g (x + y) P_t (dy), (t, x) \in E, \quad g \in \widehat{C}^\infty_{0,p} (\mathbb{R}^d), p > 1,
\]

\[
R^\lambda_t f (t, x) = \int_0^t e^{-\lambda (t-s)} \int f (s, x + y) P_{t-s} (dy) ds, (t, x) \in E, \quad f \in \widehat{C}^\infty_{0,p} (E), p > 1,
\]
and
\[
\tilde{R}_\lambda \Phi (t, x) = \int_0^t e^{-\lambda(t-s)} \int U \Phi (s, x + y, z) P_{t-s} (dy, dz), (t, x) \in E,
\]
\[
\Phi \in \tilde{C}^\infty_{2,p} (E) \cap \tilde{C}^\infty_{p,p} (E) \text{ if } p \geq 2, \Phi \in \tilde{C}^\infty_{p,p} (E) \text{ if } p \in (1, 2).
\]

We remind readers that here \(q (ds, dz)\) is the martingale measure as given in (1.1).

**Lemma 17.** Let \(f \in \tilde{C}^\infty_{p,p} (E), g \in \tilde{C}^\infty_{0,p} (R^d), \Phi \in \tilde{C}^\infty_{2,p} (E) \cap \tilde{C}^\infty_{p,p} (E)\) for \(p \in [2, \infty)\) and \(\Phi \in \tilde{C}^\infty_{p,p} (E)\) for \(p \in (1, 2)\), then the following estimates hold for any multiindex \(\gamma \in N^d_0\):

(i) \(P\text{-}a.s.
\[
|D^\gamma T^\lambda g|_{L^p(E)} \leq \rho_p^\frac{1}{2} |D^\gamma g|_{L^p_p(R^d)} , \quad g \in \tilde{C}^\infty_{0,p} (R^d), p \geq 1,
\]
\[
|D^\gamma R^\lambda \Phi|_{L^p(E)} \leq \rho_\lambda |D^\gamma \Phi|_{L^p_p(E)} , \quad f \in \tilde{C}^\infty_{p,p} (E), p \geq 1,
\]

and
\[
|D^\gamma R^\lambda \Phi (t, \cdot)|_{L^p_p(R^d)} \leq \int_0^t |D^\gamma \Phi (s, \cdot)|_{L^p_p(R^d)} ds, t \geq 0,
\]
\[
|T^\lambda g|_{L^p_p(R^d)} \leq e^{-\lambda t} |g|_{L^p_p(R^d)}, t \geq 0, p \geq 1;
\]

(ii) For each \(p \geq 2\),
\[
|D^\gamma \tilde{R}_\lambda \Phi|_{L^p_p(E)}^p \leq C \left[ \rho_\lambda \mathbb{E} \int_0^T |D^\gamma \Phi (s, \cdot)|_{L^p_p(R^d)}^p ds + \rho_\lambda |D^\gamma \Phi|_{L^p_p(E)}^p \right],
\]
\[
\Phi \in \tilde{C}^\infty_{2,p} (E) \cap \tilde{C}^\infty_{p,p} (E),
\]

and for each \(p \in (1, 2)\),
\[
|D^\gamma \tilde{R}_\lambda \Phi|_{L^p_p(E)}^p \leq C \rho_\lambda |D^\gamma \Phi|_{L^p_p(E)}^p, \Phi \in \tilde{C}^\infty_{p,p} (E),
\]

where \(\rho_\lambda = T \wedge \frac{1}{\lambda}\). Moreover,
\[
|D^\gamma \tilde{R}_\lambda \Phi (t, \cdot)|_{L^p_p(R^d)}^p \leq C \left\{ \mathbb{E} \left[ \left( \int_0^t |D^\gamma \Phi (s, \cdot)|_{L^p_p(R^d)}^2 ds \right)^{p/2} \right] + \mathbb{E} \int_0^t |D^\gamma \Phi (s, \cdot)|_{L^p_p(R^d)}^p ds \right\},
\]
if \(p \geq 2\), and
\[
|D^\gamma \tilde{R}_\lambda \Phi (t, \cdot)|_{L^p_p(R^d)}^p \leq C \mathbb{E} \int_0^t |D^\gamma \Phi (s, \cdot)|_{L^p_p(R^d)}^p ds, t \geq 0,
\]
if \(p \in (1, 2)\).
Proof. The estimates (i) follow from Lemma 15 in [15] and Lemma 8 in [14]. Due to similarity, we only prove (ii) for the case \( p \geq 2 \). Let \( \Phi \in C_{2,p}(E) \cap \tilde{C}_{p,p}(E) \), recall that \( \Phi = \Phi \mid_{U_n} \) for some \( U_n \in \mathcal{U} \) with \( \Pi(U_n) < \infty \). Obviously, for any multiindex \( \gamma \), \((t, x) \in E\),

\[
D^{\gamma} \tilde{R}_\lambda \Phi (t, x) = \int_0^t e^{-\lambda(t-s)} \int_U D^{\gamma} \Phi (s, x + y, z) P_{t-s} (dy) q (ds, dz)
\]

\[
= \int_0^t e^{-\lambda(t-s)} \int_U D^{\gamma} \Phi (s, x + y, z) P_{t-s} (dy) p (ds, dz)
\]

\[
- \int_0^t e^{-\lambda(t-s)} \int_U D^{\gamma} \Phi (s, x + y, z) P_{t-s} (dy) \Pi (dz) ds.
\]

By Kunita’s inequality (see Theorem 2.11 of [19]), for \( t > 0 \),

\[
E \int \left| D^{\gamma} \tilde{R}_\lambda \Phi (t, x) \right|^p dx
\]

\[
\leq C E \left( \int_0^t e^{-2\lambda(t-s)} \left( \int_U |D^{\gamma} \Phi (s, x + y, z)|^2 \Pi (dz) \right) P_{t-s} (dy) ds \right)^{p/2} dx
\]

\[
+ C E \left( \int_0^t e^{-\lambda(t-s)} |T_{t-s} D^{\gamma} \Phi (s, x, z)|^p \Pi (dz) ds dx ds \right.
\]

\[
= B (t) + D (t).
\]

By Fubini theorem and Minkowski inequality,

\[
D (t) \leq C E \int_0^t e^{-\lambda(t-s)} |D^{\gamma} \Phi (s, \cdot)|^{p}_{L_{p,p}(\mathbb{R}^d)} ds, t > 0,
\]

and

\[
B (t) \leq C E \left[ \left( \int_0^t e^{-2\lambda(t-s)} |D^{\gamma} \Phi (s, \cdot)|^{2}_{L_{2,p}(\mathbb{R}^d)} ds \right)^{p/2} \right]
\]

\[
\leq C \left( \frac{1}{\lambda} \right)^{p/2} E \left[ \int_0^t 2\lambda e^{-2\lambda(t-s)} |D^{\gamma} \Phi (s, \cdot)|^{p}_{L_{2,p}(\mathbb{R}^d)} ds \right].
\]

Now,

\[
\int_0^T D (t) dt \leq C \rho \lambda E \int_0^T \left| D^{\gamma} \Phi (s, \cdot) \right|^{p}_{L_{p,p}(\mathbb{R}^d)} ds
\]

and

\[
\int_0^T B (t) dt \leq C \rho \lambda E \int_0^T \left| D^{\gamma} \Phi (s, \cdot) \right|^{p}_{L_{2,p}(\mathbb{R}^d)} ds.
\]

Lemma 18. For \( \nu \in \mathfrak{A}^\nu \), let \( f \in \tilde{C}_{0,p}^\infty (E), g \in \tilde{C}_{0,p}^\infty (\mathbb{R}^d), \Phi \in \tilde{C}_{2,p}^\infty (E) \cap \tilde{C}_{p,p}^\infty (E) \), \( p \in [2, \infty) \) and \( \Phi \in \tilde{C}_{p,p}^\infty (E) \) for \( p \in (1, 2) \), then there is unique \( u \in \tilde{C}_{0,p}^\infty (E) \) solving \( [L, \Phi] \). Moreover,

\[
u (x, t) = T_t^\lambda g (x) + R_\lambda f (t, x) + \tilde{R}_t \Phi (t, x), (t, x) \in E,
\]

\[
\int_0^1 d\nu (x, t) = f (t, x) + \int_0^1 \left( \int_0^t \int |D^{\gamma} \Phi (s, \cdot)|^{p}_{L_{p,p}(\mathbb{R}^d)} ds \right) dt.
\]
and \( u_1(t, x) = T^\lambda_t g(x), (t, x) \in E, \) solves (1.1) with \( f = 0, \Phi = 0, \) \( u_2 = R^\lambda f \) solves (1.1) with \( g = 0, \Phi = 0, \) and \( u_3 = \tilde{R}^\lambda \Phi \) solves (1.1) with \( g = 0, f = 0. \)

**Proof.** Uniqueness is a simple repeat of the proof of Lemma 8 in [14]. We prove that \( u_1, u_2 \) solve the corresponding equations by repeating the proofs of Lemma 8 in [14] and Lemma 15 in [15]. Let \( \Phi \in \tilde{C}_{2,p}^\infty (E) \cap \tilde{C}_{p,p}^\infty (E) \) if \( p \in [2, \infty) \) or \( \Phi \in \tilde{C}_{p,p}^\infty (E) \) if \( p \in (1, 2]. \) Recall that \( \Phi = \Phi \chi_{U_n} \) for some \( U_n \in \mathcal{U} \) with \( \Pi(U_n) < \infty. \) A simple application of Itô formula and Fubini theorem show that \( \mathbb{P} \)-a.s.

\[
\begin{align*}
&u_3(t, x) \\
&= \int_0^t e^{-\lambda(t-s)} \int_U \Phi(s, x+y, z) P_{t-s}(dy) q(ds, dz) \\
&= \int_0^t \int_U \Phi(s, x, z) q(ds, dz) + \int_0^t \int_0^t e^{-\lambda(r-s)} \times \\
&\quad \int_U \left[ L^r \Phi(s, x+y, z) - \lambda \Phi(s, x+y, z) \right] P_{r-s}(dy) drq(ds, dz) \\
&= \int_0^t \int_U \Phi(s, x, z) q(ds, dz) + \int_0^t \left[ L^r u_3(s, x) - \lambda u_3(s, x) \right] ds, (t, x) \in E.
\end{align*}
\]

\[\square\]

5.2. **Estimate of** \( T^\lambda g. \) The solution associated to the initial value function is given explicitly by

\[ T^\lambda g = G^\lambda_t * g, \quad g \in \tilde{C}_{0,p}^\infty \left( \mathbb{R}^d \right), \]

where \( G^\lambda_t(x) := \exp \left( -\lambda t \right) p^\nu(t, x), \nu^\nu(dy) = \nu(-dy). \)

We prove that there is \( C = C(\nu, d, p) \) so that a.s.

\[ |L^r T^\lambda g|_{H^{\nu,s}_{p,q}(E)} \leq C |g|_{B^{\nu,s+1-1/p}_{pp}(\mathbb{R}^d)}, \quad \text{(5.1)} \]

Since by Proposition [1, 2] \( J^s_t : H^{\nu,s}_{p,q}(\mathbb{R}^d) \to H^{\nu,s-t}_{p,q}(\mathbb{R}^d) \) and \( J^t_s : B^{\nu,s}_{pp}(\mathbb{R}^d) \to B^{\nu,s-t}_{pp}(\mathbb{R}^d) \) are isomorphisms for any \( s, t \in \mathbb{R}, \) it is enough to derive the estimate for \( s = 0. \)

**Lemma 19.** Let \( \nu \in \mathfrak{A}^\nu, w = w^\nu \) is a continuous \( O-RV \) function and \( A, B \) hold. Then there is \( C = C(\nu, d, p) \) so that

\[ |L^r T^\lambda g|_{L^p(E)} \leq C |g|_{B^{\nu,1-1/p}_{pp}(\mathbb{R}^d)}, \quad g \in \tilde{C}_{0,p}^\infty \left( \mathbb{R}^d \right), \quad \text{(5.2)} \]

**Proof.** We will use an equivalent norm (see Proposition [1]) Let \( N > 1 \) be an integer. There exists a function \( \phi \in C^\infty(\mathbb{R}^d) \) such that \( \text{supp} \phi = \{ \xi : \frac{1}{N} \leq |\xi| \leq N \}, \phi(\xi) > 0 \) if \( N^{-1} < |\xi| < N \) and

\[
\sum_{j=-\infty}^{\infty} \phi(N^{-j}\xi) = 1 \quad \text{if} \quad \xi \neq 0.
\]
Let
\[ \tilde{\phi} (\xi) = \phi (N \xi) + \phi (\xi) + \phi (N^{-1} \xi), \xi \in \mathbb{R}^d. \]
Note that \( \text{supp} \tilde{\phi} \subseteq \{ N^{-2} \leq |\xi| \leq N^2 \} \) and \( \tilde{\phi} \phi = \phi \). Let \( \varphi_k = \mathcal{F}^{-1} \phi (N^{-k} \cdot), k \geq 1 \), and \( \varphi_0 \in \mathcal{S} (\mathbb{R}^d) \) is defined as
\[ \varphi_0 = \mathcal{F}^{-1} \left[ 1 - \sum_{k=1}^{\infty} \phi (N^{-k} \cdot) \right]. \]
Let \( \phi_0 (\xi) = \mathcal{F} \varphi_0 (\xi), \tilde{\phi}_0 (\xi) = \mathcal{F} \varphi_0 (\xi) + \mathcal{F} \varphi_1 (\xi), \xi \in \mathbb{R}^d, \tilde{\varphi} = \mathcal{F}^{-1} \tilde{\phi}, \varphi = \mathcal{F}^{-1} \phi \). Let
\[ \tilde{\varphi}_k = \sum_{l=-1}^{1} \varphi_{k+l}, k \geq 1, \tilde{\varphi}_0 = \varphi_0 + \varphi_1. \]
Note that \( \varphi_k = \tilde{\varphi}_k * \varphi_k, k \geq 0 \). For \( j \geq 1 \),
\[ \mathcal{F} \left[ L^\nu T^\lambda g (t, \cdot) * \varphi_j \right] \]
\[ = w (N^{-j})^{-1} \psi_{N^{-j}} (N^{-j} \xi) \exp \left\{ w (N^{-j})^{-1} \psi_{N^{-j}} (N^{-j} \xi) t - \lambda t \right\} \]
\[ \times \tilde{\phi} (N^{-j} \xi) \tilde{g}_j (\xi), \]
and
\[ \mathcal{F} \left[ L^\nu T^\lambda g (t, \cdot) * \varphi_0 \right] = \psi' (\xi) \exp \left\{ \psi' (\xi) t - \lambda t \right\} \tilde{\phi}_0 (\xi) \tilde{g}_0 (\xi), \]
where \( g_j = g * \varphi_j, j \geq 0 \).
Let \( Z^j = Z_{N^{-j}}, j \geq 1 \). Let \( \tilde{\phi} \in C_0^\infty (\mathbb{R}^d), 0 \notin \text{supp}(\tilde{\phi}) \) and \( \tilde{\phi} \tilde{\phi} = \tilde{\phi}, \tilde{\eta} = \mathcal{F}^{-1} \tilde{\phi}_0 \). Denoting \( \eta = \mathcal{F}^{-1} \tilde{\phi}_0 \), we have
\[ L^\nu T^\lambda g (t, \cdot) * \varphi_j = w (N^{-j})^{-1} \tilde{H}_t^\lambda j * g_j, j \geq 1, \]
\[ L^\nu T^\lambda g (t, \cdot) * \varphi_0 = \tilde{H}_t^\lambda 0 * g_0, t > 0, \]
where for \( j \geq 1 \),
\[ \tilde{H}_t^\lambda j (x) = N^d H^\lambda j \frac{w(N^{-j})}{w(N^{-j})^{-1}} (N^j x), (t, x) \in E, \]
\[ H^\lambda j = e^{-\lambda w(N^{-j}) t} (L^\nu N^{-j} \tilde{\eta}) * E \tilde{\varphi} (\cdot + Z^j_t), t > 0, \]
and
\[ \tilde{H}_t^\lambda 0 (x) = e^{-\lambda t} L^\nu E \tilde{\eta} (\cdot + Z^\nu_t), (t, x) \in E. \]
By Lemma 5 in [13],
\[ \sup_j \int |L^\nu N^{-j} \tilde{\eta}| \, dx < \infty. \]
Hence by Lemma [13],
\[ \int |H^\lambda j | \, dx \leq \int |L^\nu N^{-j} \tilde{\eta}| \, dx \int \left| E \tilde{\varphi} (\cdot + Z^\nu_t) \right| \, dx \leq C e^{-ct}, t > 0, j \geq 1, \]
and hence,
\[
(5.4) \quad \int |\tilde{H}_t^{\lambda_j}| \; dx \leq C \exp \left\{ -cw (N^{-j})^{-1} t \right\}, \; t > 0, j \geq 1.
\]
and by Lemma 9,
\[
(5.5) \quad \int |\tilde{H}_t^{\lambda_0}| \; dx \leq C \left( \frac{1}{t \wedge 1} \right), \; t > 0.
\]

It follows by Proposition 1 and (5.3) that
\[
|L'^{\alpha} \lambda_0 (t) |_{L_p(\mathbb{R}^d)}^p \leq C \left( \sum_{j=1}^{\infty} \left| w \left( N^{-j} \right)^{-1} \tilde{H}_t^{\lambda_j} * g_j \right|^p \right)^{1/2} \left| \tilde{H}_t^{\lambda_0} \right|^p_{L_p(\mathbb{R}^d)} + C \int \left| \tilde{H}_t^{\lambda_0} * g_0 \right|^p \; dx.
\]

Hence
\[
|L'^{\alpha} \lambda_0 (t) |_{L_p(\mathbb{R}^d)}^p \leq C \sum_{j=0}^{\infty} \left| w \left( N^{-j} \right)^{-1} \tilde{H}_t^{\lambda_j} * g_j \right|^p_{L_p(\mathbb{R}^d)} \quad \text{if } p \in (1, 2],
\]
and, by Minkowski inequality,
\[
(5.6) \quad \int \left| w \left( N^{-j} \right)^{-1} \tilde{H}_t^{\lambda_j} * g_j \right|^p \; dx
\]
\[
\leq \left( \int \left| \tilde{H}_t^{\lambda_j} \right|^p \; dx \right)^{1/2} \int \left| \tilde{H}_t^{\lambda_j} \right|^p \; dx \int \left| w \left( N^{-j} \right)^{-1} g_j \right|^p \; dx
\]
\[
\leq C \left( \sum_{j=1}^{\infty} \left( \int \left| w \left( N^{-j} \right)^{-1} \tilde{H}_t^{\lambda_j} * g_j \right|^p \; dx \right)^{2/p} \right)^{p/2}
\]
\[
+ C \int \left| \tilde{H}_t^{\lambda_0} * g_0 \right|^p \; dx
\]
if \( p > 2 \). Now, by (5.4),
\[
(5.7) \quad \int \left| \tilde{H}_t^{\lambda_0} * g_0 \right|^p \; dx \leq C \left( \frac{1}{t \wedge 1} \right)^p \int |g_0|^p \; dx.
\]

Therefore for \( p \in (1, 2] \),
\[
\int_0^\infty |L'^{\alpha} \lambda_0 (t) |_{L_p(\mathbb{R}^d)}^p \; dt \leq C \sum_{j=0}^{\infty} \left| w \left( N^{-j} \right)^{-1-1/p} \right| g_j |_{L_p(\mathbb{R}^d)}^p,
\]
and (5.2) follows by Proposition 1.
Let $p > 2$. In this case,
\[
\int_0^\infty |L^\nu T_\lambda g(t)|_p^p \, dt \leq C[G + |g_0|_p^p],
\]
where
\[
G = \int_0^\infty \left( \sum_{j=1}^\infty \exp \left\{ -cw \left( \frac{N-j}{2} \right)^{-1} t \right\} k_j^2 \right)^{p/2} \, dt
\]
with $c > 0$ and
\[
k_j = w(N-j)^{-1} |g_j|_{L_p} \quad j \geq 1.
\]
Now, let $B = \{ j : a(t) \leq N-j \}$ where $a(t) = \inf \{ r : w(r) \geq t \} \, , \, t > 0$. Then
\[
\sum_{j=1}^\infty e^{-cw(N-j)^{-1}t} k_j^2 = \sum_{j \in B} \sum_{j \not\in B} = D(t) + E(t) , t > 0.
\]
Let $0 < \frac{\beta p}{2} < p_1 \wedge p_2$, by Hölder inequality,
\[
D(t) \leq C \sum_{j=1}^\infty \chi_{\{ j : a(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right) \left( \frac{a(t)}{N-j} \right)^{-\beta} k_j^2 \leq C \left( \sum_{j=1}^\infty \chi_{\{ j : a(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right)^{-\frac{\beta p}{p-2}} \right)^{1-\frac{p}{p}} \left( \sum_{j=1}^\infty \chi_{\{ j : a(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right)^{-\beta \frac{p}{2}} k_j^p \right)^{\frac{p}{p}} = C D_1^{\frac{p}{2}} D_2^p.
\]
Denoting $\beta' = \beta p / (p-2)$, we have for $t > 0$,
\[
D_1(t) = \sum_{j=1}^\infty \chi_{\{ j : a(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right)^{\beta'} \leq C \int_0^\infty \chi_{\{ s(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right)^{\beta'} \, dx \leq C \int_0^1 \frac{y^{\beta'} \, dx}{y} < \infty.
\]
Applying Corollary with $1 > \beta \cdot \frac{p}{2} \cdot \left( \frac{1}{p_1} \vee \frac{1}{p_2} \right)$, and arbitrary $\rho > 1$,
\[
\int_0^\infty D_2^{p/2} \, dt \leq C \sum_{j=1}^\infty \int_0^\infty \chi_{\{ a(t) \leq N-j \}} \left( \frac{a(t)}{N-j} \right)^{-\beta \frac{p}{2}} k_j^p \, dt \leq C \sum_{j=1}^\infty w(N-j)^{\rho} \left( \frac{a(t)}{N-j} \right)^{-\beta \frac{p}{2}} dt k_j^p \leq C \sum_{j=1}^\infty w(N-j)^{\rho} \left( \frac{a(w(N-j)^{\rho})}{N-j} \right)^{-\beta \frac{p}{2}} k_j^p.
\]
Hence
\[ \int_0^\infty D_2^{p/2} dt \leq C \sum_{j=1}^\infty w(N^{-j}) k_j^p. \]

Now, we estimate the second term \( E(t), t > 0 \). By Hölder inequality, for \( t > 0 \),
\[ E(t) = \sum_{a(t) > N^{-j}} e^{-cw(N^{-j})^{-1} t} w(N^{-j})^{-2} |g_j|^2_{L^p} \]
\[ \leq \left( \sum_{a(t) > N^{-j}} e^{-cw(N^{-j})^{-1} t} \right)^{p-2 \over p} \left( \sum_{a(t) > N^{-j}} e^{-cw(N^{-j})^{-1} t} k_j^p \right)^{2 \over p}. \]

Changing the variable of integration (\( y = \frac{1}{a(t)N_x} \)), we have, by Lemma \ref{lemma:1}, for some \( l > 0 \),
\[ \sum_{a(t) \geq N^{-j}} e^{-cw(N^{-j})^{-1} t} \leq \sum_{a(t) \geq N^{-j}} \exp \left\{ -c \frac{w(a(t))}{a(t)N^{-j}} \right\} \]
\[ \leq \sum_{a(t) \geq N^{-j}} \exp \left\{ -c \left( \frac{a(t)}{N^{-j}} \right)^l \right\} = \sum_{a(t) \geq N^{-j}} \exp \left\{ -c \left( N^j a(t) \right)^l \right\} \]
\[ \leq C \int_{N^j a(t) \geq 1} \exp \left\{ -c \left( N^j a(t) \right)^l \right\} dx = C \int_1^\infty \exp \left\{ -cy^l \right\} \frac{dy}{y} \]
\[ \leq C \sum_{j} w(N^{-j}) k_j^p. \]

The estimate \( (5.2) \) is proved. \( \square \)

5.3. **Estimates of** \( R_\lambda f, \tilde{R}_\lambda \Phi \), **verification of Hörmander conditions.**
First we show that for each \( p > 1 \) there is \( C > 0 \) so that
\[ (5.8) \quad |L^p R_\lambda f|_{\tilde{H}^{\alpha p}_p(E)} \leq C |f|_{\tilde{H}^{\alpha p}_p(E)}; \quad f \in \tilde{C}^{\infty}_{0,p}(E). \]

According to Lemma \ref{lemma:1},
\[ \frac{w(\epsilon r)}{w(r)} \leq C (\epsilon^{\alpha_2} \vee \epsilon^{\alpha_1}), r, \epsilon > 0. \]

Thus \( w \) is a scaling function with scaling factor \( \epsilon^{\alpha_2} \vee \epsilon^{\alpha_1} \) as defined in \cite{14} and \cite{15}. Therefore, we may apply Calderon-Zygmund theorem (see Theorem 5 in \cite{14}) to derive \( (5.8) \). For \( p = 2 \), the estimate \( (5.8) \) follows by Plancherel identity (see \cite{15}). We remind some simple facts that for a non-decreasing continuous function \( w : (0, \infty) \to (0, \infty) \) such that \( \lim_{t \to 0^+} w(\epsilon) = 0 \) and
0, we have\\
\text{Lemma 20.} \ Let \ w = w_\nu be a continuous \ O-RV \ function \ and \ A, \ B \ hold. \ Let \ \alpha_1 > q_1 \lor q_2, \ 0 < \alpha_2 < p_1 \land p_2, \ and\\
\begin{align*}
\alpha_2 &> 1 \text{ if } \sigma \in (1, 2), \\
\alpha_1 &\leq 1 \text{ if } \sigma \in (0, 1), \alpha_1 \leq 2 \text{ if } \sigma \in [1, 2). \\
\end{align*}
Let \ \pi \in \mathcal{A}_\sigma^{\text{sign}}, \ and \ assume \ that\\
\begin{align*}
\int_{|y| \leq 1} |y|^{\alpha_1} d|\pi|_R + \int_{|y| > 1} |y|^{\alpha_2} d|\pi|_R \leq M, \ R > 0.
\end{align*}
Let \ \epsilon > 0 \ and\\
\begin{align*}
K^\epsilon_\lambda (t, x) = e^{-\lambda t} L^{\pi} p^{\nu^*} (t, x) \chi_{[\epsilon, \infty]} (t), \ t > 0, x \in \mathbb{R}^d,
\end{align*}
where \ \nu^* (dy) = \nu (-dy). \ There \ exist \ C_0 > 1 \ and \ C \ so \ that\\
\begin{align*}
(5.9) \quad \mathcal{I} = \int \chi_{Q_{C_0 \eta}} (t, x) |K^\epsilon_\lambda (t - s, x - y) - K^\epsilon_\lambda (t, x)| \ dx \ dt \leq CM \\
\end{align*}
for all \ \{|s| \leq w(\eta), |y| \leq \eta, \eta > 0, \ where \ Q_{C_0 \eta} (0) = (-w(C_0 \eta), w(C_0 \eta)) \times \\
\{x : |x| \leq C_0 \eta\}.
\textbf{Proof.} \ Fix \ \rho > 1 \ throughout \ the \ proof. \ By \ Lemma 1, \ we \ choose \ C_0 > 3 \ such \ that \ w(C_0 \eta) > 3w(\eta), \eta > 0. \ We \ split\\
\begin{align*}
\mathcal{I} = \int_{-\infty}^{2|s|} \int_{\cdots} + \int_{2|s|}^{\infty} \int_{\cdots} = \mathcal{I}_1 + \mathcal{I}_2
\end{align*}
Since \ w(C_0 \eta) > 3w(\eta), \eta > 0, \ it \ follows \ by \ Lemma 9, \ Corollary 1 \ and \ Lemma 1 for \ \rho, \ denoting \ k_0 = C_0 - 1,\\
\begin{align*}
\mathcal{I}_1 &\leq C \int_0^{3|s|} \int_{|x| > k_0 a(|s|)} \left| L^\pi p^{\nu^*} (t, x) \right| \ dx \ dt \\
&\leq CM \frac{1}{a^2 (|s|)} \int_0^{3|s|} t^{-\alpha_1} \left( a (t) \right)^{\alpha_2} dt \leq CM \frac{a^2 (|s|)}{a^2 (|s|)} \\
&= CM.
\end{align*}
Now,
\[ I_2 \leq \int_{|s|}^{\infty} \int \chi_{Q_{C_{0}\eta}(0)} \left| L^p p^\nu (t - s, x - y) - L^p p^\nu (t - s, x) \right| dx dt + \int_{|s|}^{\infty} \int \chi_{Q_{C_{0}\eta}(0)} \chi_{[\epsilon, \infty)} (t - s) L^p p^\nu (t - s, x) - \chi_{[\epsilon, \infty)} (t) L^p p^\nu (t, x) dx dt = I_{2,1} + I_{2,2}. \]

We split the estimate of \( I_{2,1} \) into two cases.

**Case 1.** Assume \(|y| \leq a (2 |s|^+), \) i.e. \( \eta \geq |y| > a (2 |s|^+) \) and \( a^{-1} (\eta) \geq a^{-1} (|y|) \geq 2 |s|. \) We split

\[ I_{2,1} = \int_{2|s|}^{\infty} \ldots \int_{2|s|+a^{-1}(|y|)}^{\infty} \int_{2|s|+a^{-1}(|y|)}^{\infty} \ldots = I_{2,1,1} + I_{2,1,2}. \]

If \( 2 |s| \leq t \leq 2 |s| + a^{-1} (|y|), \) then \( 0 \leq t \leq 3a^{-1} (\eta) \leq 3w (\eta) \leq w (C_0 \eta). \) Hence \( |x| > C_0 \eta \geq a (2 |s|) + |y| \) and

\[ |x - y| \geq (C_0 - 1) \eta = k_0 \eta \geq \frac{k_0}{2} (a (2 |s|) + |y|) \geq a (2 |s|) + |y| \text{ if } (t, x) \notin Q_{C_0 \eta}(0). \]

Also,

\[ 2 \geq \frac{2 |s| + a^{-1}(|y|)}{2 |s| + a^{-1}(|y|) - s} \geq \frac{2}{3}, \]

and, by Lemma [2]

\[ 2^{-1} \leq \frac{a (2 |s| + |y|)}{a (2 |s| + |y|)} \leq \frac{a (\frac{2}{3}a^{-1}(|y|))}{a (\frac{2}{3}a^{-1}(|y|))} \leq C. \]
By Lemma 9 Corollary 1 and (5.11),
\[ \mathcal{I}_{2,1,1} \leq C \int_{2|s| + a^{-1}(|y|)}^{2|s| + a^{-1}(|y|)} \int_{|x| > a(2|s| + |y|)} \left| L^\pi p^\nu (t - s, x) \right| dx \] 
\[ \leq \frac{CM}{a(2|s| + |y|)^{\alpha_2}} \int_0^{2|s| + a^{-1}(|y|)} (t - s)^{-1} a(|t - s|)^{\alpha_2} dt \] 
\[ \leq CM \frac{a(3|s| + a^{-1}(|y|))^{\alpha_2}}{a(2|s| + |y|)^{\alpha_2}} \leq CM \]

Then, by Lemma 9 Corollary 1 and (5.10)
\[ \mathcal{I}_{2,1,2} \leq CM |y| \int_{2|s| + a^{-1}(|y|)} \int_0^{2|s| + a^{-1}(|y|)} \left| L^\pi p^\nu (t - s, x - y) - L^\pi p^\nu (t - s, x) \right| dx \] 
\[ = CM |y| \int_0^{2|s| + a^{-1}(|y|)} (t - s)^{-1} a(|t - s|)^{-1} dr \] 
\[ \leq CM |y| a(2|s| + a^{-1}(|y|) - s)^{-1} \leq CM |y| a^{-1}(|y|) + |s|^{-1} \] 
\[ \leq CM |y| |y|^{-1} \leq CM \]

Hence, \( \mathcal{I}_{2,1} \leq C \).

Finally, by Lemma 9
\[ \mathcal{I}_{2,2} \leq \int_{2|s|}^{\infty} \int_{2|s| + a^{-1}(|y|)} \left| L^\pi p^\nu (t - s, x) - L^\pi p^\nu (t, x) \right| dx \] 
\[ + \int_{2|s| + a^{-1}(|y|)}^{2|s| + a^{-1}(|y|)} \left| L^\pi p^\nu (t, x) \right| dx \] 
\[ \leq CM. \]

The proof is complete. \( \square \)

**Remark 5.** Although we write Lemma 27 with general \( \pi \), in this paper we only need the result for \( \pi = \nu \).

Now we will show that for \( p \in [2, \infty) \), there is \( C \) so that for all \( \Phi \in \tilde{C}_{2,p}^\infty (E) \cap \tilde{C}_{p,p}^\infty (E) \),
\begin{equation}
(5.12) \quad \left| L^\nu \hat{R}^\lambda \Phi \right|_{H^\nu s(E)} \leq C \left[ \left| \Phi \right|_{H^{\nu, p+1-1/p}(E)} + \left| \Phi \right|_{H^{\nu+1/2}(E)} \right],
\end{equation}
and for \( p \in (1, 2) \), there is \( C \) so that for all \( \Phi \in \tilde{C}_{p,p}^\infty (E) \),
\begin{equation}
(5.13) \quad \left| L^\nu \hat{R}^\lambda \Phi \right|_{H^\nu s(E)} \leq C \left| \Phi \right|_{H^{\nu, p+1-1/p}(E)},
\end{equation}

Due to Proposition 1 it is enough to consider the case \( s = 0 \). Let \( \varepsilon > 0 \),
\[ G_{s,t}^\lambda (x) = \exp \left( -\lambda (t - s) \right) p^\nu (t - s, x) \chi_{[\varepsilon, \infty]} (t - s), 0 < s < t, x \in \mathbb{R}^d, \]
where \( \nu^* (dy) = \nu (-dy) \). Denote

\[
Q (t, x) = \int_0^t \int_U \tilde{\Phi}_\varepsilon (s, x, z) q (ds, dz), (t, x) \in E,
\]

\[
\tilde{\Phi}_\varepsilon (s, x, z) = \int \left( L^\nu G^\lambda_{s,t} \right) (x - y) \Phi (s, y, z) \, dy, (s, x) \in E.
\]

Obviously, with \( K^\varepsilon (t, x) = e^{-\lambda t} L^{\nu/2} \nu^* (t, x) \chi_{|\varepsilon|,\infty} (t), t > 0, x \in \mathbb{R}^d \), we have

\[
\begin{align*}
\mathbb{E} & \left[ \int_0^t \int_U \left( L^\nu G^\lambda_{s,t} \right) (x - y) \Phi (s, y, z) \, dyq (ds, dz) \right]_L^p (E) \\
& = \mathbb{E} \left[ \int_0^t \int_U L^{\nu_1/2} G^\lambda_{s,t} (x - y) L^{\nu_1/2} \Phi (s, y, z) \, dyq (ds, dz) \right]_L^p (E) \\
& = \mathbb{E} \int_0^t \int_U \int_0^T K^\varepsilon (t - s, x - y) L^{\nu_1/2} \Phi (s, y, z) \, dyq (ds, dz) \right]_L^p (E).
\end{align*}
\]

If \( 2 \leq p < \infty \), then

\[
\mathbb{E} \int_0^T |Q(t, \cdot)|^p_{L_p (\mathbb{R}^d)} dt \leq C \mathbb{E} \left\{ \int_0^T \left[ \int_0^t \int_U \tilde{\Phi}_\varepsilon (s, \cdot, z) \right]^{1/2} \Pi (dz) ds \right\}^{1/2}_{L_p (\mathbb{R}^d)} dt \}
\]

\[
+ \mathbb{E} \left\{ \int_0^T \int_U \left| \tilde{\Phi}_\varepsilon (s, \cdot, z) \right|^{p}_{L_p (\mathbb{R}^d)} \Pi (dz) dsdt \right\} = C \left( \mathbb{E} I_1 + \mathbb{E} I_2 \right).
\]

If \( 1 < p < 2 \), then

\[
\mathbb{E} \int_0^T |Q(t, \cdot)|^p_{L_p (\mathbb{R}^d)} dt \leq C \mathbb{E} I_2.
\]

**Estimate of \( \mathbb{E} I_2 \).** Let \( B^\lambda_t g(x) = e^{-\lambda t} \mathbb{E} g (x + Z^\nu_t), (t, x) \in E, g \in \tilde{C}_{0,p}^\infty (\mathbb{R}^d) \). Then

\[
I_2 = \int_0^T \int_U \int_0^t \left| \tilde{\Phi}_\varepsilon (s, \cdot, z) \right|^{p}_{L_p (\mathbb{R}^d)} \Pi (dz) dsdt
\]

\[
= \int_0^T \int_U \int_0^t \left| \left( L^\nu G^\lambda_{s,t} \right) * \Phi (s, \cdot, z) \right|^{p}_{L_p (\mathbb{R}^d)} \Pi (dz) dsdt
\]

\[
\leq \int_0^T \int_U \int_0^t \left| L^\nu B^\lambda_{t-s} \Phi (s, \cdot, z) \right|^{p}_{L_p (\mathbb{R}^d)} \Pi (dz) dsdt
\]

\[
= \int_U \int_0^T \int_0^t \left| L^\nu B^\lambda_{t-s} \Phi (s, \cdot, z) \right|^{p}_{L_p (\mathbb{R}^d)} dt ds \Pi (dz).
\]
It follows from Proposition 1 and Lemma 19 that for \( p > 1 \),

\[
\mathbb{E} I_2 \leq \mathbb{E} \int_U \int_0^T \int_s^T \left| L^\nu B_{t-s}^\lambda \Phi (s, \cdot, z) \right|_L^p dtds \Pi (dz) \\
\leq C \mathbb{E} \int_U \int_0^T \sum_{j=0}^\infty w (N^{-j})^{-(1/p)} \left| \Phi (s, \cdot, z) * \varphi_j \right|_L^p dtds \Pi (dz) \\
= C |\Phi|_{L^2_p(E)}^{p-1/p} \chi_{E}.
\]

Hence (5.13) holds for \( p \in (1, 2) \). We prove that for \( p \geq 2 \),

\[
(5.15) \quad \mathbb{E} I_1 \leq C |\Phi|_{L^2_p(E)} \in \mathbb{C}_{2,p} (E),
\]

by verifying Hörmander condition (5.16) in Lemma 21 below.

In the following statement we show that a version of a stochastic Hörmander condition holds which implies (5.13)– see theorem 2.5 of [11]. Due to similarity to Lemma 20 (following the same splitting), we skip some details.

**Lemma 21.** Let \( \nu \in \mathcal{A}^\alpha, w = w_\nu \) be a continuous O-RV function and \( A, B \) hold. Let \( \epsilon > 0 \) and

\[
K_\epsilon^\lambda (t, x) = e^{-\lambda t} L^\nu \epsilon \frac{\partial}{\partial y} \nu^* (t, x) \chi_{[\epsilon, \infty]} (t), t > 0, x \in \mathbb{R}^d,
\]

where \( \nu^* (dy) = \nu (-dy) \). There exists \( C_0 > 0 \) and \( N > 0 \) such that for all \( |s| \leq w (\eta), |y| \leq \eta, \eta > 0 \), we have

\[
(5.16) \quad \mathcal{I} = \int \left[ \int \chi_{Q_{C_0\eta}} (0) \epsilon \left| K_\epsilon^\lambda (t - s, x - y) - K_\epsilon^\lambda (t, x) \right| dx \right] dt \leq N,
\]

where \( Q_{C_0\eta} (0) = (-w (C_0\eta), w (C_0\eta)) \times \{ x : |x| < C_0\eta \} \).

**Proof.** By Lemma 1 we choose \( C_0 > 3 \) such that \( w (C_0\eta) > 3 w (\eta), \eta > 0 \). We split

\[
\mathcal{I} = \int_{-\infty}^{2|s|} \left[ \int \ldots \right] dt + \int_{2|s|}^{\infty} \left[ \int \ldots \right] dt = \mathcal{I}_1 + \mathcal{I}_2.
\]

Since \( w (C_0\eta) > 3 w (\eta), \eta > 0 \), it follows by Lemma 10, Lemma 1, and Corollary 1 with \( k_0 = C_0 - 1 \) and \( \beta \in (0, \frac{\alpha}{\nu}) \),

\[
|\mathcal{I}_1| \leq C \int_0^{3|s|} \left[ \int_{|x| > k_0 a (|s|)} \left| L^\nu \frac{\partial}{\partial y} \nu^* (t, x) \right| dx \right] dt \\
\leq C \int_0^{3|s|} \left( t^{-\frac{\alpha}{2} a (t)^2 (k_0 a (|s|))^\beta} \right)^2 dt \leq C a (|s|)^{-2\beta} \int_0^{3|s|} a (t)^{2\beta} \frac{dt}{t} \\
\leq C a (s)^{-2\beta} a (3|s|)^{2\beta} \leq C
\]
Now,

\[ |I_2| \leq \int_{2|s|}^{\infty} \left( \int_{2|s|}^{\infty} \chi_{Q_{C_0}(0)}(t) \left| L^{\nu_2} p^{\nu} (t - s, x - y) - L^{\nu_2} p^{\nu} (t - s, x) \right| dx \right)^2 dt \]

We split the estimate of \( I_{2,1} \) into two cases.

**Case 1.** Assume \(|y| \leq a(2|s|)\). Then by Lemma 10, Lemma 1 and Corollary 1,

\[ I_{2,1} \leq C \int_{2|s|}^{\infty} \frac{|y|^2}{(t - s)^2} dt \]

\[ \leq C |y|^2 \int_{2|s|}^{\infty} \frac{1}{a(t - s)^2} (t - s)^{-1} dt \]

\[ \leq C |y|^2 \int_{|s|}^{\infty} a(t)^{-2} \frac{dt}{t} \leq C |y|^2 a(|s|)^{-2} \leq C \]

**Case 2.** Assume \(|y| > a(2|s|)\) i.e. \( \eta \geq |y| > a(2|s|) \) and \( a^{-1}(\eta) \geq a^{-1}(|y|) \geq 2|s| \). We split

\[ I_{2,1} = \int_{2|s|}^{2|s| + a^{-1}(|y|)} \left[ \int \ldots \right]^2 + \int_{2|s| + a^{-1}(|y|)}^{\infty} \left[ \int \ldots \right]^2 = I_{2,1,1} + I_{2,1,2}. \]

Hence, with \( \beta \in (0, \frac{\alpha_2}{2}) \), by Lemma 10, Lemma 1 and Corollary 1,

\[ I_{2,1,1} \leq C \int_{2|s|}^{2|s| + a^{-1}(|y|)} \left[ \int_{|x| > a(2|s|) + |y|} \left| L^{\nu_2} p^{\nu} (t - s, x) \right| dx \right]^2 dt \]

\[ \leq C \frac{C}{(a(2|s|) + |y|)^{2\beta}} \int_{2|s|}^{2|s| + a^{-1}(|y|)} a(t)^{2\beta} \frac{dt}{(t - s)} \]

\[ \leq \frac{C}{(a(2|s|) + |y|)^{2\beta}} a(3|s| + a^{-1}(|y|))^{2\beta} \leq C \]

Then by Lemma 10 and Corollary 1,

\[ I_{2,1,2} \leq C \int_{2|s| + a^{-1}(|y|)}^{\infty} \left[ \int_{\mathbb{R}^d} \left| L^{\nu_2} p^{\nu} (t - s, x - y) - L^{\nu_2} p^{\nu} (t - s, x) \right| dx \right]^2 dt \]

\[ \leq C \int_{2|s| + a^{-1}(|y|)}^{\infty} \frac{|y|^2}{a(t - s)^2} \frac{dt}{t - s} \leq C |y|^2 a(2|s| + a^{-1}(|y|) - s)^{-2} \]

\[ \leq C |y|^2 a(|s| + a^{-1}(|y|))^{-2} \leq C \]
Hence, \( I_{2,1} \leq C \). Since

\[
I_{2,2} \leq \int_{|z|} ^{\infty} \int \chi_{\mathbb{E}_{\mathbb{C}^0}(0)} \left| L^{\nu^*} p^{\nu^*} (t - s, x) - L^{\nu^*} p^{\nu^*} (t, x) \right| \, dx \, dt
\]

\[
+ \int_{|z|} ^{\infty} \int \left| L^{\nu^*} p^{\nu^*} (t, x) \right| \, dx \, dt
\]

\[
= I_{2,2,1} + I_{2,2,2},
\]

it follows by Lemma \( 10 \) that

\[
I_{2,2,1} \leq \int_{2|z|} ^{\infty} \int \chi_{\mathbb{E}_{\mathbb{C}^0}(0)} \left| L^{\nu^*} p^{\nu^*} (t - s, x) - L^{\nu^*} p^{\nu^*} (t, x) \right| \, dx \, dt
\]

\[
\leq C.
\]

Clearly, \( I_{2,2,2} \leq C \) as well. \( \square \)

**Remark 6.** The estimates in Lemmas \( 20 \) and \( 21 \) are independent of \( \epsilon > 0 \). Now, Lemmas \( 17, 18, 20, 21, 5.8, 5.12, \) and \( 5.13 \) allow us to derive all the estimates of \( |u|_{L^p(E)} \) and \( |L^\nu u|_{L^p(E)}, s = 0 \) claimed in Theorem \( 7 \) for the solution \( u \) of \( (1.1) \) with smooth input functions.

We now prove the main theorem for general inputs.

### 5.4. Proof of the main Theorem.

We finish the proof of Theorem \( 1 \) in a standard way. Since by Proposition \( 1 \), \( J^1 : \mathbb{H}^{s,t} (\mathbb{R}^d, l_2) \to \mathbb{H}^{s-t} (\mathbb{R}^d, l_2) \), \( J^l : \mathbb{H}^{s,t} (\mathbb{R}^d) \to \mathbb{H}^{s-t} (\mathbb{R}^d) \) and \( J^l : \mathbb{H}^{s,t} (\mathbb{R}^d) \to \mathbb{H}^{s-t} (\mathbb{R}^d) \) is an isomorphism for any \( s, t \in \mathbb{R} \), it is enough to derive the statement for \( s = 0 \).

Let \( f \in \mathbb{L}_p(E) \), \( g \in \mathbb{H}^{1/p}(\mathbb{R}^d) \), and

\[
\Phi \in \mathbb{H}^{1/p}(\mathbb{R}^d) \cap \mathbb{H}^{1/p}(\mathbb{R}^d)
\]

and

\[
\Phi \in \mathbb{H}^{1/p}(\mathbb{R}^d) \text{ if } p \in (1, 2).
\]

According to Lemma \( 16 \), there are sequences \( f_n \in \mathbb{C}^{\infty}(\mathbb{R}^d) \), \( g_n \in \mathbb{C}^{\infty}(\mathbb{R}^d) \), \( \Phi_n \in \mathbb{C}^{\infty}(\mathbb{R}^d) \) if \( p \geq 2 \), and \( \Phi_n \in \mathbb{C}^{\infty}(\mathbb{R}^d) \) if \( p \in (1, 2) \), such that

\[
f_n \to f \text{ in } \mathbb{L}_p(E), \quad g_n \to g \text{ in } \mathbb{H}^{1/(p)}(\mathbb{R}^d),
\]

and

\[
\Phi_n \to \Phi \text{ in } \mathbb{H}^{1/(p)}(\mathbb{R}^d) \cap \mathbb{H}^{1/(p)}(\mathbb{R}^d) \text{ if } p \geq 2,
\]

\[
\Phi_n \to \Phi \text{ in } \mathbb{H}^{1/(p)}(\mathbb{R}^d) \text{ if } p \in (1, 2).
\]

For each \( n \), there is unique \( u_n \in \mathbb{C}^{\infty}(\mathbb{R}^d) \) solving \( (1.1) \). Hence for \( u_{n,m} = u_n - u_m \), we have

\[
\partial_t u_{n,m} = (L^\nu - \lambda) u_{n,m} + f_n - f_m + \int_U (\Phi_n - \Phi_m) q \, (dt, dz),
\]

\[
u_{n,m}(0, x) = g_n(x) - g_m(x), \ x \in \mathbb{R}^d.
\]
By estimates in Theorem 1 for smooth inputs (see Remark 6),
\[ |L^n u_{n,m}|_{L_p(E)} \leq C \left[ |f_n - f_m|_{L_p(E)} + |g_n - g_m|_{L^{p;1}}(\mathbb{R}^d) + |\Phi_n - \Phi_m|_{L^{p;1}}(\mathbb{R}^d) + |\Phi_n - \Phi_m|_{L^{p;1}}(\mathbb{R}^d) \right], \]
if \( p > 2 \) and
\[ |L^n u_{n,m}|_{L_p(E)} \leq C \left[ |f_n - f_m|_{L_p(E)} + |g_n - g_m|_{L^{p;1}}(\mathbb{R}^d) + |\Phi_n - \Phi_m|_{L^{p;1}}(\mathbb{R}^d) \right], \]
if \( p \in (1, 2) \).

By Lemma 17,
\[ |u_{n,m}|_{L_p(E)} \leq C[\rho_\lambda |f_n - f_m|_{L_p(E)} + \rho^{1/p}_\lambda |g_n - g_m|_{L_p(\mathbb{R}^d)} + \rho^{1/p}_\lambda |\Phi_n - \Phi_m|_{L^{p;1}}(\mathbb{R}^d)], \]
if \( p \geq 2 \), and
\[ |u_{n,m}|_{L_p(E)} \leq C[\rho_\lambda |f_n - f_m|_{L_p(E)} + \rho^{1/p}_\lambda |g_n - g_m|_{L_p(\mathbb{R}^d)} + \rho^{1/p}_\lambda |\Phi_n - \Phi_m|_{L^{p;1}}(\mathbb{R}^d)], \]
if \( p \in (1, 2) \). Hence there is \( u \in \mathbb{H}_p^{\nu;1}(E) \) so that \( u_n \to u \) in \( \mathbb{H}_p^{\nu;1}(E) \).

Moreover, by Lemma 17
\[ \sup_{t \leq T} |u_n(t) - u(t)|_{L_p(\mathbb{R}^d)} \to 0, \]
and \( u \) is \( L_p(\mathbb{R}^d) \)-valued continuous.

By Lemma 23 (see Appendix) and Remark 2,
\[ \sup_{t \leq T} \left| \int_0^t \int_U \Phi_n q(ds, dz) - \int_0^t \int_U \Phi q(ds, dz) \right|_{L_p(\mathbb{R}^d)} \to 0 \]
as \( n \to \infty \) in probability.

Hence (see (5.17)-(5.18)) we can pass to the limit in the equation (5.19)
\[ u_n(t) = g_n + \int_0^t [L^n u_n(s) - \lambda u_n(s) + f_n(s)]ds + \int_0^t \int_U \Phi_n q(ds, dz), 0 \leq t \leq T. \]

Obviously, (5.19) holds for \( u, g \) and \( f, \Phi \). We proved the existence part of Theorem 1.

**Uniqueness.** Assume \( u_1, u_2 \in \mathbb{H}_p^{\nu;1}(E) \) solve (5.1). Then \( u = u_1 - u_2 \in \mathbb{H}_p^{\nu;1}(E) \) solves (5.1) with \( f = 0, g = 0, \Phi = 0 \). Thus the uniqueness follows from the uniqueness of a deterministic equation (see [15]).

Theorem 1 is proved.
6. Appendix

6.1. A non-degeneracy estimate. We present a sufficient condition for our assumption $B$. For the sake of completeness we add the proof from [13], see Corollary 6, with an obvious modification.

Lemma 22. (Corollary 6 of [13]) Let $\nu \in \mathfrak{A}$,

$$
\nu (\Gamma) = - \int_{0}^{\infty} \int_{S_{d-1}} \chi_{\Gamma} (rz) \Pi (r, dz, \delta (r), \Gamma \in B (R^{d}) ,
$$

where $\delta = \delta_{\nu}, \Pi (r, dz), r > 0$ is a measurable family of measures on $S_{d-1}$ with $\Pi (r, S_{d-1}) = 1, r > 0$. Assume that $w = w_{\nu} = \delta_{\nu}^{-1}$ is an $O$-RV function at zero and infinity satisfying

$$
\inf_{|\xi| = 1} \int_{S_{d-1}} |\xi \cdot z|^{2} \Pi (r, dz) \geq c_{0} > 0, \quad r > 0
$$

and $|\{s \in [0, 1] : r_{i} (s) < 1\}| > 0, i = 1, 2$. Then assumption $B$ holds. That is

$$
\inf_{R \in (0, \infty), |\xi| = 1} \int_{|y| \leq 1} |\xi \cdot y|^{2} \bar{\nu}_{R} (dy) > 0
$$

Proof. Indeed, for $|\xi| = 1, R > 0$, with $C > 0$,

$$
\int_{|y| \leq 1} |\xi \cdot y|^{2} \nu_{R} (dy)
$$

$$
= R^{-2} \int_{|y| \leq R} |\xi \cdot y|^{2} \nu (dy) = - R^{-2} \int_{0}^{R} \int_{S_{d-1}} |\xi \cdot z|^{2} \Pi (r, dz) r^{2} d\delta (r)
$$

$$
\geq - R^{-2} c_{0} \int_{0}^{R} r^{2} d\delta (r) = c_{0} R^{-2} \int_{|y| \leq R} |y|^{2} \nu (dy) = c_{0} \int_{|y| \leq 1} |y|^{2} \nu_{R} (dy)
$$

Therefore,

$$
\int_{|y| \leq 1} |\xi \cdot y|^{2} \bar{\nu}_{R} (dy) \geq c_{0} \int_{|y| \leq 1} |y|^{2} \bar{\nu}_{R} (dy).
$$

Using computation similar to the proof of Lemma [4],

$$
\int_{|y| \leq 1} |y|^{2} \bar{\nu}_{R} (dy) = w (R) \int_{|y| \leq 1} |y|^{2} \nu_{R} (dy)
$$

$$
= 2 R^{-2} \int_{0}^{R} s^{2} \left[ \frac{w (R)}{w (s)} - 1 \right] \frac{ds}{s}
$$

$$
= 2 \int_{0}^{1} s^{2} \left[ \frac{w (R)}{w (Rs)} - 1 \right] \frac{ds}{s}
$$

By Fatou’s Lemma,

$$
\liminf_{R \to 0} \int_{|y| \leq 1} |y|^{2} \bar{\nu}_{R} (dy) \geq 2 \int_{0}^{1} s^{2} \left[ \frac{1}{r_{1} (s)} - 1 \right] \frac{ds}{s} = c_{1} > 0,
$$

$$
\liminf_{R \to \infty} \int_{|y| \leq 1} |y|^{2} \bar{\nu}_{R} (dy) \geq 2 \int_{0}^{1} s^{2} \left[ \frac{1}{r_{2} (s)} - 1 \right] \frac{ds}{s} = c_{2} > 0,
$$
Consequently, we define for each $x \in \mathbb{R}$ measure $\Pi$, $n$. Recall for each $n$, there is a constant $C$ such that for every $i = 1, 2$, completing the proof. 

6.2. Stochastic integral. We discuss here the definition of stochastic integrals with respect to a martingale measure. Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a complete probability space with a filtration of $\sigma$-algebras on $\mathbb{F} = (\mathcal{F}_t, t \geq 0)$ satisfying the usual conditions. Let $(U, \mathcal{U}, \Pi)$ be a measurable space with $\sigma$-finite measure $\Pi$, $R^d_0 = R^d \setminus \{0\}$. Let $p(dt, dz)$ be $\mathbb{F}$-adapted point measures on $([0, \infty) \times U, \mathcal{B}([0, \infty)) \otimes \mathcal{U})$ with compensator $\Pi(dz) dt$. We denote the martingale measure $q(dt, dz) = p(dt, dz) - \Pi(dz) dt$.

We prove the following based on Lemma 12 from [16].

**Lemma 23.** Let $s \in \mathbb{R}$, $\Phi \in \mathbb{H}_{2,p}(E) \cap \mathbb{H}_{p,p}(E)$ for $p \in [2, \infty)$ and $\Phi \in \mathbb{H}_{p,p}(E)$ for $p \in [1, 2)$. There is a unique cadlag $\mathbb{H}_p^s(R^d)$-valued process

$$M(t) = \int_0^t \int \Phi(r, x, z) q(dr, dz), 0 \leq t \leq T, x \in R^d,$$

such that for every $\varphi \in \mathcal{S}(R^d)$,

$$(6.1) \quad \langle M(t), \varphi \rangle = \int_0^t \int \left( \int J^s \Phi(r, \cdot, z) J^{-s} \varphi dx \right) q(dr, dz), 0 \leq t \leq T.$$

Moreover, there is a constant $C$ independent of $\Phi$ such that

$$(6.2) \quad \mathbb{E} \sup_{t \leq T} \left| \int_0^t \int \Phi(r, \cdot, z) q(dr, dz) \right|_{\mathbb{H}_p^s(R^d)} \leq C \sum_{j=2,p} |\Phi|_{\mathbb{H}_{j,p}(E)}, p \geq 2,$$

$$\mathbb{E} \sup_{t \leq T} \left| \int_0^t \int \Phi(r, \cdot, z) q(dr, dz) \right|_{\mathbb{H}_p^s(R^d)} \leq C |\Phi|_{\mathbb{H}_{p,p}(E)}, p \in (1, 2).$$

**Proof.** According to Proposition [1] it is enough to consider the case $s = 0$. Let $\Phi_n$ be a sequence defined in Lemma [15] that approximates $\Phi$. Note first that by Lemma [15] for all $x$,

$$\mathbb{E} \int_0^T \sup_x \int |D^\gamma \Phi_n(r, x, z)|^p \Pi(dz) dr < \infty.$$

Recall for each $n$, we have $\Phi_n = \Phi_n \chi_{U_n}$ for some $U_n \in \mathcal{U}$ with $\Pi(U_n) < \infty$. Consequently, we define for each $x \in R^d$ and $\mathbb{P}$-a.s. for all $(t, x) \in E$,

$$M_n(t, x) = \int_0^t \int \Phi_n(r, x, z) q(dr, dz) = \int_0^t \int \Phi_n(r, x, z) p(dr, dz) - \int_0^t \int \Phi_n(r, x, z) \Pi(dz) dr.$$
Obviously, $M_n(t, x)$ is cadlag in $t$ and infinitely differentiable in $x$. Obviously, $M_n(t) = M_n(t, \cdot)$ is $L_p(\mathbb{R}^d)$-valued cadlag and, by Kunita’s inequality (Theorem 2.11 of [19]), there is a constant $C$ independent of $\Phi_n$ such that

$$
E \sup_{t \leq T} |M_n(t)|^p_{L_p(\mathbb{R}^d)} \leq CE \sum_{j=2}^{\infty} |\Phi_n|_{L^p_j(E)}^p, 2 \leq p < \infty.
$$

By BDG inequality, for $1 < p < 2$,

$$
E \sup_{t \leq T} |M_n(t, x)|^p \leq CE \left[ \left( \int_0^T \int |\Phi_n(r, x, z)|^2 p(dr, dz) \right)^{\frac{p}{2}} \right] \leq CE \left[ \int_0^T \int |\Phi_n(r, x, z)|^p p(dr, dz) \right] \leq CE \left[ \int_0^T \int |\Phi_n(r, x, z)|^p dr \Pi(dz) \right].
$$

Hence, by integrating in $x$,

$$
E \sup_{t \leq T} |M_n(t)|^p_{L_p(\mathbb{R}^d)} \leq CE |\Phi_n|_{L_p^p(E)}^p.
$$

In addition, by Fubini theorem, $\mathbb{P}$-a.s. for $0 \leq t \leq T, \varphi \in \mathcal{S}(\mathbb{R}^d)$,

$$
\langle M_n(t), \varphi \rangle = \int M_n(t, x) \varphi(x) dx = \int_0^t \int \left( \int \Phi_n(r, x, z) \varphi(x) dx \right) q(dr, dz).
$$

By Lemma [15]

$$
E \sum_{j=2}^{\infty} |\Phi_n - \Phi|^p_{L^p_j(\mathbb{R}^d)} \to 0, 2 \leq p < \infty,
$$

$$
E |\Phi_n - \Phi|^p_{L^p_p(E)} \to 0, p \in (1, 2).
$$

Similarly, for each $p \in [2, \infty)$,

$$
E \sup_{t \leq T} |M_n(t) - M_m(t)|^p_{L_p(\mathbb{R}^d)} \leq CE \sum_{j=2}^{\infty} |\Phi_n - \Phi_m|^p_{L^p_j(E)} \to 0,
$$

and for each $p \in (1, 2)$

$$
E \sup_{t \leq T} |M_n(t) - M_m(t)|^p_{L_p(\mathbb{R}^d)} \leq CE |\Phi_n - \Phi_m|^p_{L^p_p(E)} \to 0,
$$

as $n, m \to \infty$. Therefore there is an adapted cadlag $L_p(\mathbb{R}^d)$-valued process $M(t)$ so that

$$
E \sup_{t \leq T} |M_n(t) - M(t)|^p_{L_p(\mathbb{R}^d)} \to 0
$$

as $n \to \infty$. Passing to the limit as $n \to \infty$ in (6.3), (6.4) and (6.5) we derive (6.2), (6.1). Henceforth, we define $\int_0^t \int \Phi(r, x, z) q(dr, dz)$ to be $M(t)$ in this lemma. \qed
