

DEGENERATE POLYEXPONENTIAL FUNCTIONS AND DEGENERATE BELL POLYNOMIALS

TAEKYUN KIM AND DAE SAN KIM

ABSTRACT. In recent years, studying degenerate versions of some special polynomials, which was initiated by Carlitz in an investigation of the degenerate Bernoulli and Euler polynomials, regained lively interest of many mathematicians. In this paper, as a degenerate version of polyexponential functions introduced by Hardy, we study degenerate polyexponential functions and derive various properties of them. Also, we introduce new type degenerate Bell polynomials, which are different from the previously studied partially degenerate Bell polynomials and arise naturally in the recent study of degenerate zero-truncated Poisson random variables, and deduce some of their properties. Furthermore, we derive some identities connecting the polyexponential functions and the new type degenerate Bell polynomials.

1. INTRODUCTION

It is well known that the Stirling numbers of the second kind are defined by

$$(1) \quad x^n = \sum_{l=0}^n S_2(n, l)(x)_l, \quad (n \geq 0), \quad (\text{see [4, 6, 8, 12, 22]}),$$

where $(x)_0 = 1$, $(x)_n = x(x-1)\cdots(x-n+1)$, $(n \geq 1)$.

From (1), we note that

$$(2) \quad \frac{1}{k!}(e^t - 1)^k = \sum_{n=k}^{\infty} S_2(n, k) \frac{t^n}{n!}, \quad (k \geq 0), \quad (\text{see [4, 5, 7, 16]}).$$

The Bell polynomials are given by the generating function

$$(3) \quad e^{x(e^t - 1)} = \sum_{l=0}^{\infty} \text{Bel}_l(x) \frac{t^l}{l!}, \quad (\text{see [4, 13]}).$$

When $x = 1$, $\text{Bel}_n = \text{Bel}_n(1)$ is called the n -th Bell number.

From (3), we note that

$$(4) \quad \text{Bel}_n(x) = \sum_{k=0}^n x^k S_2(n, k), \quad (n \geq 0), \quad (\text{see [4, 13]}).$$

For $k \in \mathbb{N} \cup \{0\}$, the polylogarithms are defined as

$$(5) \quad \text{Li}_k(x) = \sum_{n=1}^{\infty} \frac{x^n}{n^k}, \quad (\text{see [4, 12]}).$$

2010 *Mathematics Subject Classification.* 11B73; 11B83; 05A19.

Key words and phrases. degenerate polyexponential function; new type degenerate Bell polynomial; degenerate Lerch zeta function; degenerate Hurwitz zeta function; degenerate Riemann zeta function.

Note that $\text{Li}_1(x) = -\log(1-x)$.

The polyexponential function was first considered by Hardy and is given by

$$(6) \quad e(x, a|s) = \sum_{n=0}^{\infty} \frac{x^n}{(n+a)^s n!}, \quad (\text{Re}(a) > 0), \quad (\text{see [9, 10, 11]}).$$

From (6), we note that

$$(7) \quad e(x, 1|1) = \sum_{n=0}^{\infty} \frac{x^n}{(n+1)!} = \frac{1}{x} \left(\sum_{n=0}^{\infty} \frac{x^n}{n!} - 1 \right) = \frac{1}{x} (e^x - 1), \quad (\text{see [2, 9, 10, 11]}).$$

For any nonzero $\lambda \in \mathbb{R}$, the degenerate exponential function is defined by

$$(8) \quad e_{\lambda}^x(t) = (1 + \lambda t)^{\frac{t}{\lambda}}, \quad e_{\lambda}(t) = e_{\lambda}^1(t), \quad (\text{see [14, 15, 19]}).$$

Note that $\lim_{\lambda \rightarrow 0} e_{\lambda}^x(t) = e^{xt}$.

In [3], Carlitz considered the degenerate Bernoulli polynomials which are given by

$$(9) \quad \frac{t}{e_{\lambda}(t) - 1} e_{\lambda}^x(t) = \sum_{n=0}^{\infty} \beta_{n,\lambda}(x) \frac{t^n}{n!}.$$

When $x = 0$, $\beta_{n,\lambda} = \beta_{n,\lambda}(0)$ is called the n -th degenerate Bernoulli number. Note that $\lim_{\lambda \rightarrow 0} \beta_{n,\lambda}(x) = B_n(x)$, where $B_n(x)$ are the ordinary Bernoulli polynomials given by

$$\frac{t}{e^t - 1} e^{xt} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}, \quad (\text{see [12 - 22]}).$$

Recently, Kim introduced the degenerate Stirling numbers of the second kind which are defined by

$$(10) \quad (x)_{n,\lambda} = \sum_{k=0}^n S_{2,\lambda}(n,k) (x)_k, \quad (n \geq 0), \quad (\text{see [16]}),$$

where $(x)_{0,\lambda} = 1$, $(x)_{b,\lambda} = x(x-\lambda)(x-2\lambda)\cdots(x-(n-1)\lambda)$, $(n \geq 1)$.

In [13], the partially degenerate Bell polynomials are defined as

$$(11) \quad e^{x(e_{\lambda}(t)-1)} = \sum_{n=0}^{\infty} \text{bel}_{n,\lambda}(x) \frac{t^n}{n!}.$$

From (10) and (11), we note that

$$(12) \quad \text{bel}_{n,\lambda}(x) = \sum_{k=0}^n x^k S_{2,\lambda}(n,k), \quad (\text{see [13, 20]}).$$

It is easy to show that $\lim_{\lambda \rightarrow 0} \text{bel}_{n,\lambda}(x) = \text{Bel}_n(x)$, $(n \geq 0)$.

By (11), we easily get

$$(13) \quad \text{bel}_{n,\lambda}(x) = e^{-x} \sum_{k=0}^{\infty} \frac{(k)_{n,\lambda}}{k!} x^k, \quad (n \geq 0).$$

In this paper, as a degenerate version of polyexponential functions introduced by Hardy, we study degenerate polyexponential functions and derive various properties of them. Also, we introduce new type degenerate Bell polynomials, which are different from the previously studied partially degenerate Bell polynomials and arise naturally in the recent study of degenerate zero-truncated Poisson random variables, and deduce some of their properties. Furthermore, we derive some identities connecting the polyexponential functions and the new type degenerate Bell polynomials.

This paper is organized as follows. In Section 1, we recall some necessary ingredients, namely polyexponential functions, degenerate Bernoulli polynomials, degenerate Stirling numbers of the

second kind and partially degenerate Bell polynomials. In Section 2, we introduce the degenerate polyexponential functions and derive several properties of them. Especially, we find integral representations for the degenerate polyexponential functions. Then we introduce the new type degenerate Bell polynomials, deduce some of their properties and get their connections with degenerate polyexponential functions. Finally, in Section 3, we recall the degenerate Lerch zeta functions which are closely related to the degenerate polyexponential functions. Also, we note the degenerate Hurwitz zeta functions and the degenerate Riemann zeta functions, as special cases of the degenerate Lerch zeta functions.

2. DEGENERATE POLYEXPONENTIAL FUNCTIONS AND DEGENERATE BELL POLYNOMIALS

In view of (8), we consider the degenerate polyexponential functions which are given by

$$(14) \quad e_\lambda(x, \delta|k) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!(n+\delta)^k} x^n,$$

where $k \in \mathbb{N} \cup \{0\}$, and $\delta \in \mathbb{C}$ with $\operatorname{Re}(\delta) > 0$.

By (14), we easily get

$$(15) \quad e_\lambda(x, \delta|0) = e_\lambda(x), \quad e_\lambda(x, 1|1) = \frac{1}{x} \frac{1}{1+\lambda} (e_\lambda(x) - 1) + \frac{\lambda}{1+\lambda} e_\lambda(x).$$

Note that

$$\lim_{\lambda \rightarrow 0} e_\lambda(x, 1|1) = \frac{1}{x} (e^x - 1) = e(x, 1|1).$$

It is known that the degenerate gamma function is defined by

$$(16) \quad \Gamma_\lambda(s) = \int_0^\infty t^{s-1} e_\lambda^{-1}(t) dt, \quad (\operatorname{Re}(s) > 0), \quad (\text{see [15, 19]}).$$

From (16), we consider the incomplete degenerate gamma function given by

$$(17) \quad d_\lambda(\delta, x) = \int_0^x t^{\delta-1} e_\lambda(-t) dt = x^\delta e_\lambda(-x, \delta|1),$$

where $\operatorname{Re}(\delta) > 0$ and $x \geq 0$. Note that $\lim_{x \rightarrow \infty} d_\lambda(\delta, x) = \Gamma_{-\lambda}(\delta)$.

Theorem 1. For $\delta \in \mathbb{C}$ with $\operatorname{Re}(\delta) > 0$, and $x \geq 0$, we have

$$x^\delta e_\lambda(-x, \delta|1) = d_\lambda(\delta, x).$$

From (17), we note that

$$(18) \quad \frac{d}{dx} [x^\delta e_\lambda(-x, \delta|1)] = x^{\delta-1} e_\lambda(-x).$$

In particular,

$$e_\lambda(x, 1|2) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!(n+1)^2} x^n,$$

and

$$\begin{aligned}
(19) \quad \frac{1}{x} \int_0^x \frac{1}{t} (e_\lambda(t) - 1) dt &= \frac{1}{x} \int_0^x \frac{1}{t} \left(\sum_{n=1}^{\infty} \frac{(1)_{n,\lambda}}{n!} t^n \right) dt = \frac{1}{x} \sum_{n=0}^{\infty} \frac{(1)_{n+1,\lambda}}{(n+1)!} \int_0^x t^n dt \\
&= \frac{1}{x} \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n+1)!(n+1)} (1-n\lambda) x^{n+1} \\
&= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!(n+1)^2} x^n - \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}(n+1-1)\lambda}{n!(n+1)^2} x^n \\
&= e_\lambda(x, 1|2) - \lambda (e_\lambda(x, 1|1) - e_\lambda(x, 1|2)) \\
&= (1+\lambda)e_\lambda(x, 1|2) - \lambda e_\lambda(x, 1|1).
\end{aligned}$$

By (15) and (19), we get

$$\begin{aligned}
(20) \quad e_\lambda(x, 1|2) &= \frac{1}{1+\lambda} \cdot \frac{1}{x} \int_0^x \frac{1}{t} (e_\lambda(t) - 1) dt + \frac{\lambda}{1+\lambda} e_\lambda(x, 1|1) \\
&= \frac{1}{1+\lambda} \cdot \frac{1}{x} \int_0^x \frac{1}{t} (e_\lambda(t) - 1) dt + \frac{1}{x} \frac{\lambda}{(1+\lambda)^2} (e_\lambda(x) - 1) + \left(\frac{\lambda}{1+\lambda} \right)^2 e_\lambda(x).
\end{aligned}$$

Lemma 2. For all x , we have

$$e_\lambda(x, 1|2) = \frac{1}{1+\lambda} \cdot \frac{1}{x} \int_0^x \frac{1}{t} (e_\lambda(t) - 1) dt + \frac{1}{x} \frac{\lambda}{(1+\lambda)^2} (e_\lambda(x) - 1) + \left(\frac{\lambda}{1+\lambda} \right)^2 e_\lambda(x).$$

Let $\text{Ein}_\lambda(z)$ be the special degenerate entire function which is defined by

$$\begin{aligned}
(21) \quad \text{Ein}_\lambda(x) &= \int_0^x \frac{1}{t} (1 - e_\lambda(-t)) dt = \int_0^x \frac{1}{t} \left(1 - \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda}}{k!} (-1)^k t^k \right) dt \\
&= \int_0^x \frac{1}{t} \sum_{k=1}^{\infty} (-1)^{k-1} \frac{(1)_{k,\lambda}}{k!} t^k dt = \sum_{k=1}^{\infty} \frac{(1)_{k,\lambda}}{k!} (-1)^{k-1} \int_0^x t^{k-1} dt \\
&= \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k! \cdot k} (1)_{k,\lambda} x^k.
\end{aligned}$$

On the other hand,

$$\begin{aligned}
(22) \quad e_\lambda(x, 1|2) &= \frac{1}{1+\lambda} \frac{1}{x} \int_0^x \frac{1}{t} (e_\lambda(t) - 1) dt + \frac{1}{x} \frac{\lambda}{(1+\lambda)^2} (e_\lambda(x) - 1) + \left(\frac{\lambda}{1+\lambda} \right)^2 e_\lambda(x) \\
&= -\frac{1}{1+\lambda} \frac{1}{x} \int_0^{-x} \frac{1}{t} (1 - e_\lambda(-t)) dt + \frac{1}{x} \frac{\lambda}{(1+\lambda)^2} (e_\lambda(x) - 1) + \left(\frac{\lambda}{1+\lambda} \right)^2 e_\lambda(x) \\
&= -\frac{1}{1+\lambda} \frac{1}{x} \text{Ein}_\lambda(-x) + \frac{1}{x} \frac{\lambda}{(1+\lambda)^2} (e_\lambda(x) - 1) + \left(\frac{\lambda}{1+\lambda} \right)^2 e_\lambda(x).
\end{aligned}$$

Thus, we have

$$(23) \quad x(1+\lambda)e_\lambda(-x, 1|2) = \text{Ein}_\lambda(x) - \frac{\lambda}{1+\lambda} (e_\lambda(-x) - 1) + x \frac{\lambda^2}{1+\lambda} e_\lambda(-x).$$

From (23), we note that

$$\text{Ein}_\lambda(x) = x(1+\lambda)e_\lambda(-x, 1|2) + \frac{\lambda}{1+\lambda} (e_\lambda(-x) - 1) - x \frac{\lambda^2}{1+\lambda} e_\lambda(-x).$$

It is easy to show that

$$\left(\frac{d}{dx}x\right)e_\lambda(x, 1|p+1) = \frac{d}{dx}x \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}x^n}{n!(n+1)^{p+1}} = e_\lambda(x, 1|p).$$

Thus, we have

$$e_\lambda(x, 1|p+1) = \frac{1}{x} \int_0^x e_\lambda(t, 1|p) dt.$$

In general,

$$\left(\frac{d}{dx}x\right)[x^{\delta-1}e_\lambda(x, \delta|p+1)] = \frac{d}{dx} \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}x^{n+\delta}}{n!(n+\delta)^{p+1}} = x^{\delta-1}e_\lambda(x, \delta|p).$$

Thus, we have

$$e_\lambda(x, \delta|p+1) = \frac{1}{x^\delta} \int_0^x t^{\delta-1}e_\lambda(x, \delta|p) dt.$$

For $p \in \mathbb{N}$, we have

$$\begin{aligned} (24) \quad \left(\frac{d}{dx}x\right)^p [x^{\delta-1}e_\lambda(x, \delta|p)] &= \underbrace{\left(\frac{d}{dx}x\right) \times \left(\frac{d}{dx}x\right) \times \cdots \times \left(\frac{d}{dx}x\right)}_{p\text{-times}} [x^{\delta-1}e_\lambda(x, \delta|p)] \\ &= \left(\frac{d}{dx}x\right)^{p-1} [x^{\delta-1}e_\lambda(x, \delta|p-1)] \\ &= \cdots \\ &= x^{\delta-1} \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n = x^{\delta-1}e_\lambda(x). \end{aligned}$$

Let $|z| < |\delta|$. Then we note that

$$\begin{aligned} (25) \quad \sum_{p=0}^{\infty} e_\lambda(x, \delta|p)z^p &= \sum_{p=0}^{\infty} \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}x^n}{n!(n+\delta)^p} z^p = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n \sum_{p=0}^{\infty} \left(\frac{z}{n+\delta}\right)^p \\ &= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n \frac{n+\delta}{n+\delta-z} = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n \left(1 + \frac{z}{n+\delta-z}\right) \\ &= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n + z \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!(n+\delta-z)} x^n \\ &= e_\lambda(x) + ze_\lambda(x, \delta-z|1). \end{aligned}$$

Therefore, we obtain the following theorem.

Theorem 3. For $p \in \mathbb{N}$ and $|z| < |\delta|$, we have

$$\left(\frac{d}{dx}x\right)^p [x^{\delta-1}e_\lambda(x, \delta|p)] = x^{\delta-1}e_\lambda(x),$$

and

$$\sum_{k=0}^{\infty} e_\lambda(x, \delta|k)z^k = e_\lambda(x) + ze_\lambda(x, \delta-z|1).$$

Now, we observe that

$$\begin{aligned} (26) \quad \left(\frac{d}{dz}\right)^m (e_\lambda(x, \delta-z|1)) &= \left(\frac{d}{dz}\right)^m \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}x^n}{n!(n+\delta-z)} = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}x^n m!}{n!(n+\delta-z)^{m+1}} \\ &= m!e_\lambda(x, \delta-z|m+1). \end{aligned}$$

By using the Taylor expansion of $e_\lambda(x, \delta - z|1)$ with respect to z , we get

$$(27) \quad e_\lambda(x, \delta - z|1) = \sum_{m=0}^{\infty} \left(\frac{d}{dz} \right)^m (e_\lambda(x, \delta - z|1)) \Big|_{z=0} \cdot \frac{z^m}{m!} = \sum_{m=0}^{\infty} e_\lambda(x, \delta|m+1) z^m.$$

Moreover,

$$(28) \quad \begin{aligned} \left(\frac{d}{dz} \right)^m (e_\lambda(x, \delta - z|s)) &= \left(\frac{d}{dz} \right)^m \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda} x^n}{n!(n+\delta-z)^s} \\ &= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda} x^n}{n!} \cdot \frac{s(s+1) \cdots (s+m-1)}{(n+\delta-z)^{m+s}} \\ &= \frac{\Gamma(s+m)}{\Gamma(s)} e_\lambda(x, \delta - z|m+s). \end{aligned}$$

By using Taylor expansion of $e_\lambda(x, \delta - z|s)$ with respect to z , we get

$$(29) \quad e_\lambda(x, \delta - z|s) = \sum_{m=0}^{\infty} \frac{\left(\frac{d}{dz} \right)^m (e_\lambda(x, \delta - z|s)) \Big|_{z=0}}{m!} z^m = \sum_{m=0}^{\infty} \frac{\Gamma(s+m)}{\Gamma(s)m!} e_\lambda(x, \delta|m+s) z^m.$$

Therefore, from (29), we obtain the following theorem.

Theorem 4. For $\delta, s \in \mathbb{C}$ with $\operatorname{Re}(\delta) > 0$, $\operatorname{Re}(s) > 0$, we have

$$e_\lambda(x, \delta - z|s) = \sum_{m=0}^{\infty} \frac{\Gamma(s+m)}{\Gamma(s)m!} e_\lambda(x, \delta|m+s) z^m.$$

In addition, for $s = k \in \mathbb{N}$, we have

$$e_\lambda(x, \delta - z|k) = \sum_{m=0}^{\infty} \binom{k+m-1}{k-1} e_\lambda(x, \delta|m+k) z^m.$$

As is traditional, let $\int_{\infty}^{(0+)}$ (respectively, $\int_{-\infty}^{(0+)}$) denote the integration of path that starts at infinity (respectively, at negative infinity), encircles the origin counter-clockwise direction and returns to the starting point. Then we have the following well-known integral representation of $-2i \sin \pi s \Gamma(s)$ as an entire function of s (see [21]):

$$(30) \quad \int_{\infty}^{(0+)} (-t)^{s-1} e^{-t} dt = -2i \sin \pi s \int_0^{\infty} t^{s-1} e^{-t} dt = -2i \sin \pi s \Gamma(s) = -2\pi i \frac{1}{\Gamma(1-s)}.$$

By (30), we get

$$(31) \quad \frac{1}{\Gamma(1-s)} = -\frac{1}{2\pi i} \int_{\infty}^{(0+)} (-t)^{s-1} e^{-t} dt = \frac{1}{2\pi i} \int_{-\infty}^{(0+)} t^{s-1} e^t dt.$$

From (31), we easily note that

$$\begin{aligned} \frac{\Gamma(1-s)}{2\pi i} \int_{-\infty}^{(0+)} t^{s-1} e^{\delta t} e^{nt} dt &= \frac{\Gamma(1-s)}{2\pi i} \frac{1}{(n+\delta)^s} \int_{-\infty}^{(0+)} e^t t^{s-1} dt \\ &= \frac{\Gamma(1-s)}{2\pi i} \frac{1}{(n+\delta)^s} \frac{2\pi i}{\Gamma(1-s)} = \frac{1}{(n+\delta)^s}. \end{aligned}$$

Thus, by (14) and (32), we get

$$\begin{aligned}
 (32) \quad e_\lambda(x, \delta|s) &= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} \frac{x^n}{(n+\delta)^s} = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} x^n \frac{\Gamma(1-s)}{2\pi i} \int_{-\infty}^{(0+)} t^{s-1} e^{\delta t} e^{nt} dt \\
 &= \frac{\Gamma(1-s)}{2\pi i} \int_{-\infty}^{(0+)} e^{\delta t} t^{s-1} \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!} e^{nt} x^n dt \\
 &= \frac{\Gamma(1-s)}{2\pi i} \int_{-\infty}^{(0+)} e^{\delta t} t^{s-1} e_\lambda(xe^t) dt.
 \end{aligned}$$

For $m \in \mathbb{N}$, we have

$$\begin{aligned}
 (33) \quad e_\lambda(x, \delta|m) &= \lim_{s \rightarrow m} e_\lambda(x, \delta|s) = \lim_{s \rightarrow m} \frac{1}{2\pi i} \frac{\pi}{\Gamma(s) \sin \pi s} \int_{-\infty}^{(0+)} e^{\delta t} t^{s-1} e_\lambda(xe^t) dt \\
 &= \frac{1}{2\pi i} \frac{(-1)^m}{\Gamma(m)} \int_{-\infty}^{(0+)} e^{\delta t} t^{m-1} e_\lambda(xe^t) \text{Log } t dt \\
 &= \frac{1}{2\pi i} \frac{(-1)^m}{(m-1)!} \int_{-\infty}^{(0+)} e^{\delta t} t^{m-1} e_\lambda(xe^t) \text{Log } t dt.
 \end{aligned}$$

Therefore, by (32) and (33), we obtain the following theorem.

Theorem 5. For $s, \delta \in \mathbb{C}$ with $\text{Re}(\delta) > 0$, $s \in \mathbb{C} \setminus \mathbb{N}$, and $x \in \mathbb{C}$, we have the integral representation

$$e_\lambda(x, \delta|s) = \frac{\Gamma(1-s)}{2\pi i} \int_{-\infty}^{(0+)} t^{s-1} e^{\delta t} e_\lambda(xe^t) dt.$$

In addition, for $s = m \in \mathbb{N}$, we have the integral representation

$$e_\lambda(x, \delta|m) = \frac{(-1)^m}{2\pi i (m-1)!} \int_{-\infty}^{(0+)} t^{m-1} e^{\delta t} e_\lambda(xe^t) \text{Log } t dt.$$

Now, we consider new type degenerate Bell polynomials which are given by

$$(34) \quad e_\lambda(xe^t) \cdot e_\lambda^{-1}(x) = \sum_{n=0}^{\infty} \text{Bel}_{n,\lambda}(x) \frac{t^n}{n!}.$$

From (3) and (34), we note that $\lim_{\lambda \rightarrow 0} \text{Bel}_{n,\lambda}(x) = \text{Bel}_n(x)$, ($n \geq 0$).

Now, we observe that

$$(35) \quad \left(x \frac{d}{dx}\right)^n e_\lambda(x) = \left(x \frac{d}{dx}\right)^n \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda}}{k!} x^k = \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda}}{k!} k^n x^k.$$

On the other hand,

$$(36) \quad \sum_{n=0}^{\infty} \text{Bel}_{n,\lambda}(x) \frac{t^n}{n!} = e_\lambda^{-1}(x) e_\lambda(xe^t) = \sum_{n=0}^{\infty} \left(e_\lambda^{-1}(x) \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda}}{k!} k^n x^k \right) \frac{t^n}{n!}.$$

When $x = 1$, $\text{Bel}_{n,\lambda} = \text{Bel}_{n,\lambda}(1)$ are called the new type degenerate Bell numbers. Therefore, by (35) and (36), we obtain the following theorem.

Theorem 6 (Dobinski's formula). For $n \geq 0$, we have

$$\text{Bel}_{n,\lambda}(x) = e_\lambda^{-1}(x) \left(x \frac{d}{dx}\right)^n e_\lambda(x) = e_\lambda^{-1}(x) \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda}}{k!} k^n x^k.$$

From (13), we note that

$$\begin{aligned}
(37) \quad e_\lambda(x, \delta|s) &= \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda} x^k}{k!(k+\delta)^s} = \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda} x^k}{k!} \frac{1}{\delta^s} \left(1 + \frac{k}{\delta}\right)^{-s} \\
&= \sum_{k=0}^{\infty} \frac{(1)_{k,\lambda} x^k}{k!} \delta^{-s} \sum_{n=0}^{\infty} \binom{-s}{n} \left(\frac{k}{\delta}\right)^n \\
&= e_\lambda(x) \sum_{n=0}^{\infty} \binom{-s}{n} \frac{1}{\delta^{s+n}} e_\lambda^{-1}(x) \sum_{k=0}^{\infty} \frac{k^n}{k!} (1)_{k,\lambda} x^k \\
&= e_\lambda(x) \sum_{n=0}^{\infty} \binom{-s}{n} \frac{1}{\delta^{s+n}} \text{Bel}_{n,\lambda}(x).
\end{aligned}$$

Therefore, by (37), we obtain the following corollary.

Corollary 7. For $n \geq 0$ and $\text{Re}(s) > 0$, $\text{Re}(\delta) > 0$, we have

$$e_\lambda(x, \delta|s) = e_\lambda(x) \sum_{n=0}^{\infty} \binom{-s}{n} \frac{1}{\delta^{s+n}} \text{Bel}_{n,\lambda}(x).$$

From (34), we note that

$$(38) \quad \frac{d}{dt} (e_\lambda(xe^t) e_\lambda^{-1}(x)) = xe^t e_\lambda(xe^t) e_\lambda^{-1}(x) \cdot (1 + \lambda xe^t)^{-1}.$$

Thus we have

$$\begin{aligned}
(39) \quad (1 + \lambda xe^t) \frac{d}{dt} (e_\lambda(xe^t) e_\lambda^{-1}(x)) &= xe^t e_\lambda(xe^t) e_\lambda^{-1}(x) = xe^t \sum_{l=0}^{\infty} \text{Bel}_{l,\lambda}(x) \frac{t^l}{l!} \\
&= x \sum_{m=0}^{\infty} \frac{t^m}{m!} \sum_{l=0}^{\infty} \text{Bel}_{l,\lambda}(x) \frac{t^l}{l!} = x \sum_{n=0}^{\infty} \left(\sum_{l=0}^n \binom{n}{l} \text{Bel}_{l,\lambda}(x) \right) \frac{t^n}{n!}.
\end{aligned}$$

On the other hand,

$$\begin{aligned}
(40) \quad (1 + \lambda xe^t) \frac{d}{dt} (e_\lambda(xe^t) e_\lambda^{-1}(x)) &= (1 + \lambda xe^t) \sum_{n=1}^{\infty} \text{Bel}_{n,\lambda}(x) \frac{t^{n-1}}{(n-1)!} \\
&= \sum_{n=0}^{\infty} \text{Bel}_{n+1,\lambda}(x) \frac{t^n}{n!} + \lambda x \sum_{n=0}^{\infty} \left(\sum_{l=0}^n \binom{n}{l} \text{Bel}_{l+1,\lambda}(x) \right) \frac{t^n}{n!}.
\end{aligned}$$

Therefore, by comparing the coefficients on both sides of (39) and (40), we obtain the following theorem.

Theorem 8. For $n \geq 0$, we have

$$\text{Bel}_{n+1,\lambda}(x) = x \sum_{l=0}^n \binom{n}{l} (\text{Bel}_{l,\lambda}(x) - \lambda \text{Bel}_{l+1,\lambda}(x)).$$

We observe that

$$(41) \quad \frac{d}{dx} (e_\lambda(xe^t) \cdot e_\lambda^{-1}(x)) = e^t e_\lambda(xe^t) e_\lambda^{-1}(x) (1 + \lambda xe^t)^{-1} - e_\lambda(xe^t) e_\lambda^{-1}(x) \cdot \frac{1}{1 + \lambda x}.$$

Thus, by (38) and (41), we get

$$(42) \quad \frac{d}{dt} (e_\lambda(xe^t) \cdot e_\lambda^{-1}(x)) = x \left\{ \frac{d}{dx} (e_\lambda(xe^t) e_\lambda^{-1}(x)) + e_\lambda(xe^t) e_\lambda^{-1}(x) \frac{1}{1 + \lambda x} \right\}.$$

From (34) and (42), we can derive the following identity

$$\begin{aligned}
\sum_{n=0}^{\infty} \text{Bel}_{n+1,\lambda}(x) \frac{t^n}{n!} &= \frac{d}{dt} (e_\lambda(xe^t) \cdot e_\lambda^{-1}(x)) \\
&= x \left\{ \frac{d}{dx} (e_\lambda(xe^t) \cdot e_\lambda^{-1}(x)) + e_\lambda(xe^t) \cdot e_\lambda^{-1}(x) \frac{1}{1+\lambda x} \right\} \\
(43) \quad &= x \left\{ \sum_{n=0}^{\infty} \text{Bel}'_{n,\lambda}(x) + \frac{1}{1+\lambda x} \text{Bel}_{n,\lambda}(x) \right\} \frac{t^n}{n!} \\
&= \frac{x}{1+\lambda x} \sum_{n=0}^{\infty} \left(\text{Bel}'_{n,\lambda}(x) + \text{Bel}_{n,\lambda}(x) + \lambda x \text{Bel}'_{n,\lambda}(x) \right) \frac{t^n}{n!},
\end{aligned}$$

where $\text{Bel}'_{n,\lambda}(x) = \frac{d}{dx} \text{Bel}_{n,\lambda}(x)$.

Comparing the coefficients on the both sides of (43), we obtain the following theorem.

Theorem 9. For $n \geq 0$, we have

$$\text{Bel}_{n+1,\lambda}(x) = \frac{x}{1+\lambda x} (\text{Bel}'_{n,\lambda}(x) + \text{Bel}_{n,\lambda}(x) + \lambda x \text{Bel}'_{n,\lambda}(x)),$$

where $\text{Bel}'_{n,\lambda}(x) = \frac{d}{dx} \text{Bel}_{n,\lambda}(x)$.

By Theorem 9, we get

$$(44) \quad \text{Bel}_{n+1,\lambda}(x) = x (\text{Bel}'_{n,\lambda}(x) + \text{Bel}_{n,\lambda}(x) + \lambda x \text{Bel}'_{n,\lambda}(x) - \lambda \text{Bel}_{n+1,\lambda}(x)).$$

Thus, by Theorem 8 and (44), we have

(45)

$$\begin{aligned}
x \text{Bel}'_{n,\lambda}(x) &= \text{Bel}_{n+1,\lambda}(x) - x \text{Bel}_{n,\lambda}(x) - \lambda x^2 \text{Bel}'_{n,\lambda}(x) + \lambda x \text{Bel}_{n+1,\lambda}(x) \\
&= x \sum_{l=0}^n \binom{n}{l} (\text{Bel}_{l,\lambda}(x) - \lambda \text{Bel}_{l+1,\lambda}(x)) - x \text{Bel}_{n,\lambda}(x) - \lambda x^2 \text{Bel}'_{n,\lambda}(x) + \lambda x \text{Bel}_{n+1,\lambda}(x) \\
&= x \sum_{l=0}^{n-1} \binom{n}{l} (\text{Bel}_{l,\lambda}(x) - \lambda \text{Bel}_{l+1,\lambda}(x)) - \lambda x^2 \text{Bel}'_{n,\lambda}(x).
\end{aligned}$$

From (45), we note that

$$(46) \quad (1+\lambda x) \text{Bel}'_{n,\lambda}(x) = \sum_{l=0}^{n-1} \binom{n}{l} (\text{Bel}_{l,\lambda}(x) - \lambda \text{Bel}_{l+1,\lambda}(x)).$$

Therefore, by (46), we obtain the following theorem.

Theorem 10. For $n \in \mathbb{N}$, we have

$$\text{Bel}'_{n,\lambda}(x) = \frac{1}{1+\lambda x} \sum_{l=0}^{n-1} \binom{n}{l} (\text{Bel}_{l,\lambda}(x) - \lambda \text{Bel}_{l+1,\lambda}(x)).$$

From (8), we note that

$$\begin{aligned}
(47) \quad \sum_{n=0}^{\infty} \text{Bel}_{n,\lambda}(x) \frac{t^n}{n!} &= e_\lambda(xe^t) e_\lambda^{-1}(x) = \left(\frac{1+\lambda x e^t}{1+\lambda x} \right)^{\frac{1}{\lambda}} \\
&= \left(1 + \frac{\lambda x}{1+\lambda x} (e^t - 1) \right)^{\frac{1}{\lambda}} = \sum_{k=0}^{\infty} (1)_{k,\lambda} \left(\frac{x}{1+\lambda x} \right)^k \frac{1}{k!} (e^t - 1)^k
\end{aligned}$$

$$= \sum_{k=0}^{\infty} (1)_{k,\lambda} \left(\frac{x}{1+\lambda x} \right)^k \sum_{n=k}^{\infty} S_2(n,k) \frac{t^n}{n!} = \sum_{n=0}^{\infty} \left(\sum_{k=0}^n (1)_{k,\lambda} \left(\frac{x}{1+\lambda x} \right)^k S_2(n,k) \right) \frac{t^n}{n!}.$$

Therefore, by comparing the coefficients on both sides of (47), we obtain the following theorem.

Theorem 11. *For $n \geq 0$, we have*

$$\text{Bel}_{n,\lambda}(x) = \sum_{k=0}^n (1)_{k,\lambda} \left(\frac{x}{1+\lambda x} \right)^k S_2(n,k).$$

In particular, for $x = 1$, we have

$$\text{Bel}_{n,\lambda} = \sum_{k=0}^n (1)_{k,\lambda} \left(\frac{1}{1+\lambda} \right)^k S_2(n,k).$$

From (11), we note that

$$\begin{aligned} \sum_{n=0}^{\infty} \int_0^{\infty} e^{-2x} \text{bel}_{n,\lambda}(-x) dx \frac{t^n}{n!} &= \int_0^{\infty} e^{-2x} e^{-x(e_\lambda(t)-1)} dx = \int_0^{\infty} e^{-x(e_\lambda(t)+1)} dx \\ &= \frac{1}{e_\lambda(t)+1} = \frac{1}{e_\lambda(t)-1} - \frac{2}{e_{\frac{\lambda}{2}}(2t)-1} = \frac{1}{t} \left(\frac{t}{e_\lambda(t)-1} - \frac{2t}{e_{\frac{\lambda}{2}}(2t)-1} \right) \\ &= \frac{1}{t} \sum_{n=0}^{\infty} (\beta_{n,\lambda} - 2^n \beta_{n,\frac{\lambda}{2}}) \frac{t^n}{n!} = \sum_{n=0}^{\infty} \left(\frac{\beta_{n+1,\lambda} - 2^{n+1} \beta_{n+1,\frac{\lambda}{2}}}{n+1} \right) \frac{t^n}{n!}. \end{aligned}$$

Therefore, comparing the coefficients on both sides (48), we obtain the following theorem.

Theorem 12. *For $n \geq 0$, we have*

$$\int_0^{\infty} e^{-2x} \text{bel}_{n,\lambda}(-x) dx = \frac{\beta_{n+1,\lambda} - 2^{n+1} \beta_{n+1,\frac{\lambda}{2}}}{n+1}.$$

By (10) and (48), we get

$$\begin{aligned} \sum_{n=0}^{\infty} \frac{\beta_{n+1,\lambda} - 2^{n+1} \beta_{n+1,\frac{\lambda}{2}}}{n+1} \frac{t^n}{n!} &= \int_0^{\infty} e^{-2x} e^{-x(e_\lambda(t)-1)} dt \\ &= \sum_{k=0}^{\infty} (-1)^k \int_0^{\infty} e^{-2x} x^k dx \frac{1}{k!} (e_\lambda(t)-1)^k = \sum_{k=0}^{\infty} (-1)^k \sum_{n=k}^{\infty} S_{2,\lambda}(n,k) \frac{t^n}{n!} \int_0^{\infty} e^{-2x} x^k dx \\ &= \sum_{n=0}^{\infty} \left(\sum_{k=0}^n (-1)^k S_{2,\lambda}(n,k) \frac{k!}{2^{k+1}} \right) \frac{t^n}{n!}. \end{aligned}$$

Therefore, by (48), we obtain the following theorem.

Theorem 13. *For $n \geq 0$, we have*

$$\sum_{k=0}^n (-1)^k 2^{-k-1} k! S_{2,\lambda}(n,k) = \frac{1}{n+1} (\beta_{n+1,\lambda} - 2^{n+1} \beta_{n+1,\frac{\lambda}{2}}).$$

For $p \in \mathbb{N}$, and $\text{Re}(\delta) > 0$, we have

$$\begin{aligned} e_\lambda(x, \delta | -p) &= \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda} x^n}{n!(n+\delta)^{-p}} = \sum_{n=0}^{\infty} \left[\sum_{k=0}^p \binom{p}{k} (1)_{n,\lambda} n^k \delta^{p-k} \right] \frac{x^n}{n!} \\ &= \sum_{k=0}^p \binom{p}{k} \delta^{p-k} \left(\sum_{n=0}^{\infty} \frac{n^k}{n!} (1)_{n,\lambda} x^n \right) \\ &= e_\lambda(x) \sum_{k=0}^p \binom{p}{k} \delta^{p-k} \left(e_\lambda^{-1}(x) \sum_{n=0}^{\infty} \frac{n^k}{n!} (1)_{n,\lambda} x^n \right) \\ &= e_\lambda(x) \sum_{k=0}^p \binom{p}{k} \delta^{p-k} \text{Bel}_{k,\lambda}. \end{aligned}$$

Therefore, with the help of Theorem 8 we obtain the following theorem.

Theorem 14. For $\delta \in \mathbb{C}$ with $\text{Re}(\delta) > 0$, any $x \in \mathbb{C}$, and $p \in \mathbb{N}$, we have

$$e_\lambda(x, \delta | -p) = e_\lambda(x) \sum_{k=0}^p \binom{p}{k} \delta^{p-k} \text{Bel}_{k,\lambda}(x).$$

In particular, for $\delta = 1$, we have

$$\begin{aligned} (48) \quad e_\lambda(x, 1 | -p) &= e_\lambda(x) \sum_{k=0}^p \binom{p}{k} \text{Bel}_{k,\lambda}(x) \\ &= \frac{e_\lambda(x)}{x} \text{Bel}_{p+1,\lambda}(x) + \lambda e_\lambda(x) \sum_{l=0}^p \binom{p}{l} \text{Bel}_{l+1,\lambda}(x). \end{aligned}$$

Replacing p by $p-1$ in (48), we get

$$(49) \quad e_\lambda(x, 1 | 1-p) = \frac{e_\lambda(x)}{x} \text{Bel}_{p,\lambda}(x) + \lambda e_\lambda(x) \sum_{l=0}^{p-1} \binom{p-1}{l} \text{Bel}_{l+1,\lambda}(x).$$

From (49), we note that

$$\begin{aligned} (50) \quad e_\lambda(x, 1 | 1-p) x e_\lambda^{-1}(x) &= \text{Bel}_{p,\lambda}(x) + \lambda x \sum_{l=0}^{p-1} \binom{p-1}{l} \text{Bel}_{l+1,\lambda}(x) \\ &= (1 + \lambda x) \text{Bel}_{p,\lambda}(x) + \lambda x \sum_{l=0}^{p-2} \binom{p-1}{l} \text{Bel}_{l+1,\lambda}(x). \end{aligned}$$

Thus, by (50), we obtain

$$\text{Bel}_{p,\lambda}(x) = \frac{x e_\lambda^{-1}(x)}{1 + \lambda x} e_\lambda(x, 1 | 1-p) - \frac{\lambda}{1 + \lambda x} \sum_{l=0}^{p-2} \binom{p-1}{l} \text{Bel}_{l+1,\lambda}(x), \quad (p \geq 2).$$

3. FURTHER REMARKS

For $\delta, s \in \mathbb{C}$ with $\text{Re}(\delta) > 0$ and $\text{Re}(s) > 1$, we observe that

$$(51) \quad \int_0^\infty e_\lambda(tx, \delta | s) e^{-t} dt = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{n!(n+\delta)^s} x^n \int_0^\infty t^n e^{-t} dt = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n+\delta)^s} x^n.$$

From (51), we may consider the degenerate Lerch zeta function which is given by

$$(52) \quad \Phi_\lambda(x, s, \delta) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n+\delta)^s} x^n, \quad (\text{Re}(\delta) > 0).$$

Note that $\lim_{\lambda \rightarrow 0} \Phi_\lambda(x, s, \delta) = \Phi(x, s, \delta)$, where $\Phi(x, s, \delta)$ is Lerch zeta function defined by

$$\Phi(x, s, \delta) = \sum_{n=0}^{\infty} \frac{x^n}{(n + \delta)^s}, \quad (\text{see [1, 18]}).$$

In particular, for $x = 1$, we have

$$(53) \quad \Phi_\lambda(1, s, \delta) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n + \delta)^s}, \quad (\text{Re}(\delta) > 0).$$

In addition, Hurwitz zeta function is defined as

$$(54) \quad \zeta(s, \delta) = \sum_{n=0}^{\infty} \frac{1}{(n + \delta)^s}, \quad (\text{Re}(\delta) > 0).$$

In light of (54), we denote $\Phi_\lambda(1, s, \delta)$ in (53) by $\zeta_\lambda(s, \delta)$ and call it the degenerate Hurwitz zeta function as follows:

$$(55) \quad \zeta_\lambda(s, \delta) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n + \delta)^s}, \quad (\text{Re}(\delta) > 0).$$

Note that $\lim_{\lambda \rightarrow 0} \zeta_\lambda(s, \delta) = \zeta(s, \delta)$.

Let us take $\delta = 1$. Then, by (55), we get

$$(56) \quad \zeta_\lambda(s, 1) = \sum_{n=0}^{\infty} \frac{(1)_{n,\lambda}}{(n + 1)^s} = \sum_{n=1}^{\infty} \frac{(1)_{n-1,\lambda}}{n^s}.$$

In view of (56), we may consider the degenerate Riemann zeta function given by

$$(57) \quad \zeta_\lambda(s) = \zeta_\lambda(s, 1) = \sum_{n=1}^{\infty} \frac{(1)_{n-1,\lambda}}{n^s}, \quad (\text{Re}(s) > 1).$$

By (3), we get

$$(58) \quad \begin{aligned} \sum_{k=0}^{n-1} e_\lambda^k(t) &= \frac{1}{e_\lambda(t) - 1} (e_\lambda^n(t) - 1) = \frac{1}{t} \left\{ \frac{t}{e_\lambda(t) - 1} e_\lambda^n(t) - \frac{t}{e_\lambda(t) - 1} \right\} \\ &= \frac{1}{t} \sum_{p=0}^{\infty} (\beta_{p,\lambda}(n) - \beta_{p,\lambda}) \frac{t^p}{p!} = \sum_{p=0}^{\infty} \left(\frac{\beta_{p+1,\lambda}(n) - \beta_{p+1,\lambda}}{p+1} \right) \frac{t^p}{p!}. \end{aligned}$$

On the other hand,

$$(59) \quad \sum_{k=0}^{n-1} e_\lambda^k(t) = \sum_{k=0}^{n-1} \sum_{p=0}^{\infty} \frac{(k)_{p,\lambda}}{p!} t^p = \sum_{p=0}^{\infty} \left(\sum_{k=0}^{n-1} (k)_{p,\lambda} \right) \frac{t^p}{p!}.$$

From (58) and (59), we have

$$(60) \quad \sum_{k=0}^{n-1} (k)_{p,\lambda} = \frac{1}{p+1} \{ \beta_{p+1,\lambda}(n) - \beta_{p+1,\lambda} \},$$

where n is a positive integer and p is non-negative integer. By (60), we easily get

$$\sum_{k=0}^{n-1} (k)_{p,\lambda} = \frac{1}{p+1} \sum_{l=0}^p \binom{p+1}{l} (n)_{l,\lambda} \beta_{p+1-l,\lambda}.$$
