Abstract

The purpose of this paper is to generalize some results on n -Lie algebras and n -Hom-Lie algebras to n -Hom-Lie color algebras. Then we introduce and give some constructions of n -Hom-Lie color algebras.

Keywords: n -Hom-Lie color algebras, color modules, averaging, semi-morphism, morphism.

Mathematics Subject Classification (2010): 17A40, 17A42, 17B30, 17B55

1 Introduction

The investigations of various q -deformations (quantum deformations) of Lie algebras began a period of rapid expansion in 1980's stimulated by introduction of quantum groups motivated by applications to the quantum Yang-Baxter equation, quantum inverse scattering methods and constructions of the quantum deformations of universal enveloping algebras of semi-simple Lie algebras. In [2, 24–27, 29–31, 38, 39, 53–55] various versions of q -deformed Lie algebras appeared in physical contexts such as string theory, vertex models in conformal field theory, quantum mechanics and quantum field theory in the context of

q -deformations of infinite-dimensional algebras, primarily the q -deformed Heisenberg algebras [37], q -deformed oscillator algebras and q -deformed Witt and q -deformed Virasoro algebras, and some interesting q -deformations of the Jacobi identity for Lie algebras in these q -deformed algebras were observed.

Hom-Lie algebras and more general quasi-hom-Lie algebras were introduced first by Larsson, Hartwig and Silvestrov [36], where the general quasi-deformations and discretizations of Lie algebras of vector fields using more general σ -derivations (twisted derivations) and a general method for construction of deformations of Witt and Virasoro type algebras based on twisted derivations have been developed, initially motivated by the q -deformed Jacobi identities observed for the q -deformed algebras in physics, along with q -deformed versions of homological algebra and discrete modifications of differential calculi. The general abstract quasi-Lie algebras and the subclasses of quasi-Hom-Lie algebras and Hom-Lie algebras as well as their general color (graded) counterparts have been introduced in [36, 48–50, 63]. Subsequently, various classes of hom-Lie admissible algebras have been considered in [57]. In particular, in [57], the hom-associative algebras have been introduced and shown to be hom-Lie admissible, that is leading to hom-Lie algebras using commutator map as new product, and in this sense constituting a natural generalization of associative algebras, as Lie admissible algebras leading to Lie algebras via commutator map as new product. In [57], moreover several other interesting classes of hom-Lie admissible algebras generalising some classes of non-associative algebras, as well as examples of finite-dimensional hom-Lie algebras have been described. Since these pioneering works [36, 48–51, 57], hom-algebra structures have developed in a popular broad area with increasing number of publications in various directions. In hom-algebra structures, defining algebra identities are twisted by linear maps. This same idea was then generalized to various types of algebras in [57]. Hom-algebra structures of a given type include their classical counterparts and open more possibilities for deformations, extensions of cohomological structures and representations (see for example [3, 22, 48, 60] and references therein).

Ternary algebras and more generally n -ary Lie algebras first appeared in Nambu's generalization of Hamiltonian mechanics, using a ternary generalization of Poisson algebras. The mathematical algebraic foundations of Nambu mechanics have been developed by Takhtajan and Daletskii in [32, 64, 65]. Filippov, in [34] introduced n -Lie algebras and then Kasymov [40] deeper investigated their properties. This approach uses the interpretation of Jacobi identity expressing the fact that the adjoint map is a derivation. There is also another type of n -ary Lie algebras, in which the n -ary Jacobi identity is the sum over S_{2n-1} instead of S_3 in the binary case. One reason for studying such algebras was that n -Lie algebras introduced by Filippov were mostly rigid, and these algebras offered more possibilities to this regard. Besides Nambu mechanics, n -Lie algebras revealed to have many applications in physics.

The n -Lie algebras found their applications in many fields of mathematics and Physics. For instance, Takhtajan has developed the foundations of the theory of Nambu-Poisson

manifolds [64]. The general cohomology theory for n -Lie algebras and Leibniz n -algebras was established in [61]. The structure and classification theory of finite dimensional n -Lie algebras was given by Ling [52] and many other authors. For more details of the theory and applications of n -Lie algebras, see [33] and references therein. Generalized derivations of Lie color algebras and n -ary (color) algebras have been studied in [28, 41–44], and generalizations of derivations in connection with extensions and enveloping algebras of hom-Lie color algebras have been considered in [5, 6]. Derivations, L-modules, L-comodules and Hom-Lie quasi-bialgebras have been considered in [20, 21]. In [23], Leibnitz n -algebras have been studied.

Hom-type generalization of n -ary algebras, such as n -Hom-Lie algebras and other n -ary Hom algebras of Lie type and associative type, were introduced in [10], by twisting the identities defining them using a set of linear maps, together with the particular case where all these maps are equal and are algebra morphisms. A way to generate examples of such algebras from non Hom-algebras of the same type is introduced. Further properties, construction methods, examples, cohomology and central extensions of n -ary Hom-algebras have been considered in [7–9, 45, 46, 66, 69]. The construction of $(n + 1)$ -Lie algebras induced by n -Lie algebras using combination of bracket multiplication with a trace, motivated by the work of Awata et al. [11] on the quantization of the Nambu brackets, was generalized using the brackets of general Hom-Lie algebra or n -Hom-Lie and trace-like linear forms depending on the linear maps defining the Hom-Lie or n -Hom-Lie algebras [8, 9].

Properties and classification of n -ary algebras, including solvability and nilpotency, were studied in [12–19, 40]. Kasymov [40] pointed out that n -ary multiplication allows for several different definitions of solvability and nilpotency in n -Lie algebras, and studied their properties. The aim of this paper is to extend these definitions and properties to n -Hom-Lie algebras and to apply them to the case of $(n + 1)$ -Hom-Lie algebras induced by n -Hom-Lie algebras.

The purpose of this paper is to generalize some results on either n -Lie algebras or n -Hom-Lie algebras to the case of n -Hom-Lie color algebras. Then we introduce and give some constructions n -Hom-Lie color algebras. Section 2 contains some necessary important basic notions and notations on graded spaces and algebras and n -ary algebras and used in other sections. Section 3 presents some useful methods for construction of n -Hom-Lie color algebras. In Section 4, Hom-modules over n -Hom-Lie color algebras are considered. Section 5 is devoted to generalized derivation of color Hom-algebras and their color Hom-subalgebras.

Throughout this paper, all graded linear spaces are assumed to be over a field \mathbb{K} of characteristic different from 2.

2 Preliminaries

This section contains necessary important basic notions and notations on graded spaces and algebras and n -ary algebras used in other sections.

Definition 2.1. *Let G be an abelian group.*

- 1) *A linear space V is said to be a G -graded if, there exists a family $(V_a)_{a \in G}$ of linear subspaces of V such that*

$$V = \bigoplus_{a \in G} V_a.$$

- 2) *An element $x \in V$ is said to be homogeneous of degree $a \in G$ if $x \in V_a$. We denote $\mathcal{H}(V)$ the set of all homogeneous elements in V .*

- 3) *Let $V = \bigoplus_{a \in G} V_a$ and $V' = \bigoplus_{a \in G} V'_a$ be two G -graded linear spaces. A linear mapping $f : V \rightarrow V'$ is said to be homogeneous of degree b if*

$$f(V_a) \subseteq V'_{a+b}, \quad \text{for all } a \in G.$$

If, f is homogeneous of degree zero i.e. $f(V_a) \subseteq V'_a$ holds for any $a \in G$, then f is said to be even.

Definition 2.2. 1) *An algebra (A, \cdot) is said to be G -graded if its underlying linear space is G -graded i.e. $A = \bigoplus_{a \in G} A_a$, and if furthermore*

$$A_a \cdot A_b \subseteq A_{a+b}, \quad \text{for all } a, b \in G.$$

- 2) *A morphism $f : A \rightarrow A'$ of G -graded algebras A and A' is by definition an algebra morphism from A to A' which is, in addition an even mapping.*

Definition 2.3. *Let G be an abelian group. A map $\varepsilon : G \times G \rightarrow \mathbb{K}^*$ is called a skew-symmetric bicharacter on G if the following identities hold for all $a, b, c \in G$:*

- (i) $\varepsilon(a, b)\varepsilon(b, a) = 1$,
- (ii) $\varepsilon(a, b+c) = \varepsilon(a, b)\varepsilon(a, c)$,
- (iii) $\varepsilon(a+b, c) = \varepsilon(a, c)\varepsilon(b, c)$,

If x and y are two homogeneous elements of degree a and b respectively and ε is a skew-symmetric bicharacter, then we shorten the notation by writing $\varepsilon(x, y)$ instead of $\varepsilon(a, b)$.

Example 2.4. *Some standard examples of skew-symmetric bicharacters are:*

- 1) $G = \mathbb{Z}_2$, $\varepsilon(i, j) = (-1)^{ij}$, or more generally

$$G = \mathbb{Z}_2^n = \{(\alpha_1, \dots, \alpha_n) \mid \alpha_i \in \mathbb{Z}_2\},$$

$$\varepsilon((\alpha_1, \dots, \alpha_n), (\beta_1, \dots, \beta_n)) := (-1)^{\alpha_1\beta_1 + \dots + \alpha_n\beta_n}.$$

- 2) $G = \mathbb{Z}_2 \times \mathbb{Z}_2$, $\varepsilon((i_1, i_2), (j_1, j_2)) = (-1)^{i_1 j_2 - i_2 j_1}$,
- 3) $G = \mathbb{Z} \times \mathbb{Z}$, $\varepsilon((i_1, i_2), (j_1, j_2)) = (-1)^{(i_1 + i_2)(j_1 + j_2)}$,
- 4) $G = \{-1, +1\}$, $\varepsilon(i, j) = (-1)^{(i-1)(j-1)/4}$.

Definition 2.5. An n -Lie algebra is a linear spaces V equipped with n -ary operation which is skew-symmetric for any pair of variables and satisfies the following identity:

$$\begin{aligned} & [x_1, \dots, x_{n-1}, [y_1, \dots, y_n]] = \\ & = \sum_{i=1}^n [y_1, \dots, y_{i-1}, [x_1, \dots, x_{n-1}, y_i], y_{i+1}, \dots, y_n]. \end{aligned} \quad (1)$$

Definition 2.6. An n -Hom-Lie color algebra is a graded linear space $L = \bigoplus L_a, a \in G$ with an n -linear map $[\dots, \cdot] : L \times \dots \times L \rightarrow L$, a bicharacter $\varepsilon : G \times G \rightarrow \mathbf{K}^*$ and an even linear map $\alpha : L \rightarrow L$ such that

$$\begin{aligned} [x_1, \dots, x_i, x_{i+1}, \dots, x_n] &= -\varepsilon(x_i, x_{i+1}) [x_1, \dots, x_{i+1}, x_i, \dots, x_n], \\ & i = 1, 2, \dots, n-1. \end{aligned} \quad (2)$$

$$\begin{aligned} & [\alpha(x_1), \dots, \alpha(x_{n-1}), [y_1, y_2, \dots, y_n]] = \\ & = \sum_{i=1}^n \varepsilon(X, Y_i) [\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \dots, \alpha(y_n)] \end{aligned} \quad (3)$$

where $x_i, y_j \in \mathcal{H}(L)$, $X = \sum_{i=1}^{n-1} x_i$, $Y_i = \sum_{j=1}^i y_{j-1}$ and $y_0 = e$.

Remark 2.7. Whenever $n = 2$ (resp. $n = 3$) we recover Hom-Lie color algebras (resp. ternary Hom-Lie color algebras).

Remark 2.8. 1) When $\alpha = id$, we get n -Lie color algebra.

2) When $G = \{e\}$ and $\alpha = id$, we get n -Lie algebra.

3) When $G = \{e\}$ and $\alpha \neq id$, we get n -Hom-Lie algebra.

Definition 2.9. A morphism $f : (L, [\dots, \cdot], \varepsilon, \alpha) \rightarrow (L', [\dots, \cdot]', \varepsilon, \alpha')$ of an n -Hom-Lie color algebras is an even linear map $f : L \rightarrow L$ such that $f \circ \alpha = \alpha' \circ f$ and for any $x_i \in \mathcal{H}(L)$,

$$f([x_1, \dots, x_n]) = [f(x_1), \dots, f(x_n)]'$$

Definition 2.10. 1) An n -Hom-Lie color algebra $(L, [\dots, \cdot], \varepsilon, \alpha)$ is said to be multiplicative if α is an endomorphism, i.e. a linear map on L which is also a homomorphism with respect to multiplication $[\dots, \cdot]$.

2) An n -Hom-Lie color algebra $(L, [\dots, \cdot], \varepsilon, \alpha)$ is said to be regular if α is an automorphism.

3) An n -Hom-Lie color algebra $(L, [\dots, \cdot], \varepsilon, \alpha)$ is said to be involutive if $\alpha^2 = id$.

Example 2.11. Let $G = \mathbb{Z}_2$, $\varepsilon(i, j) = (-1)^{ij}$, $L = L_0 \oplus L_1 = \langle e_2, e_4 \rangle \oplus \langle e_1, e_3 \rangle$,

$$[e_1, e_2, e_3] = e_2, \quad [e_1, e_2, e_4] = e_1, \quad [e_1, e_3, e_4] = [e_2, e_3, e_4] = 0,$$

and $\alpha(e_1) = e_3$, $\alpha(e_2) = e_4$, $\alpha(e_3) = \alpha(e_4) = 0$. Then $(L, [\cdot, \cdot, \cdot], \varepsilon, \alpha)$ is a 3-Hom-Lie color algebra.

Example 2.12. Let L be a graded linear space

$$L = L_{(0,0)} \oplus L_{(0,1)} \oplus L_{(1,0)} \oplus L_{(1,1)}$$

with $L_{(0,0)} = \langle e_1, e_2 \rangle$, $L_{(0,1)} = \langle e_3 \rangle$, $L_{(1,0)} = \langle e_4 \rangle$, $L_{(1,1)} = \langle e_5 \rangle$. The 4-ary even linear multiplication $[\cdot, \cdot, \cdot, \cdot] : L \times L \times L \times L \rightarrow L$ defined for basis $\{e_i \mid i = 1, \dots, 5\}$ by

$$\begin{aligned} [e_2, e_3, e_4, e_5] &= e_1, [e_1, e_3, e_4, e_5] = e_2, [e_1, e_2, e_4, e_5] = e_3, \\ [e_1, e_2, e_3, e_4] &= 0, [e_1, e_2, e_3, e_5] = 0 \end{aligned}$$

makes L into the five dimensional 4-Lie color algebra.

Now define on $(L, [\cdot, \cdot, \cdot, \cdot], \varepsilon)$ an even endomorphism $\alpha : L \rightarrow L$ by

$$\alpha(e_1) = e_2, \quad \alpha(e_2) = e_1, \quad \alpha(e_i) = e_i, \quad i = 3, 4, 5.$$

Then $L_\alpha = (L, [\cdot, \cdot, \cdot, \cdot]_\alpha, \varepsilon, \alpha)$ is a 4-Hom-Lie color algebra. Observe that α is involutive (hence bijective).

Definition 2.13. A graded subspace H of an n -Hom-Lie color algebra L is a color Hom-subalgebra of L if

- i) $\alpha(H) \subseteq H$,
- ii) $[H, H, \dots, H] \subseteq H$.

Definition 2.14. Let L_1, L_2, \dots, L_n be Hom-subalgebras of an n -Hom-Lie color algebra L . Denote by $[L_1, L_2, \dots, L_n]$ the Hom-subalgebra of L generated by all elements $[x_1, x_2, \dots, x_n]$, where $x_i \in L_i, i = 1, 2, \dots, n$.

- i) The sequence $L_1, L_2, \dots, L_n, \dots$ defined by

$$\begin{aligned} L_0 &= L, \quad L_1 = [L_0, L_0, \dots, L_0], \quad L_2 = [L_1, L_1, \dots, L_1], \dots, \\ L_n &= [L_{n-1}, L_{n-1}, \dots, L_{n-1}], \dots \end{aligned}$$

is called the derived sequence.

- ii) The sequence $L^1, L^2, \dots, L^n, \dots$ defined by

$$\begin{aligned} L^0 &= L, \quad L^1 = [L^0, L, \dots, L], \quad L^2 = [L^1, L, \dots, L], \dots, \\ L^n &= [L^{n-1}, L, \dots, L], \dots \end{aligned}$$

is called the descending central sequence.

iii) The graded subspace $Z(L)$ defined by

$$Z(L) = \{x \in L \mid [x, L, L, \dots, L] = 0\} \quad (4)$$

is called the center of L .

Definition 2.15. A Hom-ideal I of an n -Hom-Lie color algebra L is a graded subspace of L such that $\alpha(I) \subseteq I$ and $[I, L, \dots, L] \subseteq I$.

Theorem 2.16. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra with surjective twisting map $\alpha : L \rightarrow L$. Then, I_n, I^n and $Z(L)$ are Hom-ideals of L .

Proof. We only prove, by induction, that I_n is a Hom-ideal. For this, suppose, first, that I_{n-1} is a Hom-subalgebra of L and show that I_n is a Hom-subalgebra of L . For any $y \in \mathcal{H}(I_n)$, there exist $y_1, y_2, \dots, y_n \in \mathcal{H}(I_{n-1})$, such that

$$y = [y_1, y_2, \dots, y_n].$$

So, $\alpha(y) = \alpha([y_1, y_2, \dots, y_n]) = [\alpha(y_1), \alpha(y_2), \dots, \alpha(y_n)]$, which belong to I_n because I_{n-1} is a Hom-subalgebra. That is $\alpha(I_n) \subseteq I_n$.

For any $y_i \in \mathcal{H}(I_n)$, there exist $y_i^1, y_i^2, \dots, y_i^n \in I_{n-1}, i = 1, 2, \dots, n$ such that

$$[y_1, y_2, \dots, y_n] = [[y_1^1, y_1^2, \dots, y_1^n], [y_2^1, \dots, y_2^n], \dots, [y_n^1, \dots, y_n^n]].$$

I_{n-1} being a Hom-subalgebra, by hypotheses, $[y_i^1, y_i^2, \dots, y_i^n] \in I_{n-1}$ for $1 \leq i \leq n$, and so $[y_1, y_2, \dots, y_n] \in I_n$. Thus I_n is a Hom-subalgebra.

Now, suppose that I_{n-1} is a Hom-ideal. Let $x'_1, \dots, x'_{n-1} \in L, y \in I_n$, then there exist $x_1, \dots, x_{n-1} \in L, y_1, \dots, y_n \in I_{n-1}$ such that

$$\begin{aligned} [x'_1, \dots, x'_{n-1}, y] &= [\alpha(x_1), \dots, \alpha(x_{n-1}), [y_1, \dots, y_n]] \\ &= \sum_{i=1}^n \varepsilon(X, Y_i) [\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \alpha(y_n)] \end{aligned}$$

As $[x_1, \dots, x_{n-1}, y_i] \in I_{n-1}$, then $[x'_1, \dots, x'_{n-1}, y] \in I_n$. So, I_n is a Hom-ideal of L . \square

3 Constructions of n -Hom-Lie color algebras

In this section we present some useful methods for construction of n -Hom-Lie color algebras.

Proposition 3.1. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\xi \in L_e$ such that $\alpha(\xi) = \xi$. Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon, \alpha)$ is an $(n-1)$ -Hom-Lie color algebra with

$$\{x_1, \dots, x_{n-1}\} = [\xi, x_1, \dots, \dots, x_{n-1}].$$

Proof. With conditions in the statement,

$$\begin{aligned}
\{\alpha(x_1), \dots, \alpha(x_{n-2}), \{y_1, \dots, y_{n-1}\}\} &= [\xi, \alpha(x_1), \dots, \alpha(x_{n-2}), [\xi, y_1, \dots, y_{n-1}]] \\
&= [\alpha(\xi), \alpha(x_1), \dots, \alpha(x_{n-2}), [\xi, y_1, \dots, y_{n-1}]] \\
&= [[\xi, x_1, \dots, x_{n-2}, \xi], \alpha(y_1), \dots, \alpha(y_{n-1})] \\
&+ \sum_{i=i}^{n-1} \varepsilon(X, Y_i) [\xi, \alpha(y_1), \dots, \alpha(y_{i-1}), [\xi, x_1, \dots, x_{n-2}, y_i], \alpha(y_{i+1}), \dots, \alpha(y_{n-1})] \\
&= \sum_{i=i}^{n-1} \varepsilon(X, Y_i) \{\alpha(y_1), \dots, \alpha(y_{i-1}), \{x_1, \dots, x_{n-2}, y_i\}, \alpha(y_{i+1}), \dots, \alpha(y_{n-1})\}.
\end{aligned}$$

which completes the proof. \square

Corollary 3.2. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\xi_i \in L_e$ such that $\alpha(\xi_i) = \xi_i, i = 1, 2, \dots, k$. Then $L_k = (L, \{\cdot, \dots, \cdot\}_k, \varepsilon, \alpha)$ is an $(n - k)$ -Hom-Lie color algebra with $\{x_1, \dots, x_{n-k}\}_k = [\xi_1, \dots, \xi_k, x_1, \dots, x_{n-k}]$.*

Corollary 3.3. *Let $(L, [\cdot, \dots, \cdot], \varepsilon)$ be an n -Lie color algebra and $\xi \in L_e$. Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon)$ is an $(n - 1)$ -Lie color algebra with*

$$\{x_1, \dots, x_{n-1}\} = [\xi, x_1, \dots, x_{n-1}].$$

Theorem 3.4. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and β be an even endomorphism of L . Then $L_\beta = (L, \{\cdot, \dots, \cdot\} = \beta[\cdot, \dots, \cdot], \varepsilon, \beta\alpha)$ is an n -Hom-Lie color algebra. Moreover suppose that $(L', [\cdot, \dots, \cdot]', \varepsilon, \alpha')$ is another n -Hom-Lie color algebra and β' be an even endomorphism of L' . If $f : (L, [\cdot, \dots, \cdot], \varepsilon, \alpha) \rightarrow (L', [\cdot, \dots, \cdot]', \varepsilon, \alpha')$ is a morphism such that $f\beta = \beta'f$, then $f : L_\beta \rightarrow L_{\beta'}$ is also a morphism.*

Proof. First part is proved as follows:

$$\begin{aligned}
\{\beta\alpha(x_1), \dots, \beta\alpha(x_{n-1}), \{y_1, \dots, y_n\}\} &= \beta([\beta\alpha(x_1), \dots, \beta\alpha(x_{n-1}), \beta[y_1, \dots, y_n]]) \\
&= \beta^2\left([\alpha(x_1), \dots, \alpha(x_{n-1}), [y_1, y_2, \dots, y_n]]\right) \\
&= \beta^2\left(\sum_{i=1}^n \varepsilon(X, Y_i) [\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \dots, \alpha(y_n)]\right) \\
&= \sum_{i=1}^n \varepsilon(X, Y_i) \beta^2\left([\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \dots, \alpha(y_n)]\right) \\
&= \sum_{i=1}^n \varepsilon(X, Y_i) \beta[\beta\alpha(y_1), \dots, \beta\alpha(y_{i-1}), \beta[x_1, \dots, x_{n-1}, y_i], \beta\alpha(y_{i+1}), \dots, \beta\alpha(y_n)] \\
&= \sum_{i=1}^n \varepsilon(X, Y_i) \{\beta\alpha(y_1), \dots, \beta\alpha(y_{i-1}), \{x_1, \dots, x_{n-1}, y_i\}, \beta\alpha(y_{i+1}), \dots, \beta\alpha(y_n)\}.
\end{aligned}$$

Second part is proved as follows:

$$\begin{aligned}
f(\{x_1, \dots, x_n\}) &= f([x_1, \dots, x_n]_\beta) = f\beta[x_1, \dots, x_n] = f[\beta(x_1), \dots, \beta(x_n)] \\
&= [f\beta(x_1), \dots, f\beta(x_n)]' = [\beta'f(x_1), \dots, \beta'f(x_n)]' \\
&= \beta'[f(x_1), \dots, f(x_n)]' = [f(x_1), \dots, f(x_n)]'_{\beta'} \\
&= \{f(x_1), \dots, f(x_n)\}'
\end{aligned}$$

This completes the proof. \square

Taking $\beta = \alpha^n$ leads to the following statement.

Corollary 3.5. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. Then, for any positive integer n , $(L, \alpha^n[\cdot, \dots, \cdot], \varepsilon, \alpha^{n+1})$ is also an n -Hom-Lie color algebra.*

Taking $\beta = \alpha$ and $\alpha = id$ leads to the following statement.

Corollary 3.6. *Let $(L, [\cdot, \dots, \cdot], \varepsilon)$ be an n -Lie color algebra and α be an even endomorphism of L . Then $L_\alpha = (L, \{\cdot, \dots, \cdot\} = \alpha[\cdot, \dots, \cdot], \varepsilon, \alpha)$ is a multiplicative n -Hom-Lie color algebra.*

Taking $\beta \in \text{Aut}(L)$, $\beta = \alpha^{-1}$ leads to the following statement.

Corollary 3.7. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a regular n -Hom-Lie color algebra. Then*

$$L_{\alpha^{-1}} = (L, \{\cdot, \dots, \cdot\} = \alpha^{-1}[\cdot, \dots, \cdot], \varepsilon)$$

is an n -Lie color algebra.

Taking $\beta = \alpha$ leads to the following statement.

Corollary 3.8. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an involutive n -Hom-Lie color algebra. Then*

$$L_\beta = (L, \{\cdot, \dots, \cdot\} = \alpha[\cdot, \dots, \cdot], \varepsilon)$$

is an n -Lie color algebra.

Theorem 3.9. *Let (A, \cdot) be a commutative associative algebra and $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra. The tensor product $A \otimes L = \sum_{g \in G} (A \otimes L)_g = \sum_{g \in G} A \otimes L_g$ with the bracket $[a_1 \otimes x_1, \dots, a_n \otimes x_n]' = a_1 \dots a_n \otimes [x_1, \dots, x_n]$, the even linear map $\alpha'(a \otimes x) := a \otimes \alpha(x)$ and the bicharacter $\varepsilon(a + x, b + y) = \varepsilon(x, y), \forall a, b \in A, \forall x, y \in \mathcal{H}(L)$, is an n -Hom-Lie color algebra.*

Proof. It follows from a straightforward computation. \square

In the next definition, we introduce an element of the centroid (or semi-morphism) for n -Hom-Lie color algebra.

Definition 3.10. A semi-morphism of an n -Hom-Lie color algebra $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is an even linear map $\beta : L \rightarrow L$ such that $\beta\alpha = \alpha\beta$ and $\beta[x_1, \dots, x_n] = [\beta(x_1), x_2, \dots, x_n]$.

Remark 3.11. Due to ε -skew-symmetry, $\beta[x_1, \dots, x_n] = [x_1, \dots, \beta(x_i), \dots, x_n]$.

Theorem 3.12. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\beta : L \rightarrow L$ a semi-morphism of L . Define a new multiplication $\{\cdot, \dots, \cdot\} : L \times \dots \times L \rightarrow L$ by

$$\{x_1, \dots, x_n\} = [x_1, \dots, \beta(x_i), \dots, x_n]$$

Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon, \alpha)$ is also an n -Hom-Lie color algebra.

Proof. The proof can be obtained as follows:

$$\begin{aligned} & \{\alpha(x_1), \dots, \alpha(x_{n-1}), \{y_1, \dots, y_n\}\} = \\ & = [\alpha(x_1), \dots, \beta\alpha(x_i), \dots, \alpha(x_{n-1}), [y_1, \dots, \beta(y_j), \dots, y_n]] \\ & = [\alpha(x_1), \dots, \alpha\beta(x_i), \dots, \alpha(x_{n-1}), [y_1, \dots, \beta(y_j), \dots, y_n]] \\ & = \sum_{k < j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_{k-1}), [x_1, \dots, \beta(x_i), \dots, x_{n-1}, y_k], \\ & \quad \alpha(y_{k+1}), \dots, \alpha\beta(y_j), \dots, \alpha(y_n)] \\ & + \varepsilon(X, Y_j) [\alpha(y_1), \dots, \alpha(y_{j-1}), [x_1, \dots, \beta(x_i), \dots, x_{n-1}, \beta(y_j)], \alpha(y_{j+1}), \dots, \alpha(y_n)] \\ & + \sum_{k > j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha\beta(y_j), \dots, \alpha(y_{k-1}), [x_1, \dots, \beta(x_i), \dots, x_{n-1}, y_k], \\ & \quad \alpha(y_{k+1}), \dots, \alpha(y_n)] \\ & = \sum_{k < j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ & \quad \alpha(y_{k+1}), \dots, \beta\alpha(y_j), \dots, \alpha(y_n)] \\ & + \varepsilon(X, Y_j) [\alpha(y_1), \dots, \alpha(y_{j-1}), \beta(\{x_1, \dots, x_i, \dots, x_{n-1}, y_j\}), \alpha(y_{j+1}), \dots, \alpha(y_n)] \\ & + \sum_{k > j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \beta\alpha(y_j), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ & \quad \alpha(y_{k+1}), \dots, \alpha(y_n)] \\ & = \sum_{k < j} \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ & \quad \alpha(y_{k+1}), \dots, \alpha(y_j), \dots, \alpha(y_n)\} \\ & + \varepsilon(X, Y_j) \{\alpha(y_1), \dots, \alpha(y_{j-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_j\}, \alpha(y_{j+1}), \dots, \alpha(y_n)\} \\ & + \sum_{k > j} \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_j), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ & \quad \alpha(y_{k+1}), \dots, \alpha(y_n)\}. \end{aligned}$$

This completes the proof. □

Corollary 3.13. Let $(L, [\cdot, \dots, \cdot], \varepsilon)$ be an n -Lie color algebra and $\alpha : L \rightarrow L$ a semi-morphism of L . Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon)$ is another n -Lie color algebra, with

$$\{x_1, \dots, x_n\} = [x_1, \dots, \alpha(x_i) \dots, x_n]$$

Definition 3.14. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra. An averaging operator of an n -Hom-Lie color algebra L is an even linear map $\beta : L \rightarrow L$ such that

$$(1) \quad \beta \alpha = \alpha \beta$$

$$(2) \quad \beta[x_1, \dots, \beta(x_i), \dots, x_n] = [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_n]$$

Theorem 3.15. Let $(L, [\cdot, \dots, \cdot], \varepsilon)$ be an n -Lie color algebra and $\alpha : L \rightarrow L$ an averaging operator of L . Define a new multiplication $\{\cdot, \dots, \cdot\} : L \times \dots \times L \rightarrow L$ by

$$\{x_1, \dots, x_n\} = [x_1, \dots, \alpha(x_i) \dots, x_n].$$

Then $L_\alpha = (L, \{\cdot, \dots, \cdot\}, \varepsilon, \alpha)$ is an n -Hom-Lie color algebra.

Proof. The proof can be obtained as follows:

$$\begin{aligned} \{\alpha(x_1), \dots, \alpha(x_{n-1}), \{y_1, \dots, y_n\}\} &= [\alpha(x_1), \dots, \alpha^2(x_i), \dots, \alpha(x_{n-1}), [y_1, \dots, \alpha(y_j), \dots, y_n]] \\ &= \sum_{k < j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_{k-1}), [x_1, \dots, \alpha(x_i), \dots, x_{n-1}, y_k], \\ &\quad \alpha(y_{k+1}), \dots, \alpha^2(y_j), \dots, \alpha(y_n)] \\ &\quad + \varepsilon(X, Y_j) [\alpha(y_1), \dots, \alpha(y_{j-1}), [x_1, \dots, \alpha(x_i), \dots, x_{n-1}, \alpha(y_j)], \\ &\quad \alpha(y_{j+1}), \dots, \alpha(y_n)] \\ &\quad + \sum_{k > j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha^2(y_j), \dots, \alpha(y_{k-1}), [x_1, \dots, \alpha(x_i), \dots, x_{n-1}, y_k], \\ &\quad \alpha(y_{k+1}), \dots, \alpha(y_n)] \\ &= \sum_{k < j} \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ &\quad \alpha(y_{k+1}), \dots, \alpha(y_j), \dots, \alpha(y_n)\} \\ &\quad + \varepsilon(X, Y_j) [\alpha(y_1), \dots, \alpha(y_{j-1}), \alpha(\{x_1, \dots, x_i, \dots, x_{n-1}, y_j\}), \alpha(y_{j+1}), \dots, \alpha(y_n)] \\ &\quad + \sum_{k > j} \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_j), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ &\quad \alpha(y_{k+1}), \dots, \alpha(y_n)] \\ &= \sum_{k < j} \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ &\quad \alpha(y_{k+1}), \dots, \alpha(y_j), \dots, \alpha(y_n)\} \\ &\quad + \varepsilon(X, Y_j) \{\alpha(y_1), \dots, \alpha(y_{j-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_j\}, \alpha(y_{j+1}), \dots, \alpha(y_n)\} \\ &\quad + \sum_{k > j} \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_j), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_{n-1}, y_k\}, \\ &\quad \alpha(y_{k+1}), \dots, \alpha(y_n)\}. \end{aligned}$$

This ends the proof. □

Theorem 3.16. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\beta : L \rightarrow L$ an averaging operator of L . Define a new multiplication $\{\cdot, \dots, \cdot\} : L \times \dots \times L \rightarrow L$ by*

$$\{x_1, \dots, x_n\} = [x_1, \dots, \beta(x_i) \dots, x_n]$$

Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon, \alpha)$ is also an n -Hom-Lie color algebra.

Proof. It is similar to the one of Theorem 3.12. □

Taking $\alpha = id$, yields the following statement.

Corollary 3.17. *Let $(L, [\cdot, \dots, \cdot], \varepsilon)$ be an n -Lie color algebra and $\alpha : L \rightarrow L$ an averaging operator of L . Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon)$ is another n -Lie color algebra, with*

$$\{x_1, \dots, x_n\} = [x_1, \dots, \alpha(x_i) \dots, x_n]$$

Taking $\alpha = \beta$, yields the following statement.

Corollary 3.18. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\alpha : L \rightarrow L$ an averaging operator. Define a new multiplication $\{\cdot, \dots, \cdot\} : L \times \dots \times L \rightarrow L$ by*

$$\{x_1, \dots, x_n\} = [x_1, \dots, \alpha(x_i) \dots, x_n]$$

Then $(L, \{\cdot, \dots, \cdot\}, \varepsilon, \alpha)$ is also an n -Hom-Lie color algebra.

Theorem 3.19. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\beta : L \rightarrow L$ an averaging operator of L . Then the new bracket $\{\cdot, \dots, \cdot\} : L \times \dots \times L \rightarrow L$ makes L into an n -Hom-Lie color algebra with*

$$\{x_1, \dots, x_n\} = [x_1, \dots, \beta(x_i) \dots, \beta(x_j), \dots, x_n].$$

Proof. The proof is obtained as follows:

$$\begin{aligned}
& \{\alpha(x_1), \dots, \alpha(x_{n-1}), \{y_1, \dots, y_n\}\} = \\
& = [\alpha(x_1), \dots, \beta\alpha(x_i), \dots, \beta\alpha(x_j), \dots, \alpha(x_{n-1}), [y_1, \dots, \beta(y_k), \dots, \beta(y_l), \dots, y_n]] \\
& = \sum_{m < k} \varepsilon(X, Y_m) [\alpha(y_1), \dots, \alpha(y_{m-1}), [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, y_m], \\
& \quad \alpha(y_{m+1}), \dots, \alpha\beta(y_k), \dots, \alpha\beta(y_l), \dots, \alpha(y_n)] \\
& \quad + \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_{k-1}), [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, \beta(y_k)], \\
& \quad \alpha(y_{k+1}), \dots, \alpha\beta(y_l), \dots, \alpha(y_n)] \\
& \quad + \sum_{k < m < l} \varepsilon(X, Y_m) [\alpha(y_1), \dots, \alpha\beta(y_k), \dots, \alpha(y_{l-1}), \\
& \quad [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, y_m], \alpha(y_{m+1}), \dots, \alpha\beta(y_l), \dots, \alpha(y_n)] \\
& \quad + \varepsilon(X, Y_l) [\alpha(y_1), \dots, \alpha\beta(y_k), \dots, \alpha(y_{l-1}), \\
& \quad [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, \beta(y_l)], \alpha(y_{l+1}), \dots, \alpha(y_n)] \\
& \quad + \sum_{m > l} \varepsilon(X, Y_m) [\alpha(y_1), \dots, \alpha\beta(y_k), \dots, \alpha\beta(y_l), \dots, \alpha(y_{m-1}), \\
& \quad [x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, y_m], \alpha(y_{m+1}), \dots, \alpha(y_n)] \\
& = \sum_{m < k} \varepsilon(X, Y_m) \{\alpha(y_1), \dots, \alpha(y_{m-1}), \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \\
& \quad \alpha(y_{m+1}), \dots, \alpha(y_k), \dots, \alpha(y_l), \dots, \alpha(y_n)\} \\
& \quad + \varepsilon(X, Y_k) [\alpha(y_1), \dots, \alpha(y_{k-1}), \beta([x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, y_k]), \\
& \quad \alpha(y_{k+1}), \dots, \beta\alpha(y_l), \dots, \alpha(y_n)] \\
& \quad + \sum_{k < m < l} \varepsilon(X, Y_m) \{\alpha(y_1), \dots, \alpha(y_k), \dots, \alpha(y_{m-1}), \\
& \quad \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \alpha(y_{m+1}), \dots, \alpha(y_l), \dots, \alpha(y_n)\} \\
& \quad + \varepsilon(X, Y_l) [\alpha(y_1), \dots, \beta\alpha(y_k), \dots, \alpha(y_{l-1}), \\
& \quad \beta([x_1, \dots, \beta(x_i), \dots, \beta(x_j), \dots, x_{n-1}, y_l]), \alpha(y_{l+1}), \dots, \alpha(y_n)] \\
& \quad + \sum_{m > l} \varepsilon(X, Y_m) \{\alpha(y_1), \dots, \alpha(y_k), \dots, \alpha(y_l), \dots, \alpha(y_{m-1}), \\
& \quad \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \alpha(y_{m+1}), \dots, \alpha(y_n)\} \\
& = \sum_{m < k} \varepsilon(X, Y_m) \{\alpha(y_1), \dots, \alpha(y_{m-1}), \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \\
& \quad \alpha(y_{m+1}), \dots, \alpha(y_k), \dots, \alpha(y_l), \dots, \alpha(y_n)\} \\
& \quad + \varepsilon(X, Y_k) \{\alpha(y_1), \dots, \alpha(y_{k-1}), \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_k\}, \\
& \quad \alpha(y_{k+1}), \dots, \alpha(y_l), \dots, \alpha(y_n)\} \\
& \quad + \sum_{k < m < l} \varepsilon(X, Y_m) \{\alpha(y_1), \dots, \alpha(y_k), \dots, \alpha(y_{m-1}),
\end{aligned}$$

$$\begin{aligned}
& \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \alpha(y_{m+1}), \dots, \alpha(y_l), \dots, \alpha(y_n)\} \\
& + \varepsilon(X, Y_l) \{ \alpha(y_1), \dots, \alpha(y_k), \dots, \alpha(y_{l-1}), \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_l\}, \\
& \quad \alpha(y_{l+1}), \dots, \alpha(y_n)\} \\
& + \sum_{m>l} \varepsilon(X, Y_m) \{ \alpha(y_1), \dots, \alpha(y_k), \dots, \alpha(y_l), \dots, \alpha(y_{m-1}), \\
& \quad \{x_1, \dots, x_i, \dots, x_j, \dots, x_{n-1}, y_m\}, \alpha(y_{m+1}), \dots, \alpha(y_n)\}.
\end{aligned}$$

This finishes the proof. \square

4 Hom-modules over n -Hom-Lie color algebras

In this section we consider Hom-modules over n -Hom-Lie color algebras.

Definition 4.1. Let G be an abelian group. A Hom-module is a pair (M, α_M) in which M is a G -graded linear space and $\alpha_M : M \rightarrow M$ is an even linear map.

Definition 4.2. Let $(L, [\dots], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and (M, α_M) a Hom-module. The Hom-module (M, α_M) is called an n -Hom-Lie module over L if there are n polylinear maps:

$$\omega_i : L \otimes \dots \otimes L \otimes \underbrace{M}_i \otimes L \otimes \dots \otimes L \rightarrow M, \quad i = 1, 2, \dots, n$$

such that, for any $x_i, y_i \in \mathcal{H}(L)$ and $m \in \mathcal{H}(M)$,

a) $\omega_i(x_1, \dots, x_{i-1}, m, x_{i+1}, \dots, x_n)$ is a ε -skew-symmetric by all x -type arguments.

b) $\omega_i(x_1, \dots, x_{i-1}, m, x_{i+1}, \dots, x_n) = -\varepsilon(m, x_{i+1}) \omega_i(x_1, \dots, x_{i-1}, x_{i+1}, m, \dots, x_n)$
for $i = 1, 2, \dots, n-1$.

c) $\omega_n(\alpha(x_1), \dots, \alpha(x_{n-1}), \omega_n(y_1, \dots, y_{n-1}, m)) =$
 $= \sum_{i=1}^{n-1} \varepsilon(X, Y_i) \omega_n(\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \dots, \alpha_M(m))$
 $+ \varepsilon(X, Y_n) \omega_n(\alpha(y_1), \dots, \alpha(y_{n-1}), \omega_n(x_1, \dots, x_{n-1}, m)),$

where $x_i, y_j \in \mathcal{H}(L)$, $X = \sum_{i=1}^{n-1} x_i$, $Y_i = \sum_{j=1}^i y_{j-1}$, $y_0 = e$ and $m \in \mathcal{H}(M)$.

d) $\omega_{n-1}(\alpha(x_1), \dots, \alpha(x_{n-2}), \alpha_M(m), [y_1, \dots, y_n]) =$
 $= \sum_{i=1}^n \varepsilon(X, Y_i) \omega_i(\alpha(y_1), \dots, \alpha(y_{i-1}), \omega_{n-1}(x_1, \dots, x_{n-2}, m, y_i),$
 $\quad \alpha(y_{i+1}), \dots, \alpha(y_n)],$

where $x_i, y_j \in \mathcal{H}(L)$, $X = \sum_{i=1}^{n-2} x_i + m$, $Y_i = \sum_{j=1}^i y_{j-1}$, $y_0 = e$ and $m \in \mathcal{H}(M)$.

Example 4.3. Any n -Hom-Lie color algebra $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is an n -Hom-Lie module over itself by taking $M = L$, $\alpha_M = \alpha$ and $\omega_i(\cdot, \dots, \cdot) = [\cdot, \dots, \cdot]$.

Theorem 4.4. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra, and let (M, α_M, ω_i) be an n -Hom-Lie color module and $\beta : L \rightarrow L$ be an endomorphism. Define

$$\tilde{\omega}_i = (\beta, \dots, \beta, \underbrace{id}_i, \beta, \dots, \beta), i = 1, 2, \dots, n.$$

Then $(M, \alpha_M, \tilde{\omega}_i)$ is an n -Hom-Lie color module.

Proof. The items $a)$ and $b)$ are obvious. So we only prove $c)$, item $d)$ being proved similarly.

$$\begin{aligned} & \tilde{\omega}_n(\alpha(x_1), \dots, \alpha(x_{n-1}), \tilde{\omega}_n(y_1, \dots, y_{n-1}, m)) = \\ & = \omega_n(\beta\alpha(x_1), \dots, \beta\alpha(x_{n-1}), \omega_n(\beta(y_1), \dots, \beta(y_{n-1}), m)) \\ & = \omega_n(\alpha\beta(x_1), \dots, \alpha\beta(x_{n-1}), \omega_n(\beta(y_1), \dots, \beta(y_{n-1}), m)) \\ & = \sum_{i=1}^{n-1} \varepsilon(X, Y_i) \omega_n(\alpha\beta(y_1), \dots, \alpha\beta(y_{i-1}), [\beta(x_1), \dots, \beta(x_{n-1}), \beta(y_i)], \\ & \quad \alpha\beta(y_{i+1}), \dots, \alpha_M(m)) \\ & \quad + \varepsilon(X, Y_n) \omega_n(\alpha\beta(y_1), \dots, \alpha\beta(y_{n-1}), \omega_n(\beta(x_1), \dots, \beta(x_{n-1}), m)) \\ & = \sum_{i=1}^{n-1} \varepsilon(X, Y_i) \omega_n(\beta\alpha(y_1), \dots, \beta\alpha(y_{i-1}), \beta([x_1, \dots, x_{n-1}, y_i]), \\ & \quad \beta\alpha(y_{i+1}), \dots, \alpha_M(m)) \\ & \quad + \varepsilon(X, Y_n) \omega_n(\beta\alpha(y_1), \dots, \beta\alpha(y_{n-1}), \omega_n(\beta(x_1), \dots, \beta(x_{n-1}), m)), \\ & = \sum_{i=1}^{n-1} \varepsilon(X, Y_i) \omega_n(\beta \otimes \dots \otimes \beta \otimes id)(\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \\ & \quad \alpha(y_{i+1}), \dots, \alpha_M(m)) \\ & \quad + \varepsilon(X, Y_n) \omega_n(\beta \otimes \dots \otimes \beta \otimes id) \left(id \otimes \dots \otimes id \otimes \omega_n(\beta \otimes \dots \otimes \beta \otimes id) \right) \\ & \quad (\alpha(y_1), \dots, \alpha(y_{n-1}), x_1, \dots, x_{n-1}, m) \\ & = \sum_{i=1}^{n-1} \varepsilon(X, Y_i) \tilde{\omega}_n(\alpha(y_1), \dots, \alpha(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha(y_{i+1}), \dots, \alpha_M(m)) \\ & \quad + \varepsilon(X, Y_n) \tilde{\omega}_n(\alpha(y_1), \dots, \alpha(y_{n-1}), \tilde{\omega}_n(x_1, \dots, x_{n-1}, m)). \end{aligned}$$

This ends the proof. \square

Corollary 4.5. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be an n -Hom-Lie color algebra and $\beta : L \rightarrow L$ be an endomorphism. Then $(L, \{\cdot, \dots, \cdot\}_i, \alpha)$, with

$$\{\cdot, \dots, \cdot\}_i = [\beta, \dots, \beta, \underbrace{id}_i, \beta, \dots, \beta], \quad i = 1, 2, \dots, n,$$

is an n -Hom-Lie color module.

Corollary 4.6. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. Then, for any $k \geq 1$, $(L, \{\cdot, \dots, \cdot\}_i^k, \alpha)$ is an n -Hom-Lie color module, with*

$$\{\cdot, \dots, \cdot\}_i^k = [\alpha^k, \dots, \alpha^k, \underbrace{id}_i, \alpha^k, \dots, \alpha^k], \quad i = 1, 2, \dots, n.$$

We end this section by giving some results for trivial gradation i.e. $G = \{e\}$.

Proposition 4.7. *Let (M, α_M, ω_i) be a module over the n -Hom-Lie algebra $(L, [\cdot, \dots, \cdot], \alpha_L)$. Consider the direct sum of linear spaces $A = L \oplus M$. Let' us define on A the bracket*

- $\{x_1, \dots, x_n\} = [x_1, \dots, x_n]$,
- $\{x_1, \dots, x_{i-1}, \dots, m, x_{i+1}, \dots, x_n\} = \omega_i(x_1, \dots, x_{i-1}, \dots, m, x_{i+1}, \dots, x_n)$,
- $\{x_1, \dots, x_i, \dots, x_j, \dots, x_n\} = 0$, whenever $x_i, x_j \in M$.

Then $(A, \alpha_A = \alpha_L + \alpha_M)$ is an n -Hom-Lie algebra.

Proposition 4.8. *Let $(M_1, \alpha_M^1, \omega_i^1)$ and $(M_2, \alpha_M^2, \omega_i^2)$ be two modules over the n -Hom-Lie algebra $(L, [\cdot, \dots, \cdot], \alpha)$. Then (M, α_M, ω_i) is an n -Hom-Lie module with*

$$M = M_1 \oplus M_2, \quad \alpha_M = \alpha_M^1 \oplus \alpha_M^2 \quad \text{and} \quad \omega_i = \omega_i^1 \oplus \omega_i^2.$$

5 Generalized derivation of color Hom-algebras and their color Hom-subalgebras

This section is devoted to generalized derivation of color Hom-algebras and their color Hom-subalgebras.

Here we give a more general definition of derivation, centroid and related objects.

Definition 5.1. *For any $k \geq 1$, we call $D \in \text{End}(L)$ an α^k -derivation of degree d of the multiplicative n -Hom-Lie color algebra $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ if*

$$\alpha \circ D = D \circ \alpha, \tag{5}$$

$$D([x_1, \dots, x_n]) = \tag{6}$$

$$\sum_{i=1}^n \varepsilon(d, X_i) [\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)].$$

Example 5.2 ([20]). *The Laplacian of any Hom-Lie quasi-bialgebra $(\mathcal{G}, \mu, \gamma, \phi, \alpha)$ is an α^2 -derivation of degree 0 of $(\Lambda\mathcal{G}, [\cdot, \cdot]^{\mu, \alpha})$, i.e.*

$$L([X, Y]^{\mu, \alpha}) = [L(X), \alpha^2(Y)]^{\mu, \alpha} + [\alpha^2(X), L(Y)]^{\mu, \alpha}, \quad \forall X, Y \in \Lambda\mathcal{G}. \tag{7}$$

Example 5.3. Now, Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. For any homogeneous elements x_1, \dots, x_{n-1} of L and any integer $k \geq 1$, one defines the adjoint action of ΛL on L by

$$ad_{x_1, \dots, x_{n-1}}^{[\cdot, \dots, \cdot], \alpha^k}([y_1, y_2, \dots, y_n]) := \sum_{i=1}^k \varepsilon(X, Y_i)[\alpha^k(y_1), \dots, \alpha^k(y_{i-1}), [x_1, \dots, x_{n-1}, y_i], \alpha^k(y_{i+1}), \dots, \alpha(y_n)],$$

for any $y_1, \dots, y_n \in \mathcal{H}(L)$. Then $ad_{x_1, \dots, x_{n-1}}^{[\cdot, \dots, \cdot], \alpha^k}$ is an α^k -derivation of L of degree X . We call $ad_{x_1, \dots, x_{n-1}}^{[\cdot, \dots, \cdot], \alpha^k}$ an inner α^k -derivation. Denote by $\text{Inn}(L) = \bigoplus_{k \geq -1} \text{Inn}_{\alpha^k}(L)$ the space of all inner α^k -derivation.

The following proposition is proved by a straightforward computation.

Proposition 5.4. Let D be an α^k -derivation of an n -Hom-Lie color algebra L and $\beta : L \rightarrow L$ an even endomorphism of L such that $D \circ \beta = \beta \circ D$. Then, for any non-negative integer s , $\Delta_s = D \circ \beta^s : L \rightarrow L$ is a $(\beta^s \alpha^k)$ -derivation.

Corollary 5.5. If D is an α^k -derivation of an n -Hom-Lie color algebra L . Then Δ_s is an α^{k+s} -derivation of L .

We denote the set of α^k -derivations of the multiplicative n -Hom-Lie color algebras L by $\text{Der}_{\alpha^k}(L)$. For any $D \in \text{Der}_{\alpha^k}(L)$ and $D' \in \text{Der}_{\alpha^k}(L)$, let us define their color commutator $[D, D']$ as usual by $[D, D'] = D \circ D' - \varepsilon(d, d')D' \circ D$.

Lemma 5.6. For any $D \in \text{Der}_{\alpha^k}(L)$ and $D' \in \text{Der}_{\alpha^k}(L)$,

$$[D, D'] \in \text{Der}_{\alpha^{k+s}}(L).$$

Denote by $\text{Der}(L) = \bigoplus_{k \geq -1} \text{Der}_{\alpha^k}(L)$.

Proposition 5.7. $(\text{Der}(L), [\cdot, \cdot], \omega)$ is a Hom-Lie color algebra, with $\omega(D) = D \circ \alpha$.

Definition 5.8. An endomorphism D of degree d of a multiplicative n -Hom-Lie color algebra $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is called a generalized α^k -derivation if there exist linear mappings $D', D'', \dots, D^{(n-1)}, D^{(n)}$ of degree d such that for any $x_1, \dots, x_n \in \mathcal{H}(L)$:

$$D \circ \alpha = \alpha \circ D \text{ and } D^{(i)} \circ \alpha = \alpha \circ D^{(i)}, \quad (8)$$

$$D^{(n)}([x_1, \dots, x_n]) = \sum_{i=1}^n \varepsilon(d, X_i)[\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D^{(i-1)}(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)]. \quad (9)$$

An $(n+1)$ -tuple $(D, D', D'', \dots, D^{(n-1)}, D^{(n)})$ is called an $(n+1)$ -ary α^k -derivation.

The set of generalized α^k -derivation is denoted by $GDer_{\alpha^k}$. Set

$$GDer(L) = \bigoplus_{k \geq -1} GDer_{\alpha^k}(L).$$

Definition 5.9. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. A linear mapping $D \in \text{End}(L)$ is said to be an α^k -quasiderivation of degree d if there exists a $D' \in \text{End}(L)$ of degree d such that

$$D'([x_1, \dots, x_n]) = \sum_{i=1}^n \varepsilon(d, X_i) [\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)] \quad (10)$$

for all $x_1, \dots, x_n \in \mathcal{H}(L)$

We call D' the endomorphism associated to the α^k -quasiderivation D . The set of α^k -quasiderivations will be denoted $QDer(L)$. Set $QDer(L) = \bigoplus_{k \geq -1} QDer_{\alpha^k}(L)$.

Definition 5.10. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. The set $C_{\alpha^k}(L)$ consisting of linear mapping D of degree d with the property

$$D([x_1, \dots, x_n]) = \varepsilon(d, X_i) [\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)] \quad (11)$$

for all $x_1, \dots, x_n \in \mathcal{H}(L)$, is called the α^k -centroid of L .

We recover the definition of the centroid when $k = 0$.

Definition 5.11. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. The set $QC_{\alpha^k}(L)$ consisting of linear mapping D of degree d with the property

$$[D(x_1), \dots, x_n] = \varepsilon(d, X_i) [\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)], \quad (12)$$

for all $x_1, \dots, x_n \in \mathcal{H}(L)$, is called the α^k -quasicentroid of L .

Definition 5.12. Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. The set $ZDer_{\alpha^k}(L)$ consisting of linear mappings D of degree d , such that for all $x_1, \dots, x_n \in \mathcal{H}(L)$:

$$D([x_1, \dots, x_n]) = \varepsilon(d, X_i) [\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)] = 0, \quad (13)$$

$$i = 1, 2, \dots, n,$$

is called the set of central α^k -derivations of L .

It is easy to see that

$$ZDer(L) \subseteq Der(L) \subseteq QDer(L) \subseteq GDer(L) \subseteq End(L).$$

Proposition 5.13. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra.*

1) $GDer(L), QDer(L), C(L)$ are color Hom-subalgebras of $(End(L), [\cdot, \cdot], \omega)$:

1a) $\omega(GDer(L)) \subseteq GDer(L)$ and $[GDer(L), GDer(L)] \subseteq GDer(L)$.

2b) $\omega(QDer(L)) \subseteq QDer(L)$ and $[QDer(L), QDer(L)] \subseteq QDer(L)$.

3c) $\omega(C(L)) \subseteq C(L)$ and $[C(L), C(L)] \subseteq C(L)$.

2) $ZDer(L)$ is a color Hom-ideal of $Der(L)$:

$$\omega(ZDer(L)) \subseteq ZDer(L) \text{ and } [ZDer(L), Der(L)] \subseteq ZDer(L).$$

Proof. 1a) Let us prove that if $D \in GDer(L)$, then $\omega(D) \in GDer(L)$.

For any $x_1, \dots, x_n \in \mathcal{H}(L)$,

$$\begin{aligned} (\omega(D^{(n)}))(x_1, \dots, x_n) &= (D^{(n)} \circ \alpha)(x_1, \dots, x_i, \dots, x_n) \\ &= D^{(n)}([\alpha(x_1), \dots, \alpha(x_i), \dots, \alpha(x_n)]) \\ &= \sum_{i=1}^n \varepsilon(d, X_i) [\alpha^{k+1}(x_1), \dots, \alpha^{k+1}(x_{i-1}), D^{(i-1)}\alpha(x_i), \alpha^{k+1}(x_{i+1}), \dots, \alpha^{k+1}(x_n)] \\ &= \sum_{i=1}^n \varepsilon(d, X_i) [\alpha^{k+1}(x_1), \dots, \alpha^{k+1}(x_{i-1}), (D^{(i-1)} \circ \alpha)(x_i), \\ &\hspace{15em} \alpha^{k+1}(x_{i+1}), \dots, \alpha^{k+1}(x_n)] \\ &= \sum_{i=1}^n \varepsilon(d, X_i) [\alpha^{k+1}(x_1), \dots, \alpha^{k+1}(x_{i-1}), \omega(D^{(i-1)})(x_i), \alpha^{k+1}(x_{i+1}), \dots, \alpha^{k+1}(x_n)]. \end{aligned}$$

This means that $\omega(D)$ is an α^{k+1} -derivation i.e. $\omega(D) \in GDer(L)$. Now let $D_1 \in GDer_{\alpha^k}(L)$ and $D_2 \in GDer_{\alpha^s}(L)$, we have

$$\begin{aligned} (D_2^{(n)} D_1^{(n)})(x_1, \dots, x_n) &= D_2^{(n)}(D_1^{(n)}(x_1, \dots, x_n)) = \\ &= \sum_{i=1}^n \varepsilon(d_1, X_i) D_2^{(n)}([\alpha^k(x_1), \dots, \alpha^k(x_{i-1}), D_1^{(i-1)}(x_i), \alpha^k(x_{i+1}), \dots, \alpha^k(x_n)]) \\ &= \sum_{i=1}^n \sum_{j < i} \varepsilon(d_1, X_i) \varepsilon(d_2, X_j) ([\alpha^{k+s}(x_1), \dots, D_2^{(j-1)}(x_j), \dots, \alpha^{k+s}(x_{i-1}), D_1^{(i-1)}\alpha^s(x_i), \\ &\hspace{15em} \alpha^{k+s}(x_{i+1}), \dots, \alpha^{k+s}(x_n)]) \\ &+ \sum_{i=1}^n \varepsilon(d_1 + d_2, X_i) ([\alpha^{k+s}(x_1), \dots, \alpha^{k+s}(x_{i-1}), D_2^{(i-1)} D_1^{(i-1)}(x_i), \end{aligned}$$

$$\begin{aligned}
& \alpha^{k+s}(x_{i+1}), \dots, \alpha^k(x_n)] \\
& + \sum_{i=1}^n \sum_{j>i}^n \varepsilon(d_1, X_i) \varepsilon(d_2, d_1 + X_j) ([\alpha^{k+s}(x_1), \dots, \alpha^{k+s}(x_{i-1}), D_1^{(i-1)} \alpha^s(x_i), \\
& \alpha^{k+s}(x_{i+1}), \dots, D_2^{(j-1)}(x_j), \dots, \alpha^{k+s}(x_n)]).
\end{aligned}$$

It follows that

$$\begin{aligned}
& ([D_1^{(n)}, D_2^{(n)}])([x_1, \dots, x_n]) = (D_1^{(n)} D_2^{(n)} - \varepsilon(d_1, d_2) D_2^{(n)} (D_1^{(n)}))([x_1, \dots, x_n]) = \\
& = \sum_{i=1}^n \varepsilon(d_1 + d_2, X_i) ([\alpha^{k+s}(x_1), \dots, \alpha^{k+s}(x_{i-1}), \\
& (D_1^{(i-1)} D_2^{(i-1)} - \varepsilon(d_1, d_2) D_2^{(i-1)} D_1^{(i-1)}](x_i), \alpha^{k+s}(x_{i+1}), \dots, \alpha^{k+s}(x_n)]) \\
& = \sum_{i=1}^n \varepsilon(d_1 + d_2, X_i) ([\alpha^{k+s}(x_1), \dots, \alpha^{k+s}(x_{i-1}), \\
& [D_1^{(i-1)}, D_2^{(i-1)}](x_i), \alpha^{k+s}(x_{i+1}), \dots, \alpha^{k+s}(x_n)]).
\end{aligned}$$

Thus we obtain that $[D_1, D_2] \in GDer_{\alpha^{k+s}}(L)$.

1b) That $QDer(L)$ is a color Hom-subalgebra of $(End(L), [\cdot, \cdot], \omega)$ is proved in the similar way.

1c) Let $D_1 \in C_{\alpha^k}(L)$ and $D_2 \in C_{\alpha^s}(L)$. Then

$$\begin{aligned}
& \omega(D_1)([x_1, x_2, \dots, x_n]) = \alpha D_1([x_1, x_2, \dots, x_n]) \\
& = \varepsilon(d_1, X_i) \alpha([\alpha^k(x_1), \alpha^k(x_2), \dots, D_1(x_i), \dots, \alpha^k(x_n)]) \\
& = \varepsilon(d_1, X_i) [\alpha^{k+1}(x_1), \alpha^{k+1}(x_2), \dots, D_1(x_i), \dots, \alpha^{k+1}(x_n)].
\end{aligned}$$

Thus $\omega(D) \in C_{\alpha^{k+1}}(L)$. Moreover,

$$\begin{aligned}
& [D_1, D_2]([x_1, \dots, x_n]) = D_1 D_2([x_1, \dots, x_n]) - \varepsilon(d_1, d_2) D_2 D_1([x_1, \dots, x_n]) \\
& = \varepsilon(d_2, X_i) D_1[\alpha^k(x_1), \alpha^k(x_2), \dots, D_2(x_i), \dots, \alpha^k(x_n)] \\
& \quad - \varepsilon(d_1, d_2) \varepsilon(d_1, X_i) D_2[\alpha^s(x_1), \alpha^s(x_2), \dots, D_1(x_i), \dots, \alpha^s(x_n)] \\
& = \varepsilon(d_1 + d_2, X_i) [\alpha^{k+s}(x_1), \alpha^{k+s}(x_2), \dots, D_1 D_2(x_i), \dots, \alpha^{k+s}(x_n)] \\
& \quad - \varepsilon(d_1 + d_2, X_i) [\alpha^{k+s}(x_1), \alpha^{k+s}(x_2), \varepsilon(d_1, d_2) \dots, D_2 D_1(x_i), \dots, \alpha^{k+s}(x_n)] \\
& = \varepsilon(d_1 + d_2, X_i) [\alpha^{k+s}(x_1), \alpha^{k+s}(x_2), \dots, [D_1 D_2](x_i), \dots, \alpha^{k+s}(x_n)].
\end{aligned}$$

So, $[D_1, D_2] \in C_{\alpha^{k+s}}(L)$ and finally $[D_1, D_2] \in C(L)$.

2) By the same method as previously one can show that $\omega(D) \in ZDer_{\alpha^{k+1}}(L)$ and $[D_1, D_2] \in ZDer_{\alpha^{k+s}}(L)$, where $D_1 \in ZDer_{\alpha^k}(L)$ and $D_2 \in Der_{\alpha^s}(L)$.

□

Proposition 5.14. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra.*

1) *If $\varphi \in C(L)$ and $D \in \text{Der}(L)$, then φD is a derivation i.e.*

$$C(L) \cdot \text{Der}(L) \subseteq \text{Der}(L).$$

2) *Any element of centroid is a quasiderivation i.e.*

$$C(L) \subseteq \text{QDer}(L).$$

Proof. 1) For any $x_1, \dots, x_n \in \mathcal{H}(L)$,

$$\begin{aligned} \varphi D([x_1, \dots, x_n]) &= \sum_{i=1}^n \varepsilon(d, X_i) \varphi([\alpha^k(x_1), \dots, D(x_i), \dots, \alpha^k(x_n)]) \\ &= \sum_{i=1}^n \varepsilon(d, X_i) \varepsilon(\varphi, X_i) [\alpha^{k+s}(x_1), \dots, \varphi D(x_i), \dots, \alpha^{k+s}(x_n)] \\ &= \sum_{i=1}^n \varepsilon(d + \varphi, X_i) [\alpha^{k+s}(x_1), \dots, \varphi D(x_i), \dots, \alpha^{k+s}(x_n)]. \end{aligned}$$

Thus φD is an α^{k+s} -derivation of degree $d + \varphi$.

2) Let D be an α^k -centroid, then for any $x_1, \dots, x_n \in \mathcal{H}(L)$,

$$D([x_1, \dots, x_n]) = \varepsilon(d, X_i) [\alpha^k(x_1), \dots, D(x_i), \dots, \alpha^k(x_n)], i = 1, 2, \dots, n. \quad (14)$$

It follows that

$$\sum_{i=1}^n \varepsilon(d, X_i) [\alpha^k(x_1), \dots, D(x_i), \dots, \alpha^k(x_n)] = nD([x_1, \dots, x_n]). \quad (15)$$

It suffices to take $D' = nD$. □

Lemma 5.15. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ be a multiplicative n -Hom-Lie color algebra. Then*

1) *The ε -commutator of two elements of quas centroid is a quasiderivation i.e.*

$$[\text{QC}(L), \text{QC}(L)] \subseteq \text{QDer}(L).$$

2) $\text{QDer}(L) + \text{QC}(L) \subseteq \text{GDer}(L)$.

Proof. For any $x_1, x_2, \dots, x_n \in \mathcal{H}(L)$,

1) let $D_1 \in QC_{\alpha^k}(L)$ and $D_2 \in QC_{\alpha^s}(L)$. We have, on the one hand

$$\begin{aligned}
& [D_1 D_2(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1, D_2 + X_i) [D_2(\alpha^k(x_1)), \alpha^{k+s}(x_2), \dots, D_1(\alpha^s(x_i)), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1, D_2 + X_i) \varepsilon(D_2, X_i) [\alpha^{k+s}(x_1), \dots, D_2 D_1(x_i), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1, D_2) \varepsilon(D_1 + D_2, X_i) [\alpha^{k+s}(x_1), \dots, D_2 D_1(x_i), \dots, \alpha^{k+s}(x_n)].
\end{aligned}$$

On the other hand,

$$\begin{aligned}
& [D_1 D_2(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_n)] = \\
&= \varepsilon(D_1, D_2 + x_1) [D_2(\alpha^k(x_1)), D_1(\alpha^s(x_2)), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1, D_2 + x_1) \varepsilon(D_2, D_1 + X_i) \\
&\quad [\alpha^{k+s}(x_1), D_1(\alpha^s(x_2)), \dots, D_2(\alpha^k(x_i)), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1, x_1) \varepsilon(D_2, X_i) \varepsilon(x_1, D_1) \\
& [D_1(\alpha^s(x_1)), \alpha^{k+s}(x_2), \dots, D_2(\alpha^k(x_i)), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_2, X_i) \varepsilon(D_1, X_i) [\alpha^{k+s}(x_1), \dots, D_1 D_2(x_i), \dots, \alpha^{k+s}(x_n)] \\
&= \varepsilon(D_1 + D_2, X_i) [\alpha^{k+s}(x_1), \dots, D_1 D_2(x_i), \dots, \alpha^{k+s}(x_n)],
\end{aligned}$$

and so

$$\begin{aligned}
& \varepsilon(D_1 + D_2, X_i) [\alpha^{k+s}(x_1), \dots, [D_1, D_2](x_i), \dots, \alpha^{k+s}(x_n)] = \\
&= \varepsilon(D_1 + D_2, X_i) \left([\alpha^{k+s}(x_1), \dots, D_1 D_2(x_i), \dots, \alpha^{k+s}(x_n)] \right. \\
&\quad \left. - \varepsilon(D_1, D_2) [\alpha^{k+s}(x_1), \dots, D_2 D_1(x_i), \dots, \alpha^{k+s}(x_n)] \right) = 0.
\end{aligned}$$

It follows that

$$\sum_{i=1}^n \varepsilon(D_1 + D_2, X_i) [\alpha^{k+s}(x_1), \dots, [D_1, D_2](x_i), \dots, \alpha^{k+s}(x_n)] = 0.$$

Therefore $D' \equiv 0$, and $[D_1, D_2] \in QDer(L)$.

2) Let $D_1 \in QDer_{\alpha^k}(L)$ and $D_2 \in QC_{\alpha^k}(L)$ with $|D_1| = |D_2|$.

Then there exists $D'_1 \in End(L)$ such that

$$\begin{aligned}
D'_1([x_1, \dots, x_n]) &= \sum_{i=1}^n \varepsilon(D_1, X_i) [\alpha^k(x_1), \dots, D_1(x_i), \dots, \alpha^k(x_n)] \\
&= [D_1(x_1), \alpha^k(x_2), \dots, \alpha^k(x_n)] + \varepsilon(D_1, x_1) [\alpha^k(x_1), D_1(x_2), \dots, \alpha^k(x_n)]
\end{aligned}$$

$$\begin{aligned}
& + \sum_{i=3}^n \varepsilon(D_1, X_i)[\alpha^k(x_1), \dots, D_1(x_i), \dots, \alpha^k(x_n)] \\
& = [(D_1 + D_2)(x_1), \alpha^k(x_2), \dots, \alpha^k(x_n)] - [D_2(x_1), \alpha^k(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \varepsilon(D_1, x_1)[\alpha^k(x_1), D_1(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \sum_{i=3}^n \varepsilon(D_1, X_i)[\alpha^k(x_1), \dots, D_1(x_i), \dots, \alpha^k(x_n)] \\
& = [(D_1 + D_2)(x_1), \alpha^k(x_2), \dots, \alpha^k(x_n)] - \varepsilon(D_2, x_1)[\alpha^k(x_1), D_2(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \varepsilon(D_1, x_1)[\alpha^k(x_1), D_1(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \sum_{i=3}^n \varepsilon(D_1, X_i)[\alpha^k(x_1), \dots, D_1(x_i), \dots, \alpha^k(x_n)] \\
& = [(D_1 + D_2)(x_1), \alpha^k(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \varepsilon(D_2, x_1)[\alpha^k(x_1), (D_1 - D_2)(x_2), \dots, \alpha^k(x_n)] \\
& \quad + \sum_{i=3}^n \varepsilon(D_1, X_i)[\alpha^k(x_1), \dots, D_1(x_i), \dots, \alpha^k(x_n)].
\end{aligned}$$

The conclusion follows by taking

$$D^{(n)} = D'_1, \quad D = D_1 + D_2, \quad D' = D_1 - D_2, \quad D^{(i)} = D_1, \quad 2 \leq i \leq n-1.$$

This proved that $D_1 + D_2 \in GDe(L)$. \square

Proposition 5.16. *If $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is a multiplicative n -Hom-Lie color algebra, then*

$$QC(L) + [QC(L), QC(L)]$$

is a color Hom-subalgebra of $GDer(L)$.

Proof. It follows from Lemma 5.15 by using the same arguments as in Proposition 2.4 in [44]. \square

Proposition 5.17. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is a multiplicative n -Hom-Lie color algebra such that α be a surjective mapping, then $[C(L), QC(L)] \subseteq Hom(L, Z(L))$. Moreover, if $Z(L) = \{0\}$, then $[C(L), QC(L)] = \{0\}$.*

Proof. Let $D_1 \in C_{\alpha^k}(L)$, $D_2 \in QC_{\alpha^s}(L)$ and $x_1, \dots, x_n \in \mathcal{H}(L)$. Since α is surjective, for

any $y'_i \in L$, there exists $y_i \in L$ such that $y'_i = \alpha^{k+s}(y_i), i = 2, \dots, n$. Thus

$$\begin{aligned}
& [[D_1, D_2](x_1), y'_2, \dots, y'_n] = \\
& = [[D_1, D_2](x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)] \\
& = [D_1 D_2(x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)] \\
& \quad - \varepsilon(d_1, d_2)[D_2 D_1(x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)] \\
& = D_1([D_2(x_1), \alpha^s(y_2), \dots, \alpha^s(y_n)]) \\
& \quad - \varepsilon(d_1, d_2)\varepsilon(d_2, x_1 + d_1)[D_1 \alpha^s(x_1), D_2 \alpha^k(y_2), \dots, \alpha^{k+s}(y_n)] \\
& = D_1([D_2(x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)]) \\
& \quad - \varepsilon(d_2, x_1)D_1[\alpha^s(x_1), \alpha^s D_2(y_2), \dots, \alpha^s(y_n)] \\
& = D_1 \left([D_2(x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)] \right. \\
& \quad \left. - \varepsilon(d_2, x_1)[\alpha^s(x_1), \alpha^s D_2(y_2), \dots, \alpha^s(y_n)] \right) \\
& = D_1 \left([D_2(x_1), \alpha^{k+s}(y_2), \dots, \alpha^{k+s}(y_n)] - [D_2(x_1), \alpha^s(y_2), \dots, \alpha^s(y_n)] \right) = 0.
\end{aligned}$$

Hence, $[D_1, D_2](x_1) \in Z(L)$, and $[D_1, D_2] \in \text{Hom}(L, Z(L))$. Furthermore, if $Z(L) = \{0\}$, we know that $[C(L), \mathcal{QC}(L)] = \{0\}$. \square

Proposition 5.18. *Let $(L, [\cdot, \dots, \cdot], \varepsilon, \alpha)$ is a multiplicative n -Hom-Lie color algebra with surjective twisting α and H be a graded subset of L . Then*

- i) $Z_L(H)$ is invariant under $C(L)$.
- ii) Every perfect color Hom-ideal of L is invariant under $C(L)$.

Proof. i) For any $\varphi \in C(L)$ and $x \in Z_L(H)$, by (4), we have

$$0 = \varphi([x, H, L, \dots, L]) = [\varphi(x), \alpha^k(H), \alpha^k(L), \dots, \alpha^k(L)] = [\varphi(x), H, L, \dots, L].$$

Therefore $\varphi(x) \in Z_L(H)$, which implies that $Z_L(H)$ is invariant under $C(L)$.

- ii) Let H be a perfect color Hom-ideal of L . Then $H^1 = H$, and so for any $x \in H$ there exist $x_1^i, x_2^i, \dots, x_n^i \in H$ with $0 < i < \infty$ such that $x = \sum_i [x_1^i, x_2^i, \dots, x_n^i]$. If $\varphi \in C(L)$, then

$$\begin{aligned}
\varphi(x) & = \varphi\left(\sum_i [x_1^i, x_2^i, \dots, x_n^i]\right) = \sum_i \varphi([x_1^i, x_2^i, \dots, x_n^i]) \\
& = \sum_i [\varphi(x_1^i), \alpha^k(x_2^i), \dots, \alpha^k(x_n^i)] \in H.
\end{aligned}$$

This shows that H is invariant under $C(L)$. \square

Proposition 5.19. *If the characteristic of \mathbb{K} is 0 or not a factor of $n - 1$. Then*

$$ZDer(L) = C(L) \cap Der(L).$$

Proof. If $\varphi \in C(L) \cap Der(L)$, then by (7) we have

$$\varphi([x_1, \dots, x_n]) = \sum_{i=1}^n \varepsilon(d, X_i)[\alpha^k(x_1), \dots, \varphi(x_i), \dots, \alpha^k(x_n)],$$

and by (14), for $i = 1, 2, \dots, n$,

$$\varepsilon(d, X_i)[\alpha^k(x_1), \dots, \varphi(x_i), \dots, \alpha^k(x_n)] = \varphi([x_1, \dots, x_n]).$$

Thus $\varphi([x_1, \dots, x_n]) = n\varphi([x_1, \dots, x_n])$. The characteristic of \mathbb{K} being 0 or not a factor of $n - 1$. We have

$$0 = \varphi([x_1, \dots, x_n]) = \varepsilon(d, X_i)[\alpha^k(x_1), \dots, \varphi(x_i), \dots, \alpha^k(x_n)], \quad i = 1, 2, \dots, n.$$

Which means that $\varphi \in ZDer(L)$.

Conversly, let $\varphi \in ZDer(L)$, Then

$$\varphi([x_1, \dots, x_n]) = \varepsilon(d, X_i)[\alpha^k(x_1), \dots, \varphi(x_i), \dots, \alpha^k(x_n)] = 0, \quad 1 \leq i \leq n$$

and thus $\varphi \in C(L) \cap Der(L)$. Therefore $ZDer(L) = C(L) \cap Der(L)$. □

Proposition 5.20. *Let L be an n -Hom-Lie color algebra. For any $D \in Der(L)$ and $\varphi \in C(L)$*

1) *$Der(L)$ is contained in the normalizer of $C(L)$ in $End(L)$ i.e.*

$$[Der(L), C(L)] \subseteq C(L).$$

2) *$QDer(L)$ is contained in the normalizer of $QC(L)$ in $End(L)$ i.e.*

$$[QDer(L), QC(L)] \subseteq QC(L).$$

Proof. 1) For any $D \in \text{Der}(L)$, $\varphi \in C(L)$ and $x_1, x_2, \dots, x_n \in \mathcal{H}(L)$,

$$\begin{aligned}
D\varphi([x_1, \dots, x_n]) &= D([\varphi(x_1), \alpha^k(x_2), \dots, \alpha^k(x_i), \dots, \alpha^k(x_n)]) \\
&= [D\varphi(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \\
&\quad + \sum_{i=2}^n \varepsilon(d, \varphi + X_i) [\alpha^s \varphi(x_1), \alpha^{k+s}(x_2), \dots, \alpha^k D(x_i), \dots, \alpha^{k+s}(x_n)] \\
&= [D\varphi(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \\
&\quad + \sum_{i=2}^n \varepsilon(d, \varphi + X_i) \varepsilon(\varphi, X_i) ([\alpha^{k+s}(x_1), \alpha^{k+s}(x_2), \dots, \varphi D(x_i), \dots, \alpha^{k+s}(x_n)]) \\
&= [D\varphi(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \\
&\quad + \varepsilon(d, \varphi) \sum_{i=2}^n \varepsilon(d + \varphi, X_i) ([\alpha^{k+s}(x_1), \alpha^{k+s}(x_2), \dots, \varphi D(x_i), \dots, \alpha^{k+s}(x_n)]) \\
&= [D\varphi(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \\
&\quad + \varepsilon(d, \varphi) \left(\varphi D[x_1, x_2, \dots, x_i, \dots, x_n] \right. \\
&\quad \left. - [\varphi D(x_1), \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)] \right).
\end{aligned}$$

Then we get

$$\begin{aligned}
(D\varphi - \varepsilon(d, \varphi)\varphi D)([x_1, \dots, x_n]) \\
&= [(D\varphi - \varepsilon(d, \varphi)\varphi D)(x_1), \dots, \alpha^{k+s}(x_2), \dots, \alpha^{k+s}(x_i), \dots, \alpha^{k+s}(x_n)],
\end{aligned}$$

that is $[D, \varphi] = D\varphi - \varepsilon(d, \varphi)\varphi D \in C(L)$.

2) It is proved by using a similar method. \square

Proposition 5.21. *Let L be an n -Hom-Lie color algebra. For any $D \in \text{Der}(L)$ and $\varphi \in C(L)$*

- 1) $D\varphi$ is contained in $C(L)$ if and only if φD is a central derivation of L .
- 2) $D\varphi$ is a derivation of L if and only if $[D, \varphi]$ is a central derivation of L .

Proof. 1) From Proposition 5.20, $D\varphi$ is an element of $C(L)$ if and only if $\varphi D \in \text{Der}(L) \cap C(L)$. Thanks to Proposition 5.19, we get the result.

2) The conclusion follows from 1), Proposition 5.19 and Proposition 5.20. \square

If A is a commutative associative algebra and L is an n -Hom-Lie color algebra, the n -Hom-Lie algebra $A \otimes L$ (Theorem 3.9) is called the tensor product n -Hom-Lie color algebra of A and L . For $f \in \text{End}(A)$ and $\varphi \in \text{End}(L)$ let $f \otimes \varphi : A \otimes L \rightarrow A \otimes L$ be given by $f \otimes \varphi(a \otimes x) = f(a) \otimes \varphi(x)$, for $a \in A, x \in L$. Then $f \otimes \varphi \in \text{End}(A \otimes L)$.

Recall that if A is a commutative associative algebra, the centroid $C(A)$ of A is by definition

$$C(A) = \{f \in \text{End}(A) \mid f(ab) = f(a)b = af(b), \forall a, b \in A\}.$$

We now state the following proposition.

Proposition 5.22. *With the above notation, we have*

$$C(A) \otimes C(L) \subseteq C(A \otimes L).$$

Proof. For any $a_i \in A, x_i \in \mathcal{H}(L), 1 \leq i \leq n$, and any $f \in C(A)$ and $\varphi \in C(L)$,

$$\begin{aligned} (f \otimes \varphi)[a_1 \otimes x_1, \dots, a_n \otimes x_n] &= (f \otimes \varphi)(a_1 \dots a_n) \otimes [x_1, \dots, x_n] \\ &= f(a_1 \dots a_n) \otimes \varphi[x_1, \dots, x_n] \\ &= \varepsilon(\varphi, X_i) a_1 \dots f(a_i) \dots a_n \otimes [\alpha^k(x_1), \dots, \varphi(x_i), \dots, \alpha^k(x_n)] \\ &= \varepsilon(\varphi, X_i) [a_1 \otimes \alpha^k(x_1) \dots f(a_i) \otimes \varphi(x_i), \dots, a_n \otimes \alpha^k(x_n)] \\ &= \varepsilon(\varphi, X_i) [\alpha^{lk}(a_1 \otimes x_1) \dots (f \otimes \varphi)(a_i \otimes x_i), \dots, \alpha^{lk}(a_n \otimes x_n)]. \end{aligned}$$

Therefore, $f \otimes \varphi \in C(A \otimes L)$. □

Aknowlegments

Dr. Ibrahima Bakayoko is grateful to the research environment in Mathematics and Applied Mathematics MAM, the Division of Applied Mathematics of the School of Education, Culture and Communication at Mälardalen University for hospitality and an excellent and inspiring environment for research and research education and cooperation in Mathematics during his visit, in the framework of expanding research and research education capacity and cooperation development in Africa and impact of the programs in Mathematics between Sweden and countries in Africa supported by Swedish International Development Agency (Sida) and International Program in Mathematical Sciences (IPMS).
