ON THE MILNOR FIBRATION OF CERTAIN
NEWTON DEGENERATE FUNCTIONS

CHRISTOPHE EYRAL AND MUTSUO OKA

ABSTRACT. It is well known that the diffeomorphism-type of the Milnor fibration of a (Newton) non-degenerate polynomial function $f$ is uniquely determined by the Newton boundary of $f$. In the present paper, we generalize this result to certain degenerate functions, namely we show that the diffeomorphism-type of the Milnor fibration of a (possibly degenerate) polynomial function of the form $f = f^1 \cdots f^n$ is uniquely determined by the Newton boundaries of $f^1, \ldots, f^n$ if $\{f^{k_1} = \cdots = f^{k_m} = 0\}$ is a non-degenerate complete intersection variety for any $k_1, \ldots, k_m \in \{1, \ldots, b_0\}$.

1. Introduction

Let $f(z)$ and $g(z)$ be two non-constant polynomial functions of $n$ complex variables $z = (z_1, \ldots, z_n)$ such that $f(0) = g(0) = 0$ ($f$ and $g$ may have a non-isolated singularity at $0$). The goal of this paper is to find “easy-to-check” conditions on the functions $f$ and $g$ that guarantee that their Milnor fibrations at $0$ are isomorphic (i.e., there is a fibre-preserving diffeomorphism from the total space of the Milnor fibration of $f$ onto that of $g$). In [9], the second named author proved that if $f$ and $g$ are (Newton) non-degenerate and have the same Newton boundary, then necessarily they have isomorphic Milnor fibrations (the special cases where, in addition, $f$ is weighted homogeneous or has an isolated singularity at $0$ were first proved in [8] and [7] respectively). The crucial step in the proof of this result is a similar assertion, also proved in [9], for 1-parameter families of functions. It says that if $t_0 > 0$ and if $\{f_t\}_{|t| \leq t_0}$ is a family of non-degenerate polynomial functions with the same Newton boundary, then the Milnor fibrations of $f_t$ and $f_0$ at $0$ are isomorphic for any $t$, $|t| \leq t_0$. This theorem, in turn, is a consequence of another important result, still proved in [9], which asserts that any family $\{f_t\}_{|t| \leq t_0}$ satisfying the above conditions has a so-called “uniform stable radius” for the Milnor fibrations of its elements $f_t$.

Though the scope of the above mentioned theorems is relatively wide, it does not include, for instance, the following quite common situation. Suppose that $f(z)$ is the product of $k_0 \geq 2$ polynomial functions $f^1(z), \ldots, f^{k_0}(z)$ on $\mathbb{C}^n$ with $n \geq 3$ (so, in particular, we have $\dim_0(V(f^k) \cap V(f^{k'})) \geq n-2 \geq 1$, where, as usual, $V(f^k)$ and $V(f^{k'})$ denote the hypersurfaces defined by $f^k$ and $f^{k'}$ respectively; here, the upper index denotes an index, not a power). Then we claim that $f$ is never non-degenerate (and hence the results of [9] do not apply to this situation). If $f$ is “convenient” (i.e., if its Newton boundary intersects each coordinate axis), then our claim is an immediate consequence of a theorem of Kouchnirenko [5] which asserts that a convenient non-degenerate function always has an isolated singularity at the origin. In the above situation, since for $k \neq k'$ the intersection $V(f^k) \cap V(f^{k'})$ is contained in the singular locus of $V(f)$, if the function $f$ is convenient then Kouchnirenko’s theorem...
implies that it must be “degenerate” (i.e., not non-degenerate). In the case where \( f \) is not a convenient function, our claim follows from a theorem of Bernstein [1] and Proposition (2.3) in Chapter 4 of [10] which imply that for \( k \neq k' \) the intersection \( V(f^k_w) \cap V(f^k'_w) \cap \mathbb{C}^{n_m} \) is non-empty whenever \( w \in \mathbb{N}^{m_n} \) is such that \( f^k_w \) and \( f^k'_w \) are not monomials and the dimension of the Minkowski sum \( \Delta(w; f^k) + \Delta(w; f^{k'}) \) is \( \geq 2 \). Here, \( \Delta(w; f^k) \) (respectively, \( f^k_w \)) denotes the face of the Newton polyhedron of \( f^k \) (respectively, the face function of \( f^k \)) with respect to \( w \); similarly for the function \( f^{k'} \); see Section 2 for the definitions. Of course, this implies that the face function \( f_w^k \) of \( f \) with respect to \( w \) has a critical point in \( V(f^k_w) \cap \mathbb{C}^{n_m} \), that is, \( f \) is degenerate.

In the present paper, we generalize the results of [9] to a class of polynomial functions that includes the “degenerate” examples mentioned above. A first class of such functions was already given by the authors in [2] in the case of 1-parameter families of functions of the form \( f_t(z) = f^1_t(z) \cdots f^{k_0}_t(z) \) under a condition called Newton-admissibility. This condition says that the Newton boundaries of the functions \( f^k_t \) which appear in the product must be independent of \( t \) and the (germs at \( 0 \) of the) varieties \( V(f^{k_1}_t, \ldots, f^{k_m}_t) := \{ f_{t}^{k_1} = \cdots = f_{t}^{k_m} = 0 \} \) must be non-degenerate, uniformly locally tame, complete intersection varieties for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0 \} \). The uniform local tameness is a non-degeneracy type condition with respect to the variables corresponding to the “compact directions” of the non-compact faces of the Newton polyhedron, the variables corresponding to the “non-compact directions” being fixed in a small ball independent of \( t \) (for a precise definition, see [2]).

In fact, under the Newton-admissibility condition, we proved in [2] a much stronger result on the local geometry of the family of hypersurfaces \( V(f_t) \): we showed that any Newton-admissible family is Whitney equisingular and satisfies Thom’s condition. Then, as a consequence of these two results, we easily obtained that the Milnor fibrations of \( f_t \) and \( f_0 \) at the origin are isomorphic for all small \( t \). Note that in the case of non-isolated singularities, the Newton-admissibility condition is a crucial assumption when we want to study geometric properties like Whitney equisingularity or Thom’s condition. However, if our goal is only to investigate the Milnor fibrations of the family members \( f_t \), then, as we are going to show in the present work, the uniform local tameness condition (which appears through the Newton-admissibility condition) can be completely dropped.

Our first main theorem here says that if the Newton boundaries of the functions \( f^k \) \((1 \leq k \leq k_0)\) are independent of \( t \) and if the varieties \( V(f^{k_1}_t, \ldots, f^{k_m}_t) \) are non-degenerate complete intersection varieties for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0 \} \), then the Milnor fibrations of \( f_t \) and \( f_0 \) at \( 0 \) are isomorphic for all small \( t \) (see Theorem 1.3). The main step to prove this theorem is the following assertion which is interesting itself. It says that, under the same assumptions, the family \( \{f_t\} \) has a uniform stable radius (see Theorem 1.3 and Corollary 1.4). In the course of the proof of this assertion, we also show how a stable radius for the Milnor fibration of a function of the form \( f(z) = f^1(z) \cdots f^{k_0}(z) \) can be obtained when the corresponding varieties \( V(f^{k_1}, \ldots, f^{k_m}) \) are non-degenerate complete intersection varieties for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0 \} \) (see Theorem 1.5).

Our second main theorem, which is deduced from the first one, asserts that given two polynomial functions \( f(z) = f^1(z) \cdots f^{k_0}(z) \) and \( g(z) = g^1(z) \cdots g^{k_0}(z) \), if \( V(f^{k_1}, \ldots, f^{k_m}) \) and \( V(g^{k_1}, \ldots, g^{k_m}) \) are non-degenerate complete intersection varieties for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0 \} \), and if for each \( 1 \leq k \leq k_0 \), the Newton boundaries of \( f^k \) and \( g^k \) coincide, then the Milnor fibrations of \( f \) and \( g \) at \( 0 \) are isomorphic (see Theorem 1.5).

Note that in the special case where \( k_0 = 1 \) (for which the functions under consideration are necessarily non-degenerate), we recover all the results of [9]—a paper from which the present work is inspired.
2. Non-degenerate complete intersection varieties

Let \( z := (z_1, \ldots, z_n) \) be coordinates for \( \mathbb{C}^n \), and let \( f(z) = \sum_{\alpha} c_\alpha z^\alpha \) be a non-constant polynomial function which vanishes at the origin. Here, \( \alpha := (\alpha_1, \ldots, \alpha_n) \in \mathbb{N}^n \), \( c_\alpha \in \mathbb{C} \), and \( z^\alpha \) is a notation for the monomial \( z_1^{\alpha_1} \cdots z_n^{\alpha_n} \). For any \( I \subseteq \{1, \ldots, n\} \), we denote by \( \mathbb{C}^I \) (respectively, \( \mathbb{C}^{*I} \)) the set of points \( (z_1, \ldots, z_n) \in \mathbb{C}^n \) such that \( z_i = 0 \) if \( i \notin I \) (respectively, \( z_i = 0 \) if and only if \( i \notin I \)). In particular, we have \( \mathbb{C}^0 = \mathbb{C}^{*0} = \{0\} \) and \( \mathbb{C}^{*\{1, \ldots, n\}} = \mathbb{C}^n \), where \( \mathbb{C}^* := \mathbb{C} \setminus \{0\} \). Throughout this paper, we are only interested in a local situation, that is, in (arbitrarily small representatives of) germs at the origin.

To start with, let us recall the definition of a non-degenerate complete intersection variety, which is a key notion in this paper (a standard reference for this is [10]).

The Newton polyhedron \( \Gamma_+(f) \) of the germ of \( f \) at the origin \( 0 \in \mathbb{C}^n \) (with respect to the coordinates \( z = (z_1, \ldots, z_n) \)) is the convex hull in \( \mathbb{R}_+^n \) of the set

\[
\bigcup_{c_\alpha \neq 0} (\alpha + \mathbb{R}_+^n).
\]

The Newton boundary of \( f \) (denoted by \( \Gamma(f) \)) is the union of the compact faces of \( \Gamma_+(f) \). For any weight vector \( w := (w_1, \ldots, w_n) \in \mathbb{N}^n \), let \( d(w; f) \) be the minimal value of the restriction to \( \Gamma_+(f) \) of the linear map

\[
x = (x_1, \ldots, x_n) \in \mathbb{R}^n \mapsto \sum_{i=1}^n x_i w_i \in \mathbb{R},
\]

and let \( \Delta(w; f) \) be the (possibly non-compact) face of \( \Gamma_+(f) \) defined by

\[
\Delta(w; f) = \left\{ x \in \Gamma_+(f) : \sum_{i=1}^n x_i w_i = d(w; f) \right\}.
\]

Note that if all the \( w_i \)'s are positive, then \( \Delta(w; f) \) is a (compact) face of \( \Gamma(f) \), while if \( w = 0 \), then \( \Delta(w; f) = \Gamma_+(f) \). The face function of \( f \) with respect to \( w \) is the function

\[
z \in \mathbb{C}^n \mapsto \sum_{\alpha \in \Delta(w; f)} c_\alpha z^\alpha \in \mathbb{C}.
\]

Hereafter, this function will be denoted by \( f_w \) or \( f_{\Delta(w; f)} \).

Now, consider the set \( I(f) \) consisting of all subsets \( I \subseteq \{1, \ldots, n\} \) such that the restriction of \( f \) to \( \mathbb{C}^I \) (denoted by \( f^I \)) does not identically vanishes. Clearly, \( I \in I(f) \) if and only if \( \Gamma(f^I) = \Gamma(f) \cap \mathbb{R}^I \) is not empty, where \( \mathbb{R}^I \) is defined in a similar way as \( \mathbb{C}^I \). Hereafter, for any weight vector \( w \in \mathbb{N}^I \), we shall use the simplified following notation:

\[
f^{I}_{w} := (f^{I})_{w} \quad \text{and} \quad f^{I}_{\Delta(w;f^I)} := (f^{I})_{\Delta(w;f^I)}.
\]

(Of course, \( \mathbb{N}^I \) is defined in a similar way as \( \mathbb{C}^I \) and \( \mathbb{R}^I \).) Note that for all \( w \in \mathbb{N}^I \), we have

\[
f^{I}_{w} \equiv f^{I}_{\Delta(w;f^I)} = f_{\Delta(w;f^I)}.
\]

Definition 2.1 (see [5]). The germ at \( 0 \) of the hypersurface \( V(f) := f^{-1}(0) \subseteq \mathbb{C}^n \) is called non-degenerate if for any “positive” weight vector \( w \in \mathbb{N}^{*n} \) (i.e., \( w_i > 0 \) for all \( i \)), the hypersurface

\[
V^*(f_w) := \{ z \in \mathbb{C}^{*n} \mid f_w(z) = 0 \}
\]

is a reduced, non-singular, hypersurface in the complex torus \( \mathbb{C}^{*n} \). This means that \( f_w \) has no critical point in \( V^*(f_w) \), that is, the 1-form \( df_w \) is nowhere vanishing in \( V^*(f_w) \). We emphasize that \( V^*(f_w) \) is globally defined in \( \mathbb{C}^{*n} \).
Now, consider $k_0$ non-constant polynomial functions $f^1(z), \ldots, f^{k_0}(z)$ which all vanish at the origin.

**Definition 2.2** (see [10]). We say that the germ at $0$ of the variety

$$V(f^1, \ldots, f^{k_0}) := \{ z \in \mathbb{C}^n \mid f^1(z) = \cdots = f^{k_0}(z) = 0 \}$$

is a germ of a non-degenerate complete intersection variety if for any positive weight vector $w \in \mathbb{N}^n$, the variety

$$V^*(f^1_w, \ldots, f^{k_0}_w) := \{ z \in \mathbb{C}^n \mid f^1_w(z) = \cdots = f^{k_0}_w(z) = 0 \}$$

is a reduced, non-singular, complete intersection variety in $\mathbb{C}^n$, that is, the $k_0$-form

$$df^1_w \wedge \cdots \wedge df^{k_0}_w$$

is nowhere vanishing in $V^*(f^1_w, \ldots, f^{k_0}_w)$. Again, we emphasize that $V^*(f^1_w, \ldots, f^{k_0}_w)$ is globally defined in $\mathbb{C}^n$.

**Remark 2.3.** If $V(f^1, \ldots, f^{k_0})$ is a germ of a non-degenerate complete intersection variety, then, by [10] Chapter III, Lemma (2.2)], for any $I \in \mathcal{I}(f^1) \cap \cdots \cap \mathcal{I}(f^{k_0})$, the germ at $0$ of the variety

$$V^I(f^1, \ldots, f^{k_0}) := \{ z \in \mathbb{C}^I \mid f^1(z) + \cdots + f^{k_0}(z) = 0 \}$$

is a germ of a non-degenerate complete intersection variety too. In other words, for any $w \in \mathbb{N}^I$, the $k_0$-form $df^1_w \wedge \cdots \wedge df^{k_0}_w$ is nowhere vanishing in

$$V^I(f^1_w, \ldots, f^{k_0}_w) := \{ z \in \mathbb{C}^I \mid f^1_w(z) + \cdots + f^{k_0}_w(z) = 0 \}.$$

(As usual, $f^k$ is the restriction of $f^k$ to $\mathbb{C}^I$ and $f^k_w$ is the face function $(f^k)_w \equiv (f^k)_\lambda(w; f^1, \ldots, f^k)$.)

### 3. Stable radius for the Milnor fibration

Let again $f^1(z), \ldots, f^{k_0}(z)$ be non-constant polynomial functions of $n$ complex variables $z = (z_1, \ldots, z_n)$ such that $f^k(0) = 0$ for all $1 \leq k \leq k_0$.

**Assumptions 3.1.** Throughout this section, we assume that for any $k_1, \ldots, k_m \in \{1, \ldots, k_0\}$, the germ of the variety $V(f^{k_1}, \ldots, f^{k_m})$ at $0$ is the germ of a non-degenerate complete intersection variety.

We start with the following lemma which is crucial for the paper. Note that in the special case where $k_0 = 1$, the function $f^1$ (or the hypersurface $V(f^1)$) is non-degenerate, and the lemma below coincides with Lemma 1 of [9].

**Lemma 3.2.** Under Assumptions 3.1, there exists $\varepsilon > 0$ such that for any $k_1, \ldots, k_m \in \{1, \ldots, k_0\}$, any $I \subseteq \{1, \ldots, n\}$ with $I \in \mathcal{I}(f^{k_1}) \cap \cdots \cap \mathcal{I}(f^{k_m})$, any weight vector $w = (w_1, \ldots, w_n) \in \mathbb{N}^I$ and any (possibly zero) $\lambda \in \mathbb{C}$, if $a = (a_1, \ldots, a_n)$ is a point in $\mathbb{C}^I$ satisfying the following two conditions:

1. $f^{k_1}_w(a) = \cdots = f^{k_m}_w(a) = 0$;
2. there exists a $m$-tuple $(\mu_{k_1}, \ldots, \mu_{k_m}) \in \mathbb{C}^m \setminus \{0\}$ such that for all $i \in I$:
   $$\sum_{j=1}^m \frac{\partial f^{k_j}_w}{\partial z_i}(a) = \begin{cases} a_i & \text{if } i \in I \cap I(w), \\ 0 & \text{if } i \in I \setminus I(w), \end{cases}$$

where $\bar{a}_i$ is the complex conjugate of $a_i$ and $I(w) := \{ i \in \{1, \ldots, n\}; w_i = 0 \}$; then we must have

$$a \notin \left\{ z \in \mathbb{C}^I; \sum_{i \in I \cap I(w)} |z_i|^2 \leq \varepsilon^2 \right\}.$$
We shall prove Lemma 3.2 at the end of this section. First, let us use it in order to prove the following first important theorem.

**Theorem 3.3.** Under Assumptions 3.1, if \( f(z) := f^1(z) \cdots f^{k_0}(z) \), then the number \( \varepsilon \) which appears in Lemma 3.2 is a stable radius for the Milnor fibration of \( f \).

We recall that \( \varepsilon \) is called a stable radius for the Milnor fibration of \( f \) if for any \( 0 < \varepsilon_1 < \varepsilon_2 < \varepsilon \), there exists \( \delta(\varepsilon_1, \varepsilon_2) > 0 \) such that for any \( \eta \in \mathbb{C} \) with \( 0 < |\eta| \leq \delta(\varepsilon_1, \varepsilon_2) \), the hypersurface \( f^{-1}(\eta) \subseteq \mathbb{C}^n \) is non-singular in \( B_\varepsilon := \{z \in \mathbb{C}^n; \|z\| < \varepsilon\} \) and transversely intersects the spheres \( S_{\varepsilon_1} := \{z \in \mathbb{C}^n; \|z\| = \varepsilon_1\} \) for any \( \varepsilon_1 \leq \varepsilon \leq \varepsilon_2 \). The existence of such a radius was proved by H. A. Hamm and Lê Dũng Tráng in [4, Lemme (2.1.4)].

**Proof of Theorem 3.3.** We argue by contradiction. By [6, Corollary 2.8], for \( \delta > 0 \) small enough, the fibres \( f^{-1}(\eta) \cap B_\varepsilon \) are non-singular for any \( \eta, 0 < |\eta| \leq \delta \). It follows that if the assertion in Theorem 3.3 is not true, then, by the Curve Selection Lemma (see [3.6]), there exists a real analytic curve \( z(s) = (z_1(s), \ldots, z_n(s)) \) in \( \mathbb{C}^n, 0 \leq s \leq 1 \), and a family of complex numbers \( \lambda(s), 0 < s \leq 1 \), satisfying the following three conditions:

(i) \( \frac{\partial}{\partial \varepsilon}(z(s)) = \lambda(s)\varepsilon_i(s) \) for \( 1 \leq i \leq n \) and \( s \neq 0 \);

(ii) \( f(z(0)) = 0 \) but \( f(z(s)) \) is not constantly zero;

(iii) there exists \( \varepsilon' > 0 \) such that \( \|z(s)\| \leq \varepsilon \).

Note that, by (i) and (ii), \( \lambda(s) \neq 0 \) and we can express it in a Laurent series

\[
\lambda(s) = \lambda_0 s^c + \cdots,
\]

where \( \lambda_0 \in \mathbb{C}^* \). Throughout, the dots “…” stand for the higher order terms. Let \( I := \{i; z_i(s) \neq 0\} \). By (ii), \( I \in \mathcal{I}(f) \), and hence \( I \in \mathcal{I}(f^1) \cap \cdots \cap \mathcal{I}(f^{k_0}) \). For each \( i \in I \), consider the Taylor expansion

\[
z_i(s) = a_is^{w_i} + \cdots,
\]

where \( a_i \in \mathbb{C}^* \) and \( w_i \in \mathbb{N} \).

**Claim 3.4.** There exists \( 1 \leq k \leq k_0 \) such that \( f^{k,l}_w(a) \equiv (f^{k,l}_w)(a) = 0 \), where \( a \) and \( w \) are the points in \( \mathbb{C}^* \) and \( \mathbb{N}^* \), respectively, whose \( i \)th coordinates \( (i \in I) \) are \( a_i \) and \( w_i \) respectively.

Hereafter, to simplify the notation, we shall assume that \( I = \{1, \ldots, n\} \), so that the function \( f^{k,l} \) is simply written as \( f^k \), the intersection \( I \cap I(w) \) is written as \( I(w) \) (where, as in Lemma 3.2, \( I(w) \) is the set of all indexes \( i \in \{1, \ldots, n\} \) for which \( w_i = 0 \)), and so on. The argument for a general \( I \) is completely similar.

Before proving Claim 3.4, let us first complete the proof of Theorem 3.3. For that purpose, we look at the set consisting of all integers \( k \) for which \( f^{k,l}_w(a) = 0 \), which is not empty by Claim 3.4. For simplicity again, we shall assume:

\[
f^{k,l}_w(a) = 0 \quad \text{for} \quad 1 \leq k \leq k_0' \leq k_0;
\]

\[
f^{k,l}_w(a) \neq 0 \quad \text{for} \quad k_0' + 1 \leq k \leq k_0.
\]

Write \( f = f^1 \cdots f^{k_0} \cdot h \), where \( h := f^{k_0+1} \cdots f^{k_0} \) if \( k_0' \leq k_0 - 1 \) and \( h := 1 \) if \( k_0' = k_0 \). Then for all \( 1 \leq i \leq n \), we have

\[
\frac{\partial f}{\partial z_i}(z(s)) = \sum_{k=1}^{k_0'} \left( \frac{\partial f^k}{\partial z_i}(z(s)) \cdot h(z(s)) \cdot \prod_{1 \leq \ell \leq k_0' \text{ and } \ell \neq k} f^\ell(z(s)) \right) + \frac{\partial h}{\partial z_i}(z(s)) \cdot \prod_{1 \leq k \leq k_0'} f^k(z(s)).
\]
For each 1 ≤ k ≤ k′ 0, if o_k = ord f^k(z(s)) denotes the order (in s) of f^k(z(s)) and if e_k := d(w; f^k) - o_k + \sum_{\ell=1}^{k_0} o_{\ell}, then

\begin{equation}
\text{ord} \left( \frac{\partial f^k}{\partial z_i}(z(s)) \cdot h(z(s)) \cdot \prod_{i \leq k_0 \land i \neq k} f^i(z(s)) \right) \geq d(w; h) - w_i + e_k,
\end{equation}

and the equality holds if and only if \frac{\partial f^k}{\partial z_i}(a) \neq 0. Since o_k > d(w; f^k) for 1 ≤ k ≤ k′ 0, we also have

\begin{equation}
\text{ord} \left( \frac{\partial h}{\partial z_i}(z(s)) \cdot \prod_{i=1}^{k_0} f^i(z(s)) \right) \geq d(w; h) - w_i + \sum_{\ell=1}^{k_0} o_{\ell} > d(w; h) - w_i + e_k
\end{equation}

for all 1 ≤ k ≤ k′ 0. Still for simplicity, let us assume that \epsilon_{\min} := \epsilon_1 = \cdots = \epsilon_{k_0′ + 1} \leq \cdots \leq \epsilon_{k′_0}.

The relations (3.1), (3.2) and (3.3) show that there exist \mu_1, \ldots, \mu_{k_0′} \in \mathbb{C}^n such that for any 1 ≤ i ≤ n:

\begin{equation}
\frac{\partial f}{\partial z_i}(z(s)) = \sum_{k=1}^{k_0′} \frac{\partial f^k}{\partial z_i}(a) \cdot \mu_k \cdot s^{d(w; h) - w_i + \epsilon_{\min} + \cdots},
\end{equation}

and hence, by multiplying both sides of the relation (i) by s^{w_i}:

\begin{equation}
\sum_{k=1}^{k_0′} \frac{\partial f^k}{\partial z_i}(a) \cdot \mu_k \cdot s^{d(w; h) + \epsilon_{\min} + \cdots} = \lambda_0 \bar{a}_i s^{c + 2w_i} + \cdots.
\end{equation}

Note that the coefficient \lambda_0 \bar{a}_i of s^{c + 2w_i} on the right-hand side of (3.4) being non-zero, we must have d(w; h) + \epsilon_{\min} ≤ c + 2w_i for any 1 ≤ i ≤ n, and since I(w) \neq \emptyset (by (iii)), in fact we have d(w; h) + \epsilon_{\min} ≤ c. It follows that for any i \notin I(w), the sum

S_i := \sum_{k=1}^{k_0′} \mu_k \frac{\partial f^k}{\partial z_i}(a)

vanishes. (Indeed, if there exists i_0 \notin I(w) such that S_{i_0} \neq 0, then c + 2w_{i_0} = d(w; h) + \epsilon_{\min} ≤ c, which is a contradiction.) Now, if we also have S_i = 0 for all i \in I(w), then the condition (2) of Lemma 3.2 is satisfied. (Note that the complex number denoted by \lambda in Lemma 3.2 may vanish.) However, the relation (iii) implies

\begin{equation}
a \in \left\{ z \in \mathbb{C}^n; \sum_{i \in I(w)} |z_i|^2 \leq \epsilon^2 \right\},
\end{equation}

which contradicts the conclusion of this lemma. If there exists i_0 \in I(w) such that S_{i_0} \neq 0, then it follows that S_i \neq 0 for any i \in I(w), so that for all such i’s:

\begin{equation}
S_i = \sum_{k=1}^{k_0′} \mu_k \frac{\partial f^k}{\partial z_i}(a) = \lambda_0 \bar{a}_i.
\end{equation}

Thus the condition (2) of Lemma 3.2 is satisfied in this case too, and again the relation (iii) (which implies (3.5)) leads to a contradiction with the conclusion of the lemma. So, up to Claim 3.4, the theorem is proved.

To complete the proof of the theorem, it remains to prove Claim 3.4.
Proof of Claim 3.4. Again, to simplify, we assume $I = \{1, \ldots, n\}$, so that $f_{k, I} = f_k$, $I \cap I(w) = I(w)$, etc. We argue by contradiction. Suppose $f_{w}^{k}(a) \neq 0$ for all $1 \leq k \leq k_0$. Then $d(w; f_k) = o_k$ for all $1 \leq k \leq k_0$, where $o_k$ is the order of $f_k(z(s))$. Also, note that, by (ii), there exists $1 \leq k_1 \leq k_0$ such that $f_{k_1}(z(0)) = 0$. If $I(w) = \{1, \ldots, n\}$, then $d(w; f_{k_1}) = 0$ and

$$f_{k_1}(z(s)) = f_{w}^{k_1}(a) s^{0} + \cdots,$$

and therefore $0 = f_{k_1}(z(0)) = f_{w}^{k_1}(a)$, which is a contradiction. So, from now on, suppose that $I(w)$ is a proper subset of $\{1, \ldots, n\}$ and $d(w; f_{k_1}) \neq 0$. Put $e := \sum_{k=1}^{k_0} o_k$. Then, as above, there exist non-zero complex numbers $\mu_1, \ldots, \mu_k$ (actually, here, for each $k$, $\mu_k = \prod_{\ell \neq k} f_{w}^{\ell}(a)$) such that for any $1 \leq i \leq n$:

$$\frac{\partial f}{\partial z_i}(z(s)) = \sum_{k=1}^{k_0} \frac{\partial f_{w}^{k}}{\partial z_i}(a) \cdot \mu_k \cdot s^{-w_i + e} + \cdots,$$

and hence, by multiplying both sides of the relation (i) by $s^{w_i}$:

$$\sum_{k=1}^{k_0} \frac{\partial f_{w}^{k}}{\partial z_i}(a) \cdot \mu_k \cdot s^{e} + \cdots = \lambda_0 a_i s^{c + 2w_i} + \cdots.$$

Again, since $\lambda_0 a_i \neq 0$ and $I(w) \neq \emptyset$, we have $e \leq c$ and the sum $\sum_{k=1}^{k_0} \mu_k \frac{\partial f_{w}^{k}}{\partial z_i}(a)$ vanishes for all $i \in I(w)^c := \{1, \ldots, n\} \setminus I(w)$. As $f_{w}^{k}$ is weighted homogeneous, this, together with the Euler identity, implies that

$$0 = \sum_{i \in I(w)^c} a_i w_i \left( \sum_{k=1}^{k_0} \frac{\partial f_{w}^{k}}{\partial z_i}(a) \cdot \mu_k \right) = \sum_{i \in I(w)^c} \left( \prod_{\ell \neq k} f_{w}^{\ell}(a) \cdot \sum_{i \in I(w)^c} a_i w_i \frac{\partial f_{w}^{k}}{\partial z_i}(a) \right) = \sum_{k=1}^{k_0} \left( \prod_{\ell \neq k} f_{w}^{\ell}(a) \right) \cdot d(w; f_{k}) \cdot f_{w}^{k}(a) = \left( \prod_{\ell=1}^{k_0} f_{w}^{\ell}(a) \right) \cdot \sum_{k=1}^{k_0} d(w; f_{k}) \neq 0,$$

which is a contradiction too. \qed

This completes the proof of Theorem 3.3 (up to Lemma 3.2). \qed

Now let us prove Lemma 3.2.

Proof of Lemma 3.2. First, observe that if the assertion fails for some $k_1, \ldots, k_m$, $I$ and $\Delta(w; f_{k_1}), \ldots, \Delta(w; f_{k_m})$ such that $I \cap I(w) = \emptyset$, then for any $\varepsilon > 0$ the set

$$\left\{ z \in \mathbb{C}^I : \sum_{i \in I \setminus I(w) = \emptyset} |z_i|^2 \leq \varepsilon^2 \right\}$$

is nothing but $\mathbb{C}^I$ and there exists a point $a$ in it that satisfies the conditions (1) and (2) of the lemma; in particular, $a \in V^I(f_{w}^{k_1}, \ldots, f_{w}^{k_m})$ and the vectors $z^{k_1}(a), \ldots, z^{k_m}(a) \in \mathbb{C}^I$ whose $i$th coordinates ($i \in I$) are

$$\frac{\partial f_{w}^{k_1}}{\partial z_i}(a), \ldots, \frac{\partial f_{w}^{k_m}}{\partial z_i}(a),$$

respectively, are linearly dependent, that is,

$$df_{w}^{k_1}(a) \wedge \cdots \wedge df_{w}^{k_m}(a) = 0.$$
However, since \( I \in \mathcal{I}(f_{k_1}) \cap \cdots \cap \mathcal{I}(f_{k_m}) \) and \( I \cap I(w) = \emptyset \), this contradicts Assumptions \( \mathfrak{A}_1 \) which imply

\[
df_{k_j,I}(p) \wedge \cdots \wedge df_{k_m,I}(p) \neq 0
\]

for any \( p \in V^*(f_{k_1}, \ldots, f_{k_m}) \) (see Remark \( \mathfrak{A}_3 \)).

Now, assume that the assertion in Lemma \( \mathfrak{A}_2 \) fails for some \( k_1, \ldots, k_m, I \) and \( \Delta(w; f_{k_1}), \ldots, \Delta(w; f_{k_m}) \) such that \( I \cap I(w) \neq \emptyset \). Again, without loss of generality, and in order to simplify the notation, we assume that \( I = \{1, \ldots, n \} \), so that \( f_{k_j,I} = f_{k_j}^I, I \cap I(w) = I(w), \mathbb{C}^*I = \mathbb{C}^n \), etc. Then there is a sequence \( \{p_q\}_{q \in \mathbb{N}} \) of points in \( \mathbb{C}^n \) and a sequence \( \{\lambda_q\}_{q \in \mathbb{N}} \) of complex numbers such that:

1. \( f_{k_j}^I(p_q) = \cdots = f_{k_m}^I(p_q) = 0 \) for all \( q \in \mathbb{N} \);
2. there exists a sequence \( \{\mu_{k_1,q}, \ldots, \mu_{k_m,q}\}_{q \in \mathbb{N}} \) of points in \( \mathbb{C}^n \setminus \{0\} \) such that for all \( q \in \mathbb{N} \) and all \( 1 \leq i \leq n \):
   \[
   \sum_{j=1}^m \mu_{k_j,q} \frac{\partial f_{w}^{k_j}}{\partial z_i}(p_q) = \begin{cases} 
   \lambda_q \bar{p}_{q,i} & \text{if } i \in I(w), \\
   0 & \text{if } i \notin I(w),
   \end{cases}
   \]
   where, for each \( 1 \leq i \leq n \), \( \bar{p}_{q,i} \) denotes the conjugate of the \( i \)-th coordinate \( p_{q,i} \) of \( p_q \);
3. \( \sum_{i \in I(w)} |p_{q,i}|^2 \to 0 \) as \( q \to \infty \).

For any \( \zeta \in \mathbb{C} \) and any \( z \in \mathbb{C}^n \), let \( \zeta \ast z = ((\zeta \ast z)_1, \ldots, (\zeta \ast z)_n) \) be the point of \( \mathbb{C}^n \) defined by

\[
(\zeta \ast z)_i := \zeta^{|w_i|} z_i = \begin{cases} z_i & \text{for } i \in I(w), \\
|z_i|^{-1} & \text{for } i \notin I(w),
   \end{cases}
\]

Then pick a sequence \( \{\zeta_q\}_{q \in \mathbb{N}} \) of points in \( \mathbb{C}^* \) that converges to zero sufficiently fast so that the sequence \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) converges to the origin of \( \mathbb{C}^n \). Clearly, \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) also satisfies the above properties (1), (2) and (3). Indeed, for any \( 1 \leq j \leq m \), we have

\[
f_{k_j}^I(\zeta_q \ast p_q) = e^{d(w; f_{k_j})} f_{k_j}^I(p_q) = 0,
\]

so \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) satisfies (1). For each \( 1 \leq i \leq n \), we also have

\[
\frac{\partial f_{k_j}^I}{\partial z_i}(\zeta_q \ast p_q) = \zeta_q^{d(w; f_{k_j})-w_i} \frac{\partial f_{k_j}^I}{\partial z_i}(p_q),
\]

and since \( \zeta_q^{w_i} = 1 \) for all \( i \in I(w) \) and \( \zeta_q^{w_i} \) (which is non-zero) is independent of the index \( j \) \((1 \leq j \leq m) \) for all \( i \notin I(w) \), it follows that

\[
\sum_{j=1}^m \mu_{k_j,q} \frac{\partial f_{w}^{k_j}}{\partial z_i}(\zeta_q \ast p_q) = \begin{cases} 
   \lambda_q \bar{p}_{q,i} & \text{for } i \in I(w), \\
   0 & \text{for } i \notin I(w),
   \end{cases}
\]

so that the sequence \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) satisfies (2) with the complex numbers \( \mu_{k_j,q}/\zeta_q^{d(w; f_{k_j})} \) \((1 \leq j \leq m) \). Finally,

\[
\sum_{i \in I(w)} |(\zeta_q \ast p_q)_i|^2 = \sum_{i \in I(w)} |p_{q,i}|^2 \to 0
\]

as \( q \to \infty \), so \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) also satisfies (3). Altogether, \( \{\zeta_q \ast p_q\}_{q \in \mathbb{N}} \) satisfies the properties (1)–(3). Therefore, we can apply the Curve Selection Lemma to this situation in order to find a real analytic curve \( a(s) = (a_1(s), \ldots, a_n(s)) \) in \( \mathbb{C}^n \), \( 0 \leq s \leq 1 \), and a family of complex numbers \( \lambda(s) \), \( 0 < s \leq 1 \), such that:

1. \( f_{k_j}^I(a(s)) = \cdots = f_{k_m}^I(a(s)) = 0 \) for all \( s \neq 0; \)
Claim 3.5. There exists $b$ such that for all $N$ and $s$:

$$\sum_{j=1}^{m} \mu_{k_j}(s) \frac{\partial f_{w_i}^{k_j}}{\partial z_i}(a(s)) = \begin{cases} \lambda(s) \tilde{a}_i(s) & \text{if } i \in I(w), \\ 0 & \text{if } i \notin I(w); \end{cases}$$

(3') $a(0) = 0$ and $a(s) \in \mathbb{C}^n$ for $s \neq 0$.

For each $1 \leq i \leq n$, consider the Taylor expansion

$$a_i(s) = b_i s^{v_i} + \ldots,$$

where $b_i \in \mathbb{C}^*$ and $v_i \in \mathbb{N}^*$. Since the $v_i$'s are all positive, for each $1 \leq j \leq m$ the face $\Delta(v; f_{w_i}^{k_j})$ is a compact face of $\Delta(w; f_{w_i}^{k_j})$, and hence $\Delta(v; f_{w_i}^{k_j})$ is a face of $\Gamma(f_{w_i}^{k_j})$, where $v$ is the point of $\mathbb{N}^n$ whose $i$th coordinate is $v_i$. Also, note that for each $j$, we have $d(v; f_{w_i}^{k_j}) > 0$, and since

$$0 = f_{w_i}^{k_j}(a(s)) = (f_{w_i}^{k_j})_v(b) s^{d(v; f_{w_i}^{k_j})} + \ldots$$

for all $s \neq 0$, we also have $((f_{w_i}^{k_j})_v(b) = 0$, where $b$ is the point of $\mathbb{C}^n$ whose $i$th coordinate is $b_i$. (As usual, $(f_{w_i}^{k_j})_v$ is the face function of $f_{w_i}^{k_j}$ with respect to $v$.)

Write $\mu_{k_j}(s) = \mu_{k_j} s^{g_j} + \ldots$, where $\mu_{k_j} \neq 0$. If $\mu_{k_j}(s) \equiv 0$, then $g_j = \infty$. Let

$$\delta := \min\{d(v; f_{w_i}^{k_j}) + g_1, \ldots, d(v; f_{w_i}^{k_m}) + g_m\},$$

and put

$$\tilde{\mu}_{k_j} = \begin{cases} \mu_{k_j} & \text{if } d(v; f_{w_i}^{k_j}) + g_j = \delta, \\ 0 & \text{if } d(v; f_{w_i}^{k_j}) + g_j > \delta. \end{cases}$$

Claim 3.5. There exists $i_0 \in I(w)$ such that $\sum_{j=1}^{m} \tilde{\mu}_{k_j} \frac{\partial (f_{w_i}^{k_j})_v}{\partial z_i}(b) \neq 0$. (We recall that $\mu_{k_j}(s) \neq 0$ for at least an index $j$.)

Proof. First, observe that for all $1 \leq j \leq m$ and all $1 \leq i \leq n$:

$$\frac{\partial f_{w_i}^{k_j}}{\partial z_i}(a(s)) = \frac{\partial (f_{w_i}^{k_j})_v}{\partial z_i}(b) s^{d(v; f_{w_i}^{k_j})-v_i} + \ldots.$$  

Thus, if the assertion in Claim 3.5 fails, then the sum

$$\sum_{j=1}^{m} \tilde{\mu}_{k_j} \frac{\partial (f_{w_i}^{k_j})_v}{\partial z_i}(b)$$

vanishes for all $i \in I(w)$, and so, by (2'), it vanishes for all $1 \leq i \leq n$. In other words, if $k_{j_1}, \ldots, k_{j_p}$ are the elements of the set $\{k_1, \ldots, k_m\}$ for which $d(v; f_{w_i}^{k_{j_1}}) + g_{j_1} = \delta, 1 \leq \ell \leq p$, then the vectors

$$\left(\frac{\partial (f_{w_i}^{k_{j_1}})}{\partial z_1}(b), \ldots, \frac{\partial (f_{w_i}^{k_{j_1}})}{\partial z_n}(b)\right), \ldots, \left(\frac{\partial (f_{w_i}^{k_{j_p}})}{\partial z_1}(b), \ldots, \frac{\partial (f_{w_i}^{k_{j_p}})}{\partial z_n}(b)\right)$$

of $\mathbb{C}^n$ are linearly dependent, that is,

$$d(f_{w_i}^{k_{j_1}})(b) \wedge \ldots \wedge d(f_{w_i}^{k_{j_p}})(b) = 0.$$
As \((f^{k_j}_{w'})_v = f^{k_j}_{w' + vw}\) for any sufficiently large integer \(\nu \in \mathbb{N}\) (so that \((f^{k_j}_{w'})_v\) is the face function of \(f^{k_j}\) with respect to the weight vector \(v + \nu w\)) and \((f^{k_j}_{w'})_v(b) = 0\) for \(1 \leq \ell \leq p\), this contradicts the non-degeneracy of \(V(f^{k_1}, \ldots, f^{k_p})\) (see Assumptions 3.1).

Combined with (2′) again, Claim 3.5 implies that \(\lambda(s)\) is not constantly zero. Write it as a Laurent series \(\lambda(s) = \lambda_0 s^c + \cdots\), where \(\lambda_0 \neq 0\). Then, still from (2′), we deduce that for all \(1 \leq i \leq n\):

\[
\sum_{j=1}^{m} \tilde{\mu}_{kj} \frac{\partial (f^{k_j}_{w'})_v}{\partial z_i}(v, b) s^\delta + \cdots = \begin{cases} 
\lambda_0 b_i s^{c+2v_i} + \cdots & \text{if } i \in I(w), \\
0 & \text{if } i \notin I(w).
\end{cases}
\]  

(3.6)

Put \(S_i := \sum_{j=1}^{m} \tilde{\mu}_{kj} \frac{\partial (f^{k_j}_{w'})_v}{\partial z_i}(v, b)\), and define

\[
v_0 := \min \{v_i : i \in I(w)\} \quad \text{and} \quad I_0 := \{i \in I(w) : v_i = v_0\}.
\]  

(3.7)

Since the coefficient \(\lambda_0 b_i\) on the right-hand side of (3.6) is non-zero and the set of indexes \(i \in I(w)\) such that \(S_i \neq 0\) is not empty (see Claim 3.5), we have \(\delta = c + 2v_0\) and \(S_i \neq 0\) for any \(i \in I_0\). In fact, for any \(1 \leq i \leq n\), the following equality holds:

\[
S_i \equiv \sum_{j=1}^{m} \tilde{\mu}_{kj} \frac{\partial (f^{k_j}_{w'})_v}{\partial z_i}(v, b) = \begin{cases} 
\lambda_0 b_i & \text{if } i \in I_0, \\
0 & \text{if } i \notin I_0.
\end{cases}
\]  

(3.8)

Since \(I_0 \neq \emptyset\) and \((f^{k_j}_{w'})_v(b) = 0\) \((1 \leq j \leq m)\), combined with the Euler identity, the relation (3.8) implies

\[
0 = \sum_{j=1}^{m} \tilde{\mu}_{kj} \cdot d(v; f^{k_j}_{w'}) \cdot (f^{k_j}_{w'})_v(b) = \sum_{j=1}^{m} \tilde{\mu}_{kj} \left( \sum_{i=1}^{n} v_i b_i \frac{\partial (f^{k_j}_{w'})_v}{\partial z_i}(v, b) \right)
= \sum_{i \in I_0} v_i b_i \left( \sum_{j=1}^{m} \tilde{\mu}_{kj} \frac{\partial (f^{k_j}_{w'})_v}{\partial z_i}(v, b) \right) = \lambda_0 \cdot \sum_{i \in I_0} v_i |b_i|^2 \neq 0,
\]

which is a contradiction. This completes the proof of Lemma 3.2.

4. Uniformly Stable Family and Uniform Stable Radius

Now, let \(f^1(t, z), \ldots, f^{k_0}(t, z)\) be non-constant polynomial functions of \(n+1\) complex variables \((t, z) = (t, z_1, \ldots, z_n)\) such that \(f^k(t, 0) = 0\) for all \(t \in \mathbb{C}\) and all \(1 \leq k \leq k_0\). As usual, for any \(t \in \mathbb{C}\), we write \(f^k_t(z) := f^k(t, z)\).

**Assumptions 4.1.** Throughout this section, we suppose that for any sufficiently small \(t\) (say, \(|t| \leq \tau_0\) for some \(\tau_0 > 0\)), the following two conditions hold true:

1. for any \(1 \leq k \leq k_0\), the Newton boundary \(\Gamma(f^k_t)\) is independent of \(t\) (we may still have \(\Gamma(f^k_t) \neq \Gamma(f^{k'}_t)\) for \(k \neq k'\));
2. for any \(k_1, \ldots, k_m \in \{k_1, \ldots, k_0\}\), the germ at \(0\) of the variety \(V(f^{k_1}_t, \ldots, f^{k_m}_t)\) is the germ of a non-degenerate complete intersection variety.

Note that (1) implies that the set \(I(f^k_t)\) is independent of \(t\).
4.1. Statements of the results of Section 4. By Lemma 3.2 we know that under Assumptions 4.1 there exists \( \varepsilon_0 > 0 \) such that for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0\} \), any \( I \subseteq \{1, \ldots, n\} \) with \( I \in \mathcal{I}(f^{k_1}_{0, I}) \cap \cdots \cap \mathcal{I}(f^{k_m}_{0, I}) \), any weight vector \( \mathbf{w} \in \mathbb{N}^I \) and any \( \lambda \in \mathbb{C} \), if \( \mathbf{a} \in \mathbb{C}^I \) satisfies the conditions (1) and (2) of Lemma 3.2 for the functions \( f^{k_1}_{0, I}, \ldots, f^{k_m}_{0, I} \), then

\[
\mathbf{a} \notin \left\{ \mathbf{z} \in \mathbb{C}^* : \sum_{i \in I \cap I(\mathbf{w})} |z_i|^2 \leq \varepsilon_0^2 \right\}.
\]

(Here, \( f^{k, I}_{0, w} \) denotes the face function \( f^{k, I}_{0, w} \equiv (f^k_{0, I})_{\Delta(\mathbf{w}; f^k_{0, I})} \) of \( f^k_{0, I} \) with respect to \( \mathbf{w} \).)

Once for all, let us fix such a number \( \varepsilon_0 \). Then we have the following result which asserts that if \( t \) is small enough, then Lemma 3.2 also holds for the functions \( f^{k_1}_{t, I}, \ldots, f^{k_m}_{t, I} \) with the same number \( \varepsilon_0 \).

**Lemma 4.2.** Under Assumptions 4.1, there exists \( \tau \) with \( 0 < \tau \leq \tau_0 \) such that for any \( t \in \mathcal{D}_\tau := \{ \mathbf{t} \in \mathbb{C} : |t| \leq \tau \} \), any \( k_1, \ldots, k_m \in \{1, \ldots, k_0\} \), any \( I \subseteq \{1, \ldots, n\} \) with \( I \in \mathcal{I}(f^{k_1}_{t, I}) \cap \cdots \cap \mathcal{I}(f^{k_m}_{t, I}) \), any weight vector \( \mathbf{w} \in \mathbb{N}^I \) and any \( \lambda \in \mathbb{C} \), if \( \mathbf{a} = (a_1, \ldots, a_n) \in \mathbb{C}^I \) satisfies the conditions (1) and (2) of Lemma 3.2 for the functions \( f^{k_1}_{t, I}, \ldots, f^{k_m}_{t, I} \), that is, if:

1. \( f^{k_1}_{t, I}(\mathbf{a}) = \cdots = f^{k_m}_{t, I}(\mathbf{a}) = 0; \)
2. there exists a \( m \)-tuple \( (\mu_{k_1}, \ldots, \mu_{k_m}) \in \mathbb{C}^m \setminus \{0\} \) such that for all \( i \in I \):

\[
\sum_{j=1}^m \mu_{k_j} \frac{\partial f^{k_i}_{t, I}}{\partial z_i}(\mathbf{a}) = \begin{cases} \lambda \bar{a}_i & \text{if } i \in I \cap I(\mathbf{w}), \\ 0 & \text{if } i \in I \setminus I(\mathbf{w}), \end{cases}
\]

where again \( \bar{a}_i \) is the complex conjugate of \( a_i \) and \( I(\mathbf{w}) := \{ i \in \{1, \ldots, n\}; w_i = 0 \} \); then we must have

\[
\mathbf{a} \notin \left\{ \mathbf{z} \in \mathbb{C}^* : \sum_{i \in I \cap I(\mathbf{w})} |z_i|^2 \leq \varepsilon_0^2 \right\},
\]

where \( \varepsilon_0 \) is the number set above.

We shall prove Lemma 4.2 in §4.3. Note that it generalizes Lemma 3 of [9] (obtained by taking \( k_0 = 1 \)). Using Lemma 4.2 we shall prove the following second important theorem which recovers Theorem 2 of [9] (obtained for \( k_0 = 1 \)).

Put \( f(t, \mathbf{z}) := f^1(t, \mathbf{z}) \cdots f^{k_0}(t, \mathbf{z}) \), and as usual write \( f_t(\mathbf{z}) := f(t, \mathbf{z}) \).

**Theorem 4.3.** Under Assumptions 4.1, the family \( \{f_t\}_{t \in \mathcal{D}_\tau} \) is a uniformly stable family with uniform stable radius \( \varepsilon_0 \). (Here, \( \tau \) is the number that appears in Lemma 4.2 and \( \varepsilon_0 \) is the number that we have fixed just before the statement of this lemma.)

We recall that the family \( \{f_t\}_{t \in \mathcal{D}_\tau} \) is said to be uniformly stable with uniform stable radius \( \varepsilon_0 \) if for any \( 0 < \varepsilon_1 \leq \varepsilon_2 < \varepsilon_0 \), there exists \( \delta(\varepsilon_1, \varepsilon_2) > 0 \) such that for any \( \mathbf{z} \in \mathbb{C} \) with \( 0 < |\eta| \leq \delta(\varepsilon_1, \varepsilon_2) \), the hypersurface \( f^{-1}_t(\eta) \) is non-singular in \( B_{\varepsilon_0} := \{ \mathbf{z} \in \mathbb{C}^n \mid ||\mathbf{z}|| < \varepsilon_0 \} \) and transversely intersects the sphere \( S_{\varepsilon_12} := \{ \mathbf{z} \in \mathbb{C}^n \mid ||\mathbf{z}|| = \varepsilon_{12} \} \) for any \( \varepsilon_1 \leq \varepsilon_{12} \leq \varepsilon_2 \) and any \( t \in \mathcal{D}_\tau \).

We shall prove Theorem 4.3 in §4.2 but before giving the proof, let us state the first main theorem of this paper (Theorem 4.5 below). For that purpose, we first observe that Theorem 4.3 has the following corollary which generalizes Corollary 1 of [9] (obtained by taking \( k_0 = 1 \)).

**Corollary 4.4.** Under Assumptions 4.1 the family \( \{f_t\}_{t \in \mathcal{D}_\tau} \) is a uniformly stable family.
Proof. By Lemma 3.2, for any \( t_0 \in D_{\lambda_0} \), there exists \( \varepsilon(t_0) > 0 \) such that for any \( k_1, \ldots, k_m \in \{1, \ldots, k_0\} \), any \( I \subseteq \{1, \ldots, n\} \) with \( I \in \mathcal{I}(f_{t_0}^{k_1}) \cap \cdots \cap \mathcal{I}(f_{t_0}^{k_m}) \), any weight vector \( w \in \mathbb{N}^I \) and any \( \lambda \in \mathbb{C} \), if \( \mathbf{a} \in \mathbb{C}^I \) satisfies the conditions (1) and (2) of Lemma 3.2 for the functions \( f_{t,0}^{k_1,1}, \ldots, f_{t,0}^{k_m,1} \), then \( \mathbf{a} \) does not belong to the set

\[
\left\{ \mathbf{z} \in \mathbb{C}^I : \sum_{i \in I \cap I(w)} |z_i|^2 \leq \varepsilon(t_0)^2 \right\}.
\]  

(4.1)

Then, by (the corresponding version of) Lemma 4.3, there exists \( \tau(t_0) > 0 \) such that for any \( t \in D_{\tau(t_0)}(t_0) : = \{ t \in \mathbb{C} : |t - t_0| \leq \tau(t_0) \} \), any \( k_1, \ldots, k_m \in \{1, \ldots, k_0\} \), any \( I \subseteq \{1, \ldots, n\} \) with \( I \in \mathcal{I}(f_{t_0}^{k_1}) \cap \cdots \cap \mathcal{I}(f_{t_0}^{k_m}) \), any weight vector \( w \in \mathbb{N}^I \) and any \( \lambda \in \mathbb{C} \), if \( \mathbf{a} \in \mathbb{C}^I \) satisfies the conditions (1) and (2) of Lemma 3.2 for the functions \( f_{t,0}^{k_1,1}, \ldots, f_{t,0}^{k_m,1} \), then \( \mathbf{a} \) does not belong to the set (4.1). Now, applying (the corresponding version of) Theorem 3.3 shows that the family \( \{ f_t \}_{t \in D_{\tau(t_0)}} \) is a uniformly stable family with uniform stable radius \( \varepsilon(t_0) \). Corollary 4.4 then follows from the compactness of the disc \( D_{\lambda_0} \). \( \square \)

Now, by [9, Lemma 2], we know that if \( \{ f_t \}_{t \in D_{\lambda_0}} \) is a uniformly stable family—say, with uniform stable radius \( \varepsilon \)—then the Milnor fibrations of \( f_t \) and \( f_0 \) at \( 0 \) are isomorphic for all \( t \in D_{\lambda_0} \), that is, for all such \( t \)'s there exists a fibre-preserving diffeomorphism

\[
\tilde{B}_\varepsilon \cap f_t^{-1}\left(S_{\delta(\varepsilon, \frac{\lambda}{\varepsilon})}\right) \sim \tilde{B}_\varepsilon \cap f_0^{-1}\left(S_{\delta(\varepsilon, \frac{\lambda}{\varepsilon})}\right),
\]

where \( \delta(\varepsilon, \frac{\lambda}{\varepsilon}) \) is the number that appears in the definition of a “uniform stable family” given just after the statement of Theorem 4.3 and where \( S_{\delta(\varepsilon, \frac{\lambda}{\varepsilon})} := \{ z \in \mathbb{C} : |z| = \delta(\varepsilon, \frac{\lambda}{\varepsilon}) \} \). Combining this result with Corollary 4.4 gives our first main theorem, the statement of which is as follows. Again, the special case \( k_0 = 1 \) (for which the functions \( f_t \) are necessarily non-degenerate) is already contained in [9].

**Theorem 4.5.** Under Assumptions 4.1, the Milnor fibrations of \( f_t \) and \( f_0 \) at \( 0 \) are isomorphic for all \( t \in D_{\lambda_0} \).

The following two subsections (§4.2 and §4.3) are devoted to the proofs of Theorem 4.3 and Lemma 4.2 respectively.

**4.2. Proof of Theorem 4.3** It is along the same lines as the proof of Theorem 3.3. We start with the following claim which plays a role similar to that of [6, Corollary 2.8] in the proof of Theorem 3.3.

**Claim 4.6.** There exists \( \delta > 0 \) such that for any \( \eta \in \mathbb{C} \) with \( 0 < |\eta| \leq \delta \), the hypersurface \( f_t^{-1}(\eta) \) is non-singular in \( \tilde{B}_{\varepsilon_0} \) for any \( t \in D_{\tau} \). (Of course, we work under Assumptions 4.1.)

We postpone the proof of this claim at the end of §4.2 and we first complete the proof of Theorem 4.3. We argue by contradiction. By Claim 4.6, if the assertion in Theorem 4.3 is false, then it follows from the Curve Selection Lemma that there exists a real analytic curve \( (t(s), z(s)) = (t(s), z_1(s), \ldots, z_n(s)) \) in \( D_{\tau} \times \tilde{B}_{\varepsilon_0}, 0 \leq s \leq 1 \), and a family of complex numbers \( \lambda(s), 0 < s \leq 1 \), such that the following three condition holds:

(i) \( \frac{\partial f_t(s)}{\partial z_i}(\lambda(s)) = \lambda(s) \bar{z}_i(s) \) for \( 1 \leq i \leq n \) and \( s \neq 0 \);

(ii) \( f_t(0)(z(0)) = 0 \) but \( f_t(s)(z(s)) \neq 0 \) for \( s \neq 0 \);

(iii) there exists \( \varepsilon > 0 \) such that \( \varepsilon \leq \| z(s) \| \leq \varepsilon_0 \).
By (i) and (ii), \( \lambda(s) \neq 0 \), and we can express it as a Laurent series
\[
\lambda(s) = \lambda_0 s^c + \cdots ,
\]
where \( \lambda_0 \in \mathbb{C}^* \). Let \( I := \{ i ; z_i(s) \neq 0 \} \). By (ii), \( I \in \mathcal{I}(f_{t(s)}) \), and hence \( I \in \mathcal{I}(f_{t(s)}^1) \cap \cdots \cap \mathcal{I}(f_{t(s)}^{k_0}) \). For each \( i \in I \), consider the Taylor expansion
\[
z_i(s) = a_i s^{w_i} + \cdots ,
\]
where \( a_i \in \mathbb{C}^* \) and \( w_i \in \mathbb{N} \). The following is the counterpart of Claim 3.4.

**Claim 4.7.** There exists \( 1 \leq k \leq k_0 \) such that \( f_{t(s)}^{k,I}(a) = 0 \), where again \( a \) and \( w \) are the points in \( \mathbb{C}^I \) and \( \mathbb{N}^I \), respectively, whose \( i \)th coordinates \((i \in I)\) are \( a_i \) and \( w_i \) respectively.

Again, we shall prove this claim later. First, we complete the proof of the theorem. Once more, hereafter, to simplify the notation, we shall assume that \( I = \{ 1, \ldots, n \} \), so that the function \( f_{t(s)}^{k,I} \) is simply written as \( f_k^{I} \), the intersection \( I \cap I(w) \) is written as \( I(w) \) (where, as in Lemma 4.2, \( I(w) \) is the set of all indexes \( i \in \{ 1, \ldots, n \} \) for which \( w_i = 0 \)), and so on.

Look at the set consisting of all integers \( k \) for which \( f_{t(s)}^{k,I}(a) = 0 \). By Claim 4.7, this set is not empty. As in the proof of Theorem 3.3, we assume that \( f_{t(s)}^{k,I}(a) \) vanishes for \( 1 \leq k \leq k_0' \) and does not vanish for \( k_0' + 1 \leq k \leq k_0 \), and we write \( f = f_1^{I} \cdots f_{k_0'}^{I} \cdot h \) where \( h := f_{k_0'}^{I+1} \cdots f_{k_0}^{I} \) if \( k_0' \leq k_0 - 1 \) and \( h := 1 \) if \( k_0' = k_0 \); finally, for each \( 1 \leq k \leq k_0' \), we put
\[
e_k := d(w; f_{t(s)}^{k,I}(a)) - \sum_{\ell = 1}^{k_0'} \text{ord}_s f_{t(s)}^{\ell,I}(z(s)) = \sum_{\ell = 1}^{k_0'} \text{ord}_s f_{t(s)}^{\ell,I}(z(s))
\]
(where, as usual, \( \text{ord}_s f_{t(s)}^{\ell,I}(z(s)) \) means the order, in \( s \), of the expression \( f_{t(s)}^{\ell,I}(z(s)) \equiv f(t(s), z(s)) \))

and we suppose that
\[
\epsilon_{\text{min}} := \epsilon_1 = \cdots = \epsilon_{k_0'} < \epsilon_{k_0'} + 1 \leq \cdots \leq \epsilon_{k_0'}.
\]

Note that the equality \( \Gamma_+(f_{t(s)}^{k,I}) = \Gamma_+(f_{t(s)}^{k_0,I}) \) implies \( \Delta(w; f_{t(s)}^{k,I}) = \Delta(w; f_{t(s)}^{k_0,I}) \) and \( d(w; f_{t(s)}^{k,I}) = d(w; f_{t(s)}^{k_0,I}) = d(w; f_{t(s)}^{k_0,I}) = d(w; f_{t(s)}^{k_0,I}) \) for all \( s \), where \( w = (w_0, w) \) with \( w_0 \) defined by the Taylor expansion \( t(s) := t_0 s^{w_0} + \cdots , t_0 \neq 0 \). Still as in the proof of Theorem 3.3 (see (3.1) – (3.3)), it follows from the relation (i) that there exist non-zero complex numbers \( \mu_1, \ldots, \mu_{k_0} \) such that for any \( 1 \leq i \leq n \):
\[
\sum_{k = 1}^{k_0'} \frac{\partial f_{t(s)}^{k,I}(a)}{\partial z_i} \cdot \mu_k \cdot s^{d(w;h)} + \epsilon_{\text{min}} + \cdots + \lambda_0 \bar{a}_i s^{c+2w_i} + \cdots
\]

and since \( \lambda_0 \bar{a}_i \neq 0 \) and \( I(w) \neq \emptyset \) (by (iii)), by the same argument as the one given after (4.4), we deduce that the sum
\[
S_i := \sum_{k = 1}^{k_0'} \mu_k \frac{\partial f_{t(s)}^{k,I}(a)}{\partial z_i}(a)
\]
vanishes for all \( i \notin I(w) \). If it also vanishes for all \( i \in I(w) \), then we get a contradiction with Lemma 1.2 because \( z(s) \in B_{t_0} \), and hence,
\[
(4.2) \quad \sum_{i \in I(w)} |a_i|^2 = \| z(0) \|^2 \leq \epsilon_{0}^2.
\]
If there is an index \( i_0 \in I(w) \) such that \( S_{i_0} \neq 0 \), then

\[
S_i = \sum_{k=1}^{k_0} \mu_k \frac{\partial f_{t(0),w}(a)}{\partial z_i} = \begin{cases} 
\lambda_0 \bar{a}_i & \text{for } i \in I(w), \\
0 & \text{for } i \notin I(w),
\end{cases}
\]

and still by (4.2), we get a new contradiction with Lemma 4.2.

To complete the proof of Theorem 4.3 it remains to prove Claims 4.6 and 4.7. We start with the proof of Claim 4.7.

**Proof of Claim 4.7** It is similar to the proof of Claim 3.4. Again, we assume \( I = \{1, \ldots, n\} \), so that \( f_{t(0),w} = f_{t(0),w}^k \). We argue by contradiction. Suppose that \( f_{t(0),w}(a) \neq 0 \) for all \( 1 \leq k \leq k_0 \). Then \( f_{t(0),w}(a) = f_{t(0),w}^k(a) \neq 0 \) and \( d(w; f_{t(0)}^k) = d(w; f^k) = \text{ord} f_{t(s)}^k(z(s)) \) for all \( 1 \leq k \leq k_0 \) (where \( w \) and \( t_0 \) are defined as above), and by (ii), there exists \( 1 \leq k_1 \leq k_0 \) such that \( f_{t(0)}(z(0)) = 0 \). If \( I(w) = \{1, \ldots, n\} \), then \( d(w; f_{t(0)}^{k_1}) = 0 \) and

\[
f_{t(s)}^k(z(s)) = f_{t(0),w}^k(a) s^0 + \cdots,
\]

so that \( 0 = f_{t(0)}^k(z(0)) = f_{t(0),w}^k(a) \), which is a contradiction. If \( I(w) \) is a proper subset of \( \{1, \ldots, n\} \) and \( d(w; f_{t(0)}^k) \neq 0 \), then, exactly as in the proof of Claim 3.4 if \( e := \sum_{k=1}^{k_0} \text{ord} f_{t(s)}^k(z(s)) \), then for any \( 1 \leq i \leq n \):

\[
\sum_{k=1}^{k_0} \left( \prod_{1 \leq \ell \leq k_0, \ell \neq k} f_{t(0),w}^\ell(a) \right) \cdot \frac{\partial f_{t(0),w}^k(a)}{\partial z_i} = \lambda_0 \bar{a}_i s^{e+2w_i + \cdots}.
\]

As above, since \( \lambda_0 \bar{a}_i \neq 0 \) and \( I(w) \neq \emptyset \), this implies that the sum

\[
\sum_{k=1}^{k_0} \left( \prod_{1 \leq \ell \leq k_0, \ell \neq k} f_{t(0),w}^\ell(a) \right) \cdot \frac{\partial f_{t(0),w}^k(a)}{\partial z_i}
\]

vanishes for all \( i \notin I(w) \), and using the Euler identity, we get exactly the same contradiction as in the proof of Claim 3.4. \( \square \)

Now we prove Claim 4.6.

**Proof of Claim 4.6** The argument is very similar to that given in the proof of Theorem 4.3. We argue by contradiction. If the assertion in the claim is false, then, by the Curve Selection Lemma, there exists a real analytic curve \( (t(s), z(s)) = (t(s), z_1(s), \ldots, z_n(s)) \) in \( D_\tau \times B_{\varepsilon_0} \), \( 0 \leq s \leq 1 \), such that the following two conditions hold:

1. \( \frac{\partial f_{t(s)}(z(s))}{\partial z_i} = 0 \) for \( 1 \leq i \leq n \);
2. \( f_{t(s)}(z(s)) = 0 \) but \( f_{t(s)}(z(s)) \neq 0 \) for \( s \neq 0 \);

Let \( I := \{i; z_i(s) \neq 0\} \). By (ii), \( I \in \mathcal{I}(f_{t(s)}^1) \cap \cdots \cap \mathcal{I}(f_{t(s)}^{k_0}) \). For each \( i \in I \), consider the Taylor expansion

\[
z_i(s) = a_is^{w_i} + \cdots,
\]

where \( a_i \in \mathbb{C}^* \) and \( w_i \in \mathbb{N} \).

**Claim 4.8.** There exists \( 1 \leq k \leq k_0 \) such that \( f_{t(0),w}(a) = 0 \), where again \( a \) and \( w \) are the points in \( \mathbb{C}^I \) and \( \mathbb{N}^I \), respectively, whose \( i \)th coordinates \( (i \in I) \) are \( a_i \) and \( w_i \) respectively.
The proof of Claim 4.8 is completely similar to that of Claim 4.7. The only difference is that the right-hand side of the equality (4.3) is now zero. However this does not change anything in the argument.

Once more, we assume \( I = \{1, \ldots, n\} \), so that \( f^I_{t(0), w} = f^I_{t(0), w(0)} \), and we look at the set consisting of all integers \( k \) for which \( f^k_{t(0), w(0)}(a) = 0 \). By Claim 4.8, this set is not empty. As in the proofs of Theorems 3.3 or 4.3, we assume that \( f^k_{t(0), w(0)}(a) \) vanishes for \( 1 \leq k \leq k'_0 \) and does not vanish for \( k'_0 + 1 \leq k \leq k_0 \), and we write \( f = f^{k_0+1} \cdots f^k \cdot h \) where \( h := f^{k_0 + 1} \cdots f^k \) if \( k'_0 \leq k_0 - 1 \) and \( h := 1 \) if \( k'_0 = k_0 \); finally, for each \( 1 \leq k \leq k'_0 \), we put

\[
e_k := d(w; f^k_{t(0)}) - \operatorname{ord} f^k_{t(s)}(z(s)) + \sum_{\ell=1}^{k'_0} \operatorname{ord} f^\ell_{t(s)}(z(s)),
\]

and we suppose that

\[
e_{\min} := e_1 = \cdots = e_{k'_0} < e_{k'_0+1} \leq \cdots \leq e_{k_0}.
\]

Still as in the proofs of Theorems 3.3 or 4.3, it follows from the relation (i) that there exist non-zero complex numbers \( \mu_1, \ldots, \mu_{k'_0} \) such that for any \( 1 \leq i \leq n \):

\[
\sum_{k=1}^{k'_0} \frac{\partial f^k_{t(0), w(0)}}{\partial z_i}(a) \cdot \mu_k \cdot s^d(w; h) + e_{\min} + \cdots = 0,
\]

and hence

\[
\sum_{k=1}^{k'_0} \mu_k \frac{\partial f^k_{t(0), w(0)}}{\partial z_i}(a) = 0.
\]

In other words, the vectors

\[
\left( \frac{\partial f^1_{t(0), w(0)}}{\partial z_1}(a), \ldots, \frac{\partial f^1_{t(0), w(0)}}{\partial z_n}(a) \right), \ldots, \left( \frac{\partial f^{k'_0}_{t(0), w(0)}}{\partial z_1}(a), \ldots, \frac{\partial f^{k'_0}_{t(0), w(0)}}{\partial z_n}(a) \right)
\]

of \( \mathbb{C}^n \) are linearly dependent, that is,

\[
df^1_{t(0), w(0)}(a) \wedge \cdots \wedge df^{k'_0}_{t(0), w(0)}(a) = 0,
\]

which contradicts the non-degeneracy of \( V(f^{k'_0}_{t(0)}, \ldots, f^1_{t(0)}) \) if \( I(w) = \emptyset \). In the case where \( I(w) \neq \emptyset \), we cannot proceed like that. However, in this case, Lemma 4.2 (applied with \( \lambda = 0 \)) implies

\[
a \notin \left\{ z \in \mathbb{C}^n : \sum_{i \in I(w)} |z_i|^2 \leq \varepsilon_0^2 \right\},
\]

and since \( z(s) \in \hat{B}_{\varepsilon_0} \), we also have

\[
\sum_{i \in I(w)} |a_i|^2 \leq \sum_{i=1}^n |z_i(0)|^2 = \|z(0)\|^2 < \varepsilon_0^2,
\]

which is a contradiction. \( \square \)

4.3. Proof of Lemma 4.2. If the assertion of this lemma fails for some \( k_1, \ldots, k_m, I \) and \( \Delta(w; f^{k_1}_{0}), \ldots, \Delta(w; f^{k_m}_{0}) \) such that \( I \cap I(w) = \emptyset \), then, as in the proof of Lemma 3.2, we get a contradiction with the non-degeneracy condition (see Assumptions 4.1 and Remark 2.3).

Now, assume that the assertion fails for some \( k_1, \ldots, k_m, I \) and \( \Delta(w; f^{k_1}_{0}), \ldots, \Delta(w; f^{k_m}_{0}) \) such that \( I \cap I(w) \neq \emptyset \). Again, without loss of generality, and in order to simplify the notation, we assume that \( I = \{1, \ldots, n\} \), so that \( f^I_{t,w} = f^I_{t, w(0)} \cap I(w) = I(w) \cap I(w) = I(w) \), \( \mathbb{C}^I = \mathbb{C}^n \),
etc. Then there exist sequences \( \{p_q\}_{q \in \mathbb{N}} \), \( \{\lambda_q\}_{q \in \mathbb{N}} \) and \( \{t_q\}_{q \in \mathbb{N}} \) of points in \( \mathbb{C}^n \), \( \mathbb{C} \) and \( \mathbb{C}^* \), respectively, such that:

1. \( f_{t_q, w}^{k_j}(p_q) = \cdots = f_{t_q, w}^{k_m}(p_q) = 0 \) for all \( q \in \mathbb{N} \);
2. there exists a sequence \( \{\mu_{k_1, q}, \ldots, \mu_{k_m, q}\}_{q \in \mathbb{N}} \) of points in \( \mathbb{C}^m \setminus \{0\} \) such that for all \( q \in \mathbb{N} \) and all \( 1 \leq i \leq n \):

\[
\sum_{j=1}^{m} \mu_{k_j, q} \frac{\partial f_{t_q, w}^{k_j}}{\partial z_i}(p_q) = \begin{cases} \lambda_q p_{q, i} & \text{if } i \in I(w), \\ 0 & \text{if } i \notin I(w), \end{cases}
\]

where, for each \( 1 \leq i \leq n \), \( p_{q, i} \) denotes the conjugate of the \( i \)th coordinate \( p_{q, i} \) of \( p_q \);
3. \( \sum_{i \in I(w)} |p_{q, i}|^2 \leq \varepsilon_q^2 \) and \( t_q \to 0 \) as \( q \to \infty \).

(Again, \( f_{t_q, w}^{k_j} \) denotes the face function \( f_{t_q}^{k_j} = (f_{t_q}^{k_j})_w = (f_{t_q}^{k_j})_{\Delta(w; f_{t_q}^{k_j})} \) of \( f_{t_q}^{k_j} \) with respect to \( w \).) By an argument similar to that used in the proof of Lemma 3.2, we can assume that the sequences \( \{p_{q, i}\}_{q \in \mathbb{N}} \) converge to 0 for all \( i \notin I(w) \), so that, once again, we can apply the Curve Selection Lemma to get a real analytic curve \( (t(s), a(s)) = (t(s), a_1(s), \ldots, a_n(s)) \) in \( \mathbb{C} \times \mathbb{C}^n \), \( 0 \leq s \leq 1 \), and a family of complex numbers \( \lambda(s), 0 < s < 1 \), such that:

1. (1') \( f_{t(s), w}^{k_j}(a(s)) = \cdots = f_{t(s), w}^{k_m}(a(s)) = 0 \) for all \( s \neq 0 \);
2. (2') there exists a real analytic curve \( \{\mu_{k_1}(s), \ldots, \mu_{k_n}(s)\} \) in \( \mathbb{C}^m \setminus \{0\} \), \( 0 < s < 1 \), such that for all \( s \neq 0 \) and all \( 1 \leq i \leq n \):

\[
\sum_{j=1}^{m} \mu_{k_j}(s) \frac{\partial f_{t(s), w}^{k_j}}{\partial z_i}(a(s)) = \begin{cases} \lambda(s) \bar{a}_i(s) & \text{if } i \in I(w), \\ 0 & \text{if } i \notin I(w), \end{cases}
\]

(3') \( \sum_{i \in I(w)} |a_i(s)|^2 \leq \varepsilon_0^2 \) and \( t(0) = 0, a_i(0) = 0 \) for \( i \notin I(w) \), and \( a(s) \in \mathbb{C}^n \) for \( s \neq 0 \).

For each \( 1 \leq i \leq n \), consider the Taylor expansion

\[ a_i(s) = b_i s^{v_i} + \ldots, \]

where \( b_i \in \mathbb{C}^* \) and \( v_i \in \mathbb{N} \), and put \( v_{\min} := \min\{v_1, \ldots, v_n\} \). Then we divide the proof into two cases depending on whether \( v_{\min} = 0 \) or \( v_{\min} > 0 \). Let us first assume \( v_{\min} > 0 \). In this case, the proof is similar to that of Lemma 3.2. Indeed, exactly as in this proof, for each \( 1 \leq j \leq m \) the face \( \Delta(v; f_{t}^{k_j}) \) is a (compact) face of \( \Gamma(f_{0, w}^{k_j}) \) and \( d(v; f_{t}^{k_j}) > 0 \). Since \( \Gamma_{\pm}(f_{t}^{k_j}) \) and hence \( \Delta(w; f_{t}^{k_j}) \) is independent of \( t \), we have

\[ 0 = f_{t(s), w}^{k_j}(a(s)) = f_{0, w, v}^{k_j}(b) \cdot s d(v; f_{0, w}^{k_j}) + \ldots \]

for all \( s \neq 0 \), and hence \( f_{0, w, v}^{k_j}(b) = 0 \), where \( v \) and \( b \) are the points of \( \mathbb{N}^n \) and \( \mathbb{C}^n \), respectively, whose \( i \)th coordinates are \( v_i \) and \( b_i \) respectively. Here, according to our notation, by \( f_{0, w, v}^{k_j} \) we mean the face function \( (f_{0, w}^{k_j})_v \) of \( f_{0, w}^{k_j} \) with respect to \( v \).

Write \( \mu_{k_j}(s) = \mu_{k_j} s^{v_j} + \cdots \), where \( \mu_{k_j} \neq 0 \). Again, if \( \mu_{k_j}(s) \equiv 0 \), then \( g_j = \infty \). Put

\[ \delta := \min\{d(v; f_{0, w}^{k_j}) + g_1, \ldots, d(v; f_{0, w}^{k_j}) + g_n\}, \]

and define \( \tilde{\mu}_{k_j} \) to be equal to \( \mu_{k_j} \) or 0 depending on whether \( d(v; f_{0, w}^{k_j}) + g_j \) is equal to \( \delta \) or not respectively.

**Claim 4.9.** There exists \( i_0 \in I(w) \) such that \( \sum_{j=1}^{m} \tilde{\mu}_{k_j} \frac{\partial f_{0, w, v}^{k_j}}{\partial z_{i_0}}(b) \neq 0 \).
Proof. It is along the same lines as the proof of Claim 3.5. More precisely, since $\Gamma_+(f^*_t)$ is independent of $t$, we have
\[ \frac{\partial f^k_j(s,w)(a(s))}{\partial z_i} = \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i} s^d(v,f^k_j) - v_i + \cdots \]
for all $1 \leq j \leq m$ and all $1 \leq i \leq n$. Thus, if the assertion in Claim 4.9 fails, then the sum
\[ \sum_{j=1}^m \tilde{\mu}_{kj} \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}(b) \]
vanishes for all $i \in I(w)$, and so, by (2'), it vanishes for all $1 \leq i \leq n$. As in the proof of Claim 3.5, this implies that
\[ df^k_j(0,w,v)(b) \wedge \cdots \wedge df^k_j(0,w,v)(b) = 0, \]
where the $k_{ij}$'s ($1 \leq i \leq p$) are the elements of $\{e_1, \ldots, e_m\}$ for which $d(v,f^k_j) + g_{ij} = \delta$.

Since $f^k_j(0,w,v) = f^k_j(0,v+v\omega)$ for any sufficiently large integer $\nu \in \mathbb{N}$ (so that $f^k_j(0,w,v)$ is the face function of $f^k_j$ with respect to the weight vector $v + \nu w$) and $f^k_j(0,w,v)(b) = 0$ for $1 \leq \ell \leq p$, and since $v_i + \nu w_i > 0$ for all $1 \leq i \leq n$, this contradicts the non-degeneracy of $V(f^k_j, \ldots, f^k_j)$ (see Assumptions 4.1).

Combined with (2') again, Claim 4.9 implies that $\lambda(s)$ is not constantly zero. Write it as a Laurent series $\lambda(s) = \lambda_0 s^c + \cdots$, where $\lambda_0 \neq 0$. Then, still from (2'), we deduce that for all $1 \leq i \leq n$:
\[ \sum_{j=1}^m \tilde{\mu}_{kj} \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i} s^d + \cdots = \begin{cases} \lambda_0 b_i s^{c+2\nu_i} + \cdots & \text{if } i \in I(w), \\
0 & \text{if } i \notin I(w). \end{cases} \]

Now, put $S_i := \sum_{j=1}^m \tilde{\mu}_{kj} \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}$ and define $v_0 \in \mathbb{N}$ and $I_0 \subseteq \{1, \ldots, n\}$ as in (5.7), that is, $v_0 := \min\{v_i : i \in I(w)\}$ and $I_0 := \{i \in I(w) : v_i = v_0\}$ (note that, in general, $v_0 \geq v_{\min}$). Then, as in the proof of Lemma 3.2, since $\lambda_0 b_i \neq 0$ and the set $\{i \in I(w) : S_i \neq 0\}$ is not empty (see Claim 4.9), we have $\delta = c + 2\nu_0$ and $S_i \neq 0$ for any $i \in I_0$. In fact, for any $1 \leq i \leq n$, the following holds:
\[ S_i \equiv \sum_{j=1}^m \tilde{\mu}_{kj} \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}(b) = \begin{cases} \lambda_0 b_i & \text{if } i \in I_0, \\
0 & \text{if } i \notin I_0. \end{cases} \]

Since $I_0 \neq \emptyset$ and $\frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}(b) = 0$ ($1 \leq j \leq m$), the relation (4.4) together with the Euler identity imply
\[ 0 = \sum_{j=1}^m \tilde{\mu}_{kj} \cdot d(v,f^k_j) \cdot \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i} = \sum_{j=1}^m \tilde{\mu}_{kj} \left( \sum_{i=1}^n v_i b_i \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}(b) \right) \]
\[ \sum_{i \in I_0} v_i b_i \left( \sum_{j=1}^m \tilde{\mu}_{kj} \frac{\partial f^k_j(0,w,v)(b)}{\partial z_i}(b) \right) = \lambda_0 \cdot \sum_{i \in I_0} v_i |b_i|^2 \neq 0, \]
which is a contradiction. This completes the proof of Lemma 4.2 in the case $v_{\min} > 0$.

Let us now assume $v_{\min} = 0$. Clearly, we still have $f^k_j(0,w,v)(b) = 0$ for $1 \leq j \leq m$. 

Claim 4.10. Even when $v_{\min} = 0$, there exists $i_0 \in I(w)$ such that $\sum_{j=1}^m \mu_{k_j} \frac{\partial f_{0,w,v}^{k_j}}{\partial z_i}(b) \neq 0$.

Proof. When $v_{\min} = 0$, the argument given in the proof of Claim 4.9 does not apply. In fact, in this case, Claim 4.10 directly follows from Lemma 3.2 and our choice of $\varepsilon_0$. More precisely, we know that $b \in \mathbb{C}^n$, $f_{0,w,v}^{k_j}(b) = 0$ (1 \leq j \leq m) and $f_{0,w,v}^{k_j} = f_{0,v+\nu w}^{k_j}$ for $\nu \in \mathbb{N}$ large enough. Therefore, arguing by contradiction, if

$$\sum_{j=1}^m \mu_{k_j} \frac{\partial f_{0,w,v}^{k_j}}{\partial z_i}(b) = 0$$

for all $i \in I(w)$ (and hence, by (2'), for all 1 \leq i \leq n), then Lemma 3.2 and our choice of $\varepsilon_0$ show that

$b \notin \left\{ z \in \mathbb{C}^n; \sum_{i \in I(v+\nu w)} |z_i|^2 \leq \varepsilon_0^2 \right\}$.

However, since $I(v+\nu w) \subseteq I(v)$, we have

$$\sum_{i \in I(v+\nu w)} |b_i|^2 \leq \sum_{i \in I(v)} |b_i|^2 = \sum_{i \in I(v)} |a_i(0)|^2 \leq \sum_{i \in I(w)} |a_i(0)|^2 + \sum_{i \in I(w)^c} |a_i(0)|^2 \leq \varepsilon_0^2,$$

which is a contradiction. (Here, $I(w)^c := \{1, \ldots, n\} \setminus I(w)$.) \hfill \Box

5. The “non-family” case

In the previous section, we have studied the case of families of functions. Hereafter, we investigate the “non-family” case. For that purpose, we consider $2k_0$ non-constant polynomial functions $f^1(z), \ldots, f^{k_0}(z)$ and $g^1(z), \ldots, g^{k_0}(z)$, each of them in $n$ complex variables $z = (z_1, \ldots, z_n)$, and as usual we assume $f^k(0) = g^k(0) = 0$ for all $1 \leq k \leq k_0$.

Assumptions 5.1. Throughout this section, we suppose that the following two conditions hold true:

1. For any $1 \leq k \leq k_0$, the Newton boundaries $\Gamma(f^k)$ and $\Gamma(g^k)$ coincide;
2. For any $k_1, \ldots, k_m \in \{k_1, \ldots, k_0\}$, the germs at 0 of the varieties $V(f^{k_1}, \ldots, f^{k_m})$ and $V(g^{k_1}, \ldots, g^{k_m})$ are the germs of non-degenerate complete intersection varieties.

Put $f(z) := f^1(z) \ldots f^{k_0}(z)$ and $g(z) := g^1(z) \ldots g^{k_0}(z)$. The second main theorem of this paper is stated as follows. Once more, note that when $k_0 = 1$, the functions $f$ and $g$ are non-degenerate, and then we recover Theorem 3 of [9].

Theorem 5.2. Under Assumptions 5.1, the Milnor fibrations of $f$ and $g$ at 0 are isomorphic.

Proof. For any $1 \leq k \leq k_0$ and any $t \in D_1 := \{ t \in \mathbb{C}; |t| \leq 1 \}$, we consider the polynomial functions

$f^k_t(z) := (1-t)f^k + tF^k$ and $g^k_t(z) := (1-t)g^k + tG^k$. 

be the points defined by
\[ F^k(z) := \sum_{\alpha \in \Gamma(f^k)} c_{\alpha} z^\alpha \quad \text{and} \quad G^k(z) := \sum_{\alpha \in \Gamma(g^k)} c'_{\alpha} z^\alpha \]
are the Newton principal parts of
\[ f^k(z) := \sum_{\alpha \in \mathbb{N}^n} c_{\alpha} z^\alpha \quad \text{and} \quad g^k(z) := \sum_{\alpha \in \mathbb{N}^n} c'_{\alpha} z^\alpha \]
respectively.

**Claim 5.3.** The Milnor fibrations of \( f^1 \cdots f^{k_0} \) and \( F^1 \cdots F^{k_0} \) (respectively, of \( g^1 \cdots g^{k_0} \) and \( G^1 \cdots G^{k_0} \)) at \( 0 \) are isomorphic.

**Proof.** First, observe that for any \( 1 \leq k \leq k_0 \) and any positive weight vector \( w \), we have
\[ f^k_{t,w}(z) := ((1-t)f^k + tF^k)_w = (1-t)f^k_w + tF^k_w = f^k_w. \]
From this observation and Assumptions\[5.1\] we deduce that \( V(f^1, \ldots, f^{k_m}) \) is a non-degenerate complete intersection variety for any \( t \in D_1 \), and since \( \Gamma(f^k) = \Gamma(f^k) \), it follows from Theorem 4.8 that the functions \( f_t(z) := f^1_t(z) \cdots f^{k_m}_t(z) \) and \( f_0(z) := f^1_0(z) \cdots f^{k_0}_0(z) = f^1(z) \cdots f^{k_0}(z) \) have isomorphic Milnor fibrations for any \( t \in D_1 \). In particular, taking \( t = 1 \) gives that \( F^1 \cdots F^{k_0} \) and \( f^1 \cdots f^{k_0} \) have isomorphic Milnor fibrations as announced. \( \square \)

**Claim 5.4.** The Milnor fibrations of \( F^1 \cdots F^{k_0} \) and \( G^1 \cdots G^{k_0} \) at \( 0 \) are isomorphic.

The proof of this claim is given below. Of course, Theorem 5.2 follows from Claims 5.3 and 5.4. \( \square \)

Now, let us prove Claim 5.4.

**Proof of Claim 5.4.** For each \( 1 \leq k \leq k_0 \), let \( \nu_{k,1}, \ldots, \nu_{k,n_k} \) be the integral points of \( \Gamma(f^k) = \Gamma(F^k) \), and for any \( c_k = (c_{k,1}, \ldots, c_{k,n_k}) \in \mathbb{C}^{n_k} \) put
\[ h^k_{c_k}(z) := \sum_{j=1}^{n_k} c_{k,j} z^{\nu_{k,j}}. \]
Now, consider the set \( U \) of points \( (c_1, \ldots, c_{k_0}) \) in \( \mathbb{C}^{n_1} \times \cdots \times \mathbb{C}^{n_{k_0}} \) such that:
1. \( \Gamma(h^k_{c_k}) = \Gamma(f^k) \) for any \( 1 \leq k \leq k_0 \);
2. For any \( 1 \leq k_1, \ldots, k_m \leq k_0 \), the variety \( V(h^k_{c_{k_1}}, \ldots, h^k_{c_{k_m}}) \) is a non-degenerate complete intersection variety.

**Claim 5.5.** The set \( U \) is a Zariski open subset of \( \mathbb{C}^{n_1} \times \cdots \times \mathbb{C}^{n_{k_0}} \); in particular, it is path-connected.

The special case \( k_0 = 1 \) in Claim 5.5 is treated in the appendix of [7]. Before proving this claim in the general case, we complete the proof of Claim 5.4.

For each \( 1 \leq k \leq k_0 \), let
\[ c_k(F^k) := (c_{k,1}(F^k), \ldots, c_{k,n_k}(F^k)) \quad \text{and} \quad c_k(G^k) := (c_{k,1}(G^k), \ldots, c_{k,n_k}(G^k)) \]
be the points defined by
\[ F^k(z) := h^k_{c_k(F^k)}(z) := \sum_{j=1}^{n_k} c_{k,j}(F^k) z^{\nu_{k,j}} \quad \text{and} \quad G^k(z) := h^k_{c_k(G^k)}(z) := \sum_{j=1}^{n_k} c_{k,j}(G^k) z^{\nu_{k,j}}. \]
By Claim 5.3, we can choose a finite sequence of (say, \( p_0 \)) \( k_0 \)-tuples
\[ (c_1(1), \ldots, c_{k_0}(1)), \ldots, (c_1(p_0), \ldots, c_{k_0}(p_0)) \]
in $U$, starting at $(c_1(F^1), \ldots, c_{k_0}(F^{k_0}))$ and ending at $(c_1(G^1), \ldots, c_{k_0}(G^{k_0}))$, such that for each $1 \leq p \leq p_0 - 1$, the straight-line segment

$$\ell_p(t) := (1 - t)\{c(p), \ldots, c_{p_0}(p)\} + t\{c(p + 1), \ldots, c_{k_0}(p + 1)\}$$

$(1 \leq t \leq 1)$ is contained in $U$. For each $1 \leq p \leq p_0 - 1$, we consider the family $\{h_{\ell_p(t)}\}_{0 \leq t \leq 1}$ of polynomial functions defined by

$$h_{\ell_p(t)}(z) := h_0^{\ell_p(t)}(z) \cdots h_{k_0}^{\ell_p(t)}(z),$$

where $\ell_p^k(t) := (1 - t)c_k(p) + t c_k(p + 1)$ is the $k$th coordinate of $\ell_p(t)$. By Theorem 4.8, the Milnor fibrations of $h_{\ell_p(0)}$ and $h_{\ell_p(1)}$ at $0$ are isomorphic. Claim 5.4 then follows from the equalities

$$h_{\ell_0(0)} = F^1 \cdots F^{k_0} \quad \text{and} \quad h_{\ell_{p_0 - 1}(1)} = G^1 \cdots G^{k_0}.$$

This completes the proof of Claim 5.4 (up to Claim 5.5). \hfill $\square$

Now let us prove Claim 5.5.

**Proof of Claim 5.5.** For any $1 \leq k \leq k_0$ and any positive weight vector $w$ defining a (compact) face $\Delta(w; f^k)$ of $\Gamma(f^k)$ with maximal dimension, let us denote by $\theta_{k,1}, \ldots, \theta_{k,q_k}$ the integral points of $\Delta(w; f^k)$. Then, for any $a_k = (a_{k,1}, \ldots, a_{k,q_k}) \in \mathbb{C}^{q_k}$, put

$$\phi_{a_k}^k(z) := \sum_{j=1}^{q_k} a_{k,j} z^{\theta_{k,j}}.$$

Note that $\phi_{a_k}^k$ is weighted homogeneous with respect to $w$. Now, consider the set $U_w$ consisting of the points $(a_1, \ldots, a_{k_0})$ in $\mathbb{C}^{q_1} \times \cdots \times \mathbb{C}^{q_{k_0}}$ satisfying the following two properties:

1. $\Gamma(\phi_{a_k}^k) = \Delta(w; f^k)$ for any $1 \leq k \leq k_0$;
2. for any $1 \leq k_1, \ldots, k_m \leq k_0$, the variety $V(\phi_{a_{k_1}}^{k_1}, \ldots, \phi_{a_{k_m}}^{k_m})$ is a non-degenerate complete intersection variety.

To prove Claim 5.5, it suffices to show that $U_w$ is a Zariski open set. To do that, we first observe that since $\phi_{a_{k,j}}^{k_j}$ $(1 \leq j \leq m)$ is weighted homogeneous, there exist $\lambda_1, \ldots, \lambda_n \in \mathbb{N}^*$ such that the polynomial

$$\phi_{a_{k,j}}^{k_j}(z_1, \ldots, z_n) := \phi_{a_{k,j}}^{k_j}(z_1^{\lambda_1}, \ldots, z_n^{\lambda_n})$$

is homogeneous. Then, since $V(\phi_{a_{k_1}}^{k_1}, \ldots, \phi_{a_{k_m}}^{k_m})$ is non-degenerate if and only if $V(\Phi_{a_{k_1}}^{k_1}, \ldots, \Phi_{a_{k_m}}^{k_m})$ is non-degenerate, we may assume that $\phi_{a_{k,j}}^{k_j}$ is homogeneous for any $1 \leq j \leq m$. Now, observe that for any positive weight vector $w'$, the set $\Delta(w'; f^k)$ is a (compact) face of $\Delta(w; f^k)$, and then consider the set $V_{w'}(w')$ made up of all the points $(a_1, \ldots, a_{k_0}, z) \in \mathbb{P}^{q_1 - 1} \times \cdots \times \mathbb{P}^{q_{k_0} - 1} \times \mathbb{P}^{n - 1}$ for which there exists a subset $K \subseteq \{1, \ldots, k_0\}$ such that:

$$\forall k \in K, \ \phi_{a_{k,j}}^{k_j}(z_1, \ldots, z_n) = 0 \quad \text{and} \quad \bigwedge_{k \in K} d\phi_{a_{k,j}}^{k_j}(z) = 0,$$

where we still denote by $a_1, \ldots, a_{k_0}$ and $z$ the classes of $a_1, \ldots, a_{k_0}$ and $z$ in the projective spaces $\mathbb{P}^{q_1 - 1}, \ldots, \mathbb{P}^{q_{k_0} - 1}$ and $\mathbb{P}^{n - 1}$ respectively. (Once more, let us recall that $\phi_{a_{k,j}}^{k_j}$ denotes the face function of $\phi_{a_{k,j}}^{k_j}$ with respect to the weight vector $w'$. Let $V_{w'}(w')$ be the closure of $V_{w'}(w') := V_{w'}(w') \cap \{z_1 \cdots z_n \neq 0\}$ in $\mathbb{P}^{q_1 - 1} \times \cdots \times \mathbb{P}^{q_{k_0} - 1} \times \mathbb{P}^{n - 1}$. Then $V_{w'}(w')$ is an algebraic set of dimension $\dim V_s(w')$ (see [12] Lemma 3.9). Let

$$\pi : (\mathbb{P}^{q_1 - 1} \times \cdots \times \mathbb{P}^{q_{k_0} - 1}) \times \mathbb{P}^{n - 1} \to \mathbb{P}^{q_1 - 1} \times \cdots \times \mathbb{P}^{q_{k_0} - 1}$$
be the standard projection, and let
\[ W_w^* := \pi(V_w^*) \quad \text{and} \quad \bar{W}_w := \pi(\bar{V}_w), \]
where
\[ V_w^* := \bigcup_{w' \in \mathbb{N}^n} V_w^*(w') \quad \text{and} \quad \bar{V}_w := \bigcup_{w' \in \mathbb{N}^n} \bar{V}_w(w'). \]
Clearly, \( U_w \) is the complement of \((p_1 \times \cdots \times p_{k_0})^{-1}(W_w^*) \cup \{0\}\), where \( p_k : \mathbb{C}^{k_0} \setminus \{0\} \to \mathbb{P}^{k_0 - 1} \) is the standard canonical map. By the proper mapping theorem (see [11, Satz 23]), \( \bar{W}_w \) is an algebraic set containing \( U \).

By the Curve Selection Lemma, there exists a real analytic curve \( 0 \leq b \leq 1 \), and a positive weight vector \( w' \in \mathbb{N}^n \) such that \( \rho(s) \in V_w^*(w') \) for \( s > 0 \) and \( \rho(0) = (a_1, \ldots, a_{k_0}, z) \). For each \( 1 \leq k \leq k_0 \), write
\[ a_k(s) = a_k + a_k^1s + \cdots \quad \text{and} \quad z(s) = (b_1s^{w'_1} + \cdots, b_ns^{w'_n} + \cdots). \]
By the assumption, \( b_i \in \mathbb{C}^* \), \( w'_i \in \mathbb{N} (1 \leq i \leq n) \) and \( \max\{w'_i, 1 \leq i \leq n\} > 0 \). Moreover, for any \( s \neq 0 \), there exists \( K(s) \subseteq \{1, \ldots, k_0\} \) such that:
\[ \forall k \in K(s), \quad \phi_{a_k(s),w'}(z(s)) = 0 \quad \text{and} \quad \bigwedge_{k \in K(s)} d\phi_{a_k(s),w'}(z(s)) = 0. \]
By looking at the leading terms (with respect to \( s \)) in the above expressions, it follows that there exists a subset \( K(0) \subseteq \{1, \ldots, k_0\} \) such that:
\[ \forall k \in K(0), \quad \left( \phi_{a_k,w'}^k \right)_\Delta(b) = 0 \quad \text{and} \quad \bigwedge_{k \in K(0)} d\left( \phi_{a_k,w'}^k \right)_\Delta(b) = 0, \]
where \( b := (b_1, \ldots, b_n) \), \( \Delta \) is the (compact) face of \( \Delta(w'; f_w^k) \) on which the linear form
\[ \alpha \in \Delta(w'; f_w^k) \mapsto \sum_{i=1}^n \alpha_i w''_i \in \mathbb{R} \]
takes its minimal value, and \( \left( \phi_{a_k,w'}^k \right)_\Delta \) is the corresponding face function. However, since \( b_i \in \mathbb{C}^* \) for all \( 1 \leq i \leq n \), the relations \((5.1)\) imply \((a_1, \ldots, a_{k_0}) \in W_w^* \), which is a contradiction. \( \square \)
