Abstract
We consider a degenerate wave equation with drift in presence of a leading operator which is not in divergence form. We provide some conditions for the boundary controllability of the associated Cauchy problem.

1 Introduction

It is well known that standard linear theory for transverse waves in a string of length $L$ under tension leads to the classical wave equation

$$\rho(x) \frac{\partial u}{\partial t^2}(t, x) = \frac{\partial T}{\partial x}(t, x) \frac{\partial u}{\partial x}(t, x) + T(t, x) \frac{\partial^2 u(t, x)}{\partial x^2}.$$ 

Here $u(t, x)$ denotes the vertical displacement of the string from the $x$ axis at position $x \in (0, L)$ and time $t > 0$, $\rho(x)$ is the mass density of the string at position $x$, while $T(t, x)$ denotes the tension in the string at position $x$ and time $t$. Divide by $\rho(x)$, assume $T$ is independent of $t$, and set $a(x) = T(x) \rho^{-1}(x)$, $b(x) = T'(x) \rho^{-1}(x)$. In this way, we obtain

$$\frac{\partial u}{\partial t^2}(t, x) = a(x) \frac{\partial^2 u(t, x)}{\partial x^2} + b(x) \frac{\partial u}{\partial x}(t, x).$$

Now, suppose that the density is extremely large at some point, say $x = 0$, then the previous equation degenerates at $x = 0$, in the sense that we can consider $a(0) = 0$, while the remainder term is a drift one.

Starting from this model, we consider the problem

$$\begin{cases}
    u_{tt} - a(x) u_{xx} - b(x) u_x = 0, & (t, x) \in Q_T, \\
    u(t, 0) = 0, & u(t, 1) = f(t), \quad t > 0, \\
    u(0, x) = u_0(x), & u_1(0, x) = u_1(x), \quad x \in (0, 1),
\end{cases}$$

where $Q_T = (0, T) \times (0, 1)$, $T > 0$. The main feature in this problem is that $a$ degenerates at $x = 0$, and the function $f$ acts as a boundary control and it is used to drive the solution to 0 at a given time $T > 0$.

This problem has not been treated before, but its study seems natural because of the model above. Moreover, it is related to other ones: the problem without drift and with leading operator in divergence form was considered in [1], but it is well known that problems in non divergence or in divergence form require different settings. Moreover, the drift term $bu_x$ cannot be considered just as a small perturbation of the diffusion term $au_{xx}$ (see [12, Chapter 7.2]). These three motivations are the main ones to investigate problem (1.1).

We will look for a control $f \in L^2(0, T)$, knowing that $a, b \in C^0[0, 1]$, $a > 0$ on $(0, 1]$ and $a(0) = 0$. Concerning $b$, it can possibly degenerate at 0. Indeed, we will just require that $\frac{b}{a} \in L^1(0, 1)$: hence, if $a(x) = x^K$, $K > 0$, we can consider $b(x) = x^h$ for any $h > K - 1$. Finally, the initial data $u_0$ and $u_1$ belong to suitable weighted spaces.

As for the function $a$, we consider two cases: $a$ can be weakly degenerate and strongly degenerate. More precisely, we have the following cases.

**Definition 1.1.** A function $a$ is weakly degenerate at 0, (WD) for short, if $a \in C^0[0, 1] \cap C^1(0, 1]$ is such that $a(0) = 0$, $a > 0$ on $(0, 1]$ and, if

$$\sup_{x \in (0, 1]} \frac{x a'(x)}{a(x)} = K,$$
then $K \in (0, 1)$.

**Definition 1.2.** A function $a$ is strongly degenerate at 0, (SD) for short, if $a(0) = 0$, $a > 0$ on $(0, 1]$ and in (1.2) we have $K \in [1, 2)$.

We shall always assume that $K < 2$, since, as in the parabolic case, observability (and thus null controllability) no longer holds true if $K \geq 2$, as we shall show in Section 3 below.

**Remark 1.** Clearly, when $a$ is strongly degenerate we cannot treat the case $b$ strictly positive, since we would have $\frac{1}{a} \not\in L^1(0, 1)$. Hence, if $a$ is strongly degenerate at 0, then $b$ must degenerate at the same point, as well.

Before going on with our problem, let us frame it. Controllability issues for parabolic problems have been a mainstream topic in recent years, and several developments have been pursued: starting from the heat equation in bounded and unbounded domain, related contributions have been found for more general situations. A common strategy in showing controllability results is to prove that certain global Carleman estimates hold true for the operator which is the adjoint of the given one. Such estimates for uniformly parabolic operators without degeneracies or singularities have been largely developed (see, e.g., Fursikov–Imanuvilov [28]). Recently, these estimates have been also studied for operators which are not uniformly parabolic. Indeed, as pointed out by several authors, many problems coming from Physics (see [31]), Biology (see [4], [11], [17], [19], and [27]) and Mathematical Finance (see [30]) are described by degenerate parabolic equations. In this framework, new Carleman estimates and null controllability properties have been established in [2], [9], [10], [20] and [33] for regular degenerate coefficients, in [5] and [21]-[25] for non smooth degenerate coefficients and in [14], [15], [16], [22], [23], [24], [26] and in [40] for degenerate and singular coefficients.

On the contrary, null controllability for degenerate wave equations have received less attention. Let us start recalling that the problem of null controllability for the one dimensional nondegenerate wave equation can be attacked in several ways: for instance, consider the problem

\[
\begin{cases}
    u_{tt} - u_{xx} = f_\omega(t, x), & (t, x) \in Q_T, \\
    u(t, 0) = 0, & u(t, 1) = f(t), \quad t \in (0, T), \\
    u(0, x) = u_0(x), & u_t(0, x) = u_1(x), \quad x \in (0, 1).
\end{cases}
\]

(1.3)

Here $u$ is the state, while $f_\omega$ and $f$ are the controls: one may have $f = 0$ and $f_\omega$ acting as a control localized in the subset $\omega$ of $[0, 1]$, or $f_\omega = 0$ and $f$ acting as a boundary control. In any case, one looks for conditions in order to drive the solution to equilibrium at a given time $T$, i.e. given the initial data $(u_0, u_1)$ in a suitable space, we look for a control ($f$ or $f_\omega$) such that

\[
u(T, x) = u_t(T, x) = 0, \quad \text{for all } x \in (0, 1).
\]

(1.4)
Some comments are in order. First, due to the finite speed of propagation of solutions of the wave equation, we cannot expect to have null controllability at any final time $T$, but we need $T$ to be sufficiently large: for equation (1.3) it is well known that the null controllability problem has a solution if $T > 2$, for instance see [38, Chapter 4]. Second, the Hilbert Uniqueness Method (HUM) permits to characterize such a control in terms of minimum of a certain functional. In details, following [32], in analogy with problem (1.1), consider (1.3) with $f_\omega = 0$ and its adjoint system

$$
\begin{align*}
\begin{cases}
\varphi_{tt} - \varphi_{xx} = 0, & (t, x) \in Q_T, \\
\varphi(t, 0) = \varphi(t, 1) = 0, & t \in (0, T), \\
\varphi(0, x) = \varphi_0(x), & x \in (0, 1).
\end{cases}
\end{align*}
$$

Then, (1.3) is equivalent to the validity of the following observability inequality

$$
\| (\varphi_0, \varphi_1) \|_{H^1_0(0, 1) \times L^2(0, 1)}^2 \leq C \int_0^T |\varphi_x(t, 1)|^2 \, dt,
$$

where $C = C(T) > 0$ is a universal constant. Such an inequality guarantees the coercivity of the functional $J : H_0^1(0, 1) \times L^2(0, 1) \to \mathbb{R}$ defined as

$$
J(\varphi_0, \varphi_1) = \frac{1}{2} \int_0^T |\varphi_x(t, 1)|^2 \, dt + \int_0^1 \varphi_1 u_0 dx - \langle \varphi_0, u_1 \rangle_{H^{-1}, H^1_0},
$$

where $\varphi$ solves (1.5) with initial data $(\varphi_0, \varphi_1)$. As a consequence, $J$ has a unique minimizer $(\tilde{\varphi}_0, \tilde{\varphi}_1)$. Then, the control $f$ which drives the solution of (1.3) to 0 at time $T$ is given by

$$
f(t) = \tilde{\varphi}_x(t, 1),
$$

where $\tilde{\varphi}$ is the solution of (1.5) with initial data $(\tilde{\varphi}_0, \tilde{\varphi}_1)$. A related approach for (1.3) with $f = 0$ is showed in [37].

In [36] the authors investigate the problem of maximizing the observability constant, or its asymptotic average in time, over all possible subsets $\omega$ of $[0, \pi]$ of Lebesgue measure $L\pi$. In [35] the author considers the controllability problem of a semilinear wave equation with a control multiplying the nonlinear term.

To our knowledge, [29] is the first paper where a degenerate equation of wave type is considered: more precisely, the author considers the equation in divergence form without drift

$$
u_{tt} - (x^\alpha u_x)_x = 0
$$

for $\alpha \in (0, 1)$ and the control acts in the degeneracy point $x = 0$. Later on, in [1] the authors consider the equation

$$
u_{tt} - (a(x)u_x)_x = 0
$$

where $a$ degenerates at $x = 0$. In this case the authors establish observability inequalities for weakly as well as strongly degenerate equations. They also
prove a negative result when the diffusion coefficient degenerates too violently (i.e. when $K > 2$) and the blow-up of the observability time when $K$ converges to 2 from below. We underline the fact that in both papers [1] and [29] the notion of solution is the one in the transposition sense (see Section 4). However, the observability inequality, and hence the null controllability result, in [29] is obtained via spectral analysis, while in [1] via suitable energy estimates.

We also mention the recent paper [39], where the author studies (1.3) with two linearly moving endpoints, establishing observability results in a sharp time and deriving exact boundary controllability results.

As far as we know, this is the first paper where the equation is in non divergence form and $b \neq 0$. Clearly the presence of the drift term leads us to use different spaces with respect to the ones in [1] and gives rise to some difficulties that we do not find, for example, in [1]. However, thanks to some suitable assumptions on the drift term, one can prove some estimates that are crucial to prove an observability similar to (1.6), namely

$$E_{\varphi}(0) \leq C_T \int_0^T |\varphi_x(t, 1)|^2 dt,$$

where $C_T$ is a strictly positive universal constant. Here $E_{\varphi}$ denotes the energy of $\varphi$, solution of (1.5), see (3.16) below for its precise definition.

The paper is organized as follows: in Section 2 we study well posedness of the original problem with Dirichlet boundary conditions; in Section 3 we consider the adjoint problem of (1.1) and we prove that for this kind of problem the associated energy is constant through the time. Thanks to this property and to some estimates established in Section 3, we will prove in the last section that (1.1) is null controllable under suitable assumptions.

Notations:
by $C$ we shall denote universal positive constants which are allowed to vary from line to line;
by $'$ we denote the derivative of a function depending on the real space variable $x$;
by $\dot{}$ we denote the derivative of a function depending on the real time variable $t$.

2 Well posedness for the problem with homogeneous Dirichlet boundary conditions

We start assuming very low regularity conditions on the coefficients, but for the functional setting the assumption below is sufficient, while more restrictive ones will be needed below.

**Hypothesis 2.1.** Functions $a$ and $b$ are continuous functions in $[0, 1]$ such that $\frac{b}{a} \in L^1(0, 1)$. 
Now consider the degenerate hyperbolic problem with Dirichlet boundary conditions
\[
\begin{cases}
y_{tt} - ay_{xx} - by_x = 0, & (t, x) \in (0, +\infty) \times (0, 1), \\
y(t, 1) = y(t, 0) = 0, & t \in (0, +\infty), \\
y(0, x) = y_0^T(x), & x \in (0, 1), \\
y_t(0, x) = y_1^T(x), & x \in (0, 1).
\end{cases}
\]
(2.8)

We anticipate the fact that the choice of denoting initial data with \(T\)-dependence is related to the approach for null controllability used in Section 4.

In order to study the well-posedness of (2.8), let us recall the well-known absolutely continuous weight function
\[
\eta(x) := \exp \left\{ \int_0^x \frac{b(s)}{a(s)} \, ds \right\}, \quad x \in [0, 1],
\]
introduced by Feller in a related context [13] and used by several authors, see, e.g., [8], [12] and [34]. Define
\[
\sigma(x) := a(x) \eta^{-1}(x),
\]
and observe that if \(y\) is sufficiently smooth, e.g. \(y \in W^{2,1}_{loc}(0, 1)\), then
\[
Ay := ay_{xx} + by_x = \sigma(y_{xx}),
\]
(2.9)
for almost every \(x \in (0, 1)\). Moreover, since \(\frac{b}{a} \in L^1(0, 1)\), we immediately find that \(\eta \in C^0[0, 1] \cap C^1(0, 1)\) is a strictly positive function. Notice also that \(\eta\) can be extended to a function of class \(C^1[0, 1]\) when \(b\) degenerates at 0 not slower than \(a\), for instance if \(a(x) = x^K\) and \(b(x) = x^h\) with \(K \leq h\).

As in [8], let us consider the following Hilbert spaces with the related inner products:
\[
L^2_{\frac{\eta}{a}}(0, 1) := \left\{ u \in L^2(0, 1) \mid \|u\|_{\frac{\eta}{a}} < \infty \right\}, \quad \langle u, v \rangle_{\frac{\eta}{a}} := \int_0^1 uv \frac{1}{\sigma} dx,
\]
for every \(u, v \in L^2_{\frac{\eta}{a}}(0, 1)\);
\[
H^1_{\frac{\eta}{a}}(0, 1) := L^2_{\frac{\eta}{a}}(0, 1) \cap H^1_0(0, 1), \quad \langle u, v \rangle_1 := \langle u, v \rangle_{\frac{\eta}{a}} + \int_0^1 u'v' dx,
\]
for every \(u, v \in H^1_{\frac{\eta}{a}}(0, 1)\);
\[
H^2_{\frac{\eta}{a}}(0, 1) := \left\{ u \in H^1_{\frac{\eta}{a}}(0, 1) \mid Au \in L^2_{\frac{\eta}{a}}(0, 1) \right\}, \quad \langle u, v \rangle_2 := \langle u, v \rangle_1 + \langle Au, Av \rangle_{\frac{\eta}{a}},
\]
for every \(u, v \in H^2_{\frac{\eta}{a}}(0, 1)\).

It turns out that the norm in \(H^1_{\frac{\eta}{a}}(0, 1)\) defined above is equivalent to the standard norm \(\int_0^1 |u'|^2 dx\) for all \(u \in H^1_{\frac{\eta}{a}}(0, 1)\) (see Corollary 2.1 below), even requiring less restrictive conditions on \(a\), if compared to the degeneracy ones described above.
Hypothesis 2.2. Hypothesis 2.1 holds. In addition, \( a \in C^0[0, 1] \) is such that \( a(0) = 0, a > 0 \) on \((0, 1]\) and there exists \( K \in (0, 2) \) such that the function
\[
x \mapsto \frac{x^K}{a(x)}
\]
is nondecreasing near \( x = 0 \).

Notice that here we require only continuity on \( a \) (and no differentiability) and that the monotonicity property (which holds globally in \((0, 1]\) if \( a \) is (WD) or (SD)) is required only in a right neighborhood of 0.

The next result is related to a similar one proved in [7] for problems without drift.

Proposition 2.1 (Hardy-Poincaré Inequality). Assume that Hypothesis 2.2 is satisfied. Then, there exists \( C > 0 \) such that
\[
\int_0^1 v^2 \sigma dx \leq C \int_0^1 (v')^2 dx \quad \forall v \in H^1_{\frac{1}{2}}(0, 1).
\]

Proof. Take \( v \in H^1_{\frac{1}{2}}(0, 1) \) and observe that, by definition of \( \sigma \),
\[
\int_0^1 v^2 \sigma dx = \int_0^1 v^2 \frac{1}{a} \eta dx \leq C \int_0^1 v^2 dx.
\]

Thus it is sufficient to estimate \( \int_0^1 \frac{v^2}{a} dx \). To this aim, observe that the assumption \( \frac{x^K}{a} \) is nondecreasing near 0” implies that there exists a positive constant \( C \) such that \( x^K \leq Ca(x) \) near 0. Then, for a suitable \( \varepsilon > 0 \) and using Hardy’s inequality
\[
\int_0^1 \frac{v^2}{a} dx = \int_0^\varepsilon \frac{v^2}{a} dx + \int_\varepsilon^1 \frac{v^2}{a} dx \leq C \int_0^1 \frac{v^2}{x^K} dx + \int_\varepsilon^1 \frac{v^2}{a} dx
\]
\[
\leq C \int_0^1 \frac{v^2}{x^2} dx + \int_\varepsilon^1 \frac{v^2}{a} dx \leq C \int_0^1 (v')^2 dx + \int_\varepsilon^1 \frac{v^2}{a} dx
\]
\[
\leq C \left( \int_0^1 (v')^2 dx + \int_\varepsilon^1 v^2 dx \right) \leq C \left( \int_0^1 (v')^2 dx + \int_0^1 v^2 dx \right).
\]
Now,
\[
|v(x)| \leq \int_0^x |v'(x)| dx \leq C \left( \int_0^1 |v'(x)|^2 dx \right)^{\frac{1}{2}} \left( \int_0^x dx \right)^{\frac{1}{2}}.
\]
Hence
\[
v^2(x) \leq C \|v'\|_{L^2(0, 1)}^2
\]
and
\[
\int_0^1 v^2(x) dx \leq C \|v'\|_{L^2(0, 1)}^2.
\]
As a consequence, one has
\[
\int_0^1 v^2 \frac{1}{\sigma} \, dx \leq C \int_0^1 v^2 \frac{1}{a} \, dx \leq C \int_0^1 (v')^2 \, dx,
\]
as desired. \hfill \Box

Thanks to the previous proposition, one has that the spaces \( H^1_\sigma(0, 1) \) and \( H^{1/2}_\sigma(0, 1) \) algebraically coincide. In particular, we have the equivalence below.

**Corollary 2.1.** Assume Hypothesis 2.2. Then the two norms
\[
\|u\|_1^2 := \int_0^1 u^2 \frac{1}{\sigma} \, dx + \int_0^1 (u')^2 \, dx,
\]
and
\[
\|u\|_2^2 := \int_0^1 (u')^2 \, dx,
\]
are equivalent in \( H^{1/2}_\sigma(0, 1) \).

Hence, we introduce the last Hilbert space
\[
\mathcal{H}_0 := H^{1/2}_\sigma(0, 1) \times L^2_\sigma(0, 1),
\]
endowed with the inner product
\[
\langle (u, v), (\tilde{u}, \tilde{v}) \rangle_{\mathcal{H}_0} := \int_0^1 u' \tilde{u'} \, dx + \int_0^1 \tilde{v} \frac{1}{\sigma} \, dx
\]
for every \((u, v), (\tilde{u}, \tilde{v}) \in \mathcal{H}_0\) and with the norm
\[
\|(u, v)\|_{\mathcal{H}_0}^2 := \int_0^1 (u')^2 \, dx + \int_0^1 \tilde{v}^2 \frac{1}{\sigma} \, dx
\]
for every \((u, v) \in \mathcal{H}_0\).

Finally, define the domain \(D(A)\) of the operator \(A\), given in (2.9), as
\[
D(A) = H^{1/2}_\sigma(0, 1)
\]
and denote by \(H^{-1/2}_\sigma(0, 1)\) the dual space of \(H^{1/2}_\sigma(0, 1)\) with respect to the pivot space \(L^2_\sigma(0, 1)\). As in [6, Proposition 8.14], one can prove that the operator \(A\) is an isomorphism from \(H^{1/2}_\sigma(0, 1)\) onto \(H^{-1/2}_\sigma(0, 1)\). In particular, we have \(H^{-1/2}_\sigma(0, 1) = AH^{1/2}_\sigma(0, 1)\).

In order to study the well posedness of problem (2.8), we introduce the matrix operator \(A : D(A) \subset \mathcal{H}_0 \to \mathcal{H}_0\), given by
\[
A := \begin{pmatrix} 0 & Id \\ A & 0 \end{pmatrix}, \quad D(A) := H^{1/2}_\sigma(0, 1) \times H^{1/2}_\sigma(0, 1).
\]
Observe that, as proved in [8, Lemma 1], we have that for all \((u, v) \in D(A)\)
\[
< Au, v >_{\frac{1}{\sigma}} = -\int_0^1 \eta u' v' \, dx.
\] (2.11)

As a consequence, the operator \((A, D(A))\) is \(m\)–dissipative and selfadjoint in
\(L^2_{\frac{1}{\sigma}}(0, 1)\) (see [8, Theorem 1]). Thus, it generates a strongly continuous semi-
group. As a consequence, \(A\) generates a strongly continuous semigroup \((S(t))_{t \geq 0}\)
on \(H_0\), as well.

Thus, by using the operator \((A, D(A))\), we rewrite \([8] 2.8\) as a Cauchy prob-
lem. Indeed, setting, as usual,
\[
\mathcal{Y}(t) := \begin{pmatrix} y \\ y_t \end{pmatrix} \quad \text{and} \quad \mathcal{Y}_0 := \begin{pmatrix} y^0_T \\ y^0_T \end{pmatrix},
\]
one has that \([8, 2.8]\) can be rewritten as
\[
\begin{cases}
\dot{\mathcal{Y}}(t) = A\mathcal{Y}(t), & t \geq 0, \\
\mathcal{Y}(0) = \mathcal{Y}_0.
\end{cases}
\] (2.12)

Hence if \(\mathcal{Y}_0 \in H_0\), then \(\mathcal{Y}(t) = S(t)\mathcal{Y}_0\) gives the mild solution of \((2.12)\). If \(\mathcal{Y}_0 \in D(A)\), then the solution is classical, in the sense that \(\mathcal{Y} \in C^1([0, +\infty); H_0) \cap C([0, +\infty); D(A))\) and the equation in \((2.8)\) holds for all \(t \geq 0\). Hence, as in [1] or in [3, Proposition 3.15], one has the following theorem.

**Theorem 2.1.** Assume Hypothesis 2.2.

If \((y^0_T, y^1_T) \in H_0\), then there exists a unique mild solution
\[
y \in C^1([0, +\infty); L^2_{\frac{1}{\sigma}}(0, 1)) \cap C([0, +\infty); H^1_{\frac{1}{\sigma}}(0, 1))
\]
of \((2.8)\) which depends continuously on the initial data \((y^0_T, y^1_T) \in H_0\). Moreover, if \((y^0_T, y^1_T) \in D(A)\), then the solution \(y\) is classical, in the sense that
\[
y \in C^2([0, +\infty); L^2_{\frac{1}{\sigma}}(0, 1)) \cap C^1([0, +\infty); H^1_{\frac{1}{\sigma}}(0, 1)) \cap C([0, +\infty); H^2_{\frac{1}{\sigma}}(0, 1))
\]
and the equation of \((2.8)\) holds for all \(t \geq 0\).

**Remark 2.** Of course, due to the reversibility (in time) of the equation, solutions exist with the same regularity also for \(t < 0\). This will be used in Section 4.

Observe that if \(a\) is weakly or strongly degenerate, then \((1.2)\) implies that the function
\[
x \mapsto \frac{x^\gamma}{a(x)} \quad (2.13)
\]
is nondecreasing in \((0, 1]\) for all \(\gamma \geq K\). In particular, Hypothesis 2.2 is satisfied. Moreover,
\[
\lim_{x \to 0} \frac{x^\gamma}{a(x)} = 0 \quad (2.14)
\]
for all $\gamma > K$ and
\[
\left| \frac{x^\gamma b(x)}{a(x)} \right| \leq \frac{1}{a(1)} \|b\|_{L^\infty(0,1)}
\]
for all $\gamma \geq K$. Let
\[
M := \frac{\|b\|_{L^\infty(0,1)}}{a(1)}.
\] (2.15)

The two properties above will play a crucial role in the following sections.

### 3 Energy estimates and boundary observability

In this section we prove estimates of the energy associated to the solution of the initial value problem both from below and from above. The former will be used in the next section to prove a controllability result, while the latter is used here to prove a boundary observability inequality.

Let $y$ be a mild solution of (2.8) and consider its energy given by the continuous function defined as
\[
E_y(t) = \frac{1}{2} \int_0^1 \left( \frac{1}{\sigma} y_t^2(t,x) + \eta y_x^2(t,x) \right) dx, \quad \forall \ t \geq 0.
\] (3.16)

With the definition above, the classical conservation of the energy still holds true also in the degenerate case with drift:

**Theorem 3.1.** Assume Hypothesis 2.2 and let $y$ be a mild solution of (2.8). Then
\[
E_y(t) = E_y(0), \quad \forall \ t \geq 0.
\] (3.17)

**Proof.** First of all suppose that $y$ is a classical solution. Then multiplying the equation by $\frac{y_t}{\sigma}$, integrating over $(0,1)$ and using the boundary conditions one has
\[
0 = \frac{1}{2} \int_0^1 \frac{d}{dt} \left( \frac{y_t^2}{\sigma} \right) dx - \left[ \eta y_x y_t \right]_{x=0}^1 + \int_0^1 \eta y_x y_{tx} dx
\]
\[
= \frac{1}{2} \frac{d}{dt} \int_0^1 \left( \frac{y_t^2}{\sigma} + \eta y_x^2 \right) dx = \frac{1}{2} \frac{d}{dt} E_y(t).
\]

Hence, the energy of $y$ is constant.

If $y$ is a mild solution, we approximate the initial data with more regular ones, obtaining associated classical solutions (for which (3.17) holds), and with the usual estimates we can pass to the limit and obtain the desired result. □

As announced in the introduction, we shall prove an observability inequality like (1.7). In the following we will distinguish between the weakly and the strongly degenerate case.
3.1 The weakly degenerate case

We specify Hypothesis 2.1, assuming the following

**Hypothesis 3.1.** Hypothesis 2.2 holds and \( a \) is (WD) at 0.

Notice that \( b \) needs not being degenerate at 0. The next preliminary result holds.

**Theorem 3.2.** Assume Hypothesis 3.1. If \( y \) is a mild solution of (2.8), then

\[
\int_0^T y_x^2(t,1)dt = \int_0^T \left( \frac{xy_x y_t}{\sigma} \right)_{t=0}^{1} dx - \frac{1}{2} \int_{Q_T} x y_x y_t \sigma x dx dt + \frac{1}{2} \int_{Q_T} \eta y_x^2 dx dt
\]

\[
+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt.
\]

(3.18)

As a consequence,

\[
\eta(1) \int_0^T y_x^2(t,1)dt \leq 2 \left( (1 + K + M) T + 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} \right) E_y(0),
\]

(3.19)

where \( M \) is the constant introduced in (2.15).

**Proof.** As in the proof of Theorem 3.1, we first assume that \( y \) is a classical solution of (2.8).

We multiply the equation in (2.8) by \( \frac{xy_x}{\sigma} \) and we integrate over \( Q_T \). Recalling (2.9) and integrating by parts, we have

\[
0 = \int_{Q_T} \frac{y_x y_t}{\sigma} x y_x dx dt - \int_{Q_T} \frac{xy_x y_t}{\sigma} x y_x dx dt - \int_{Q_T} \eta y_x^2 dx dt
\]

(3.20)

Now,

\[
\frac{1}{2} \int_{Q_T} \left( \frac{x}{\sigma} \right)_x y_t^2 dx dt = \frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt
\]

and

\[
\frac{1}{2} \int_{Q_T} (xy)_x y_t^2 dx dt = \frac{1}{2} \int_{Q_T} \eta y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \frac{b}{a} y_t^2 dx dt.
\]
Hence, (3.20) reads
\[
\frac{1}{2} \int_0^T \left[ \frac{x y^2}{\sigma} \right]_{x=0}^{x=1} dt = \int_0^T \left[ \frac{x y}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_0^T \left[ \frac{x y^2}{\sigma} \right]_{x=0}^{x=1} dt - \int_{Q_T} \frac{b}{a} y^2 dx dt
\]
\[
+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \eta y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \frac{b}{a} y_x^2 dx dt
\]
\[
= \int_0^T \left[ \frac{x y^2}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_0^T \left[ \frac{x y^2}{\sigma} \right]_{x=0}^{x=1} dt - \frac{1}{2} \int_{Q_T} \frac{b}{a} y_x^2 dx dt
\]
\[
+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \eta y_t^2 dx dt.
\]

Since \( K < 1 \), by (2.13) we have
\[
\frac{1}{2} \left| \int_{Q_T} \frac{b}{a} y_x^2 dx dt \right| \leq \frac{1}{2} \int_{Q_T} \left| \frac{b}{a} y_x^2 \right| dx dt \leq \frac{1}{2} M \int_{Q_T} \eta y_t^2 dx dt,
\]
where \( M \) is given in (2.15). Moreover, by Hypothesis 3.1, we have
\[
\frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt \leq \frac{1}{2} (1 + K + M) \int_{Q_T} \frac{1}{\sigma} y_t^2 dx dt.
\]

Now, we consider the boundary terms. Thanks to the boundary conditions of \( y \) and (2.14), one can prove that
\[
\lim_{x \to 0} \frac{x y^2(t, x)}{\sigma} = \lim_{x \to 0} \frac{x}{\sigma} \eta y_t^2(t, x) = 0
\]
and \( \frac{1}{\sigma(1)} y_t^2(t, 1) = \frac{\eta(1)}{a(1)} y_t^2(t, 1) = 0 \), hence
\[
\int_0^T \left[ \frac{x y^2}{\sigma} \right]_{x=0}^{x=1} dt = 0.
\]

In addition,
\[
\int_0^T [x y^2]_{x=0}^{x=1} dt = \int_0^T \eta(1) y_t^2(t, 1) dt.
\]

Observing that, by (2.13), one has
\[
\left| \int_0^1 \frac{x y_x(\tau, x) y_t(\tau, x)}{\sigma} dx \right| \leq \int_0^1 \left| \frac{x y_x(\tau, x) y_t(\tau, x)}{\sigma} \right| dx \leq \frac{1}{2} \int_0^1 \frac{x^2}{\sigma} y_t^2 dx + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
= \frac{1}{2} \int_0^1 \frac{x}{a} y_x^2(\tau, x) dx + \frac{1}{2} \int_0^1 \frac{1}{\sigma} y_x^2(\tau, x) dx
\]
\[
\leq \frac{1}{2a(1)} \int_0^1 \eta(1) y_t^2(\tau, x) dx + \frac{1}{2} \int_0^1 \frac{y_t^2(\tau, x)}{\sigma} dx.
\]
for all $\tau \in [0, T]$. By Theorem 3.1 we get

$$\int_0^1 \left[ \frac{xy_y x}{\sigma} \right]_{t=0}^{t=T} \leq \frac{1}{2} a(1) \int_0^1 \eta y_x^2(T, x) dx + \frac{1}{2} \int_0^1 y^2(T, x) dx$$

+ \frac{1}{2} a(1) \int_0^1 \eta y_x^2(0, x) dx + \frac{1}{2} \int_0^1 (y^2(0, x)) dx

$$\leq 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0).$$

(3.27)

Hence, by (3.21)-(3.27) and by (3.17), one has

$$\eta(1) \int_0^T y_x^2(t, 1) dt \leq 2 (1 + K + M) T E_y(0) + 4 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0)$$

for all $T \geq 0$.

Now, assume that $y$ is the mild solution associated to the initial data $(y_0, y_1) \in \mathcal{H}_0$. Then, consider a sequence $\{(y_0^n, y_1^n)\}_{n \in \mathbb{N}} \in D(A)$ that approximate $(y_0, y_1)$ and let $y^n$ be the classical solution of (2.8) associated to $(y_0^n, y_1^n)$. Clearly $y^n$ satisfies (3.19) and thanks to Theorem 2.1 we can pass to the limit and conclude.

Remark 3. If $a(x) = \alpha x^K$ and $b(x) = \beta x^K$, condition (3.28) is satisfied if $|\beta| < \sqrt{\frac{3}{2}}$.

2. If $a(x) = x^K$ and $b(x) = x^h$, $K, h > 0$, then

$$x^2 \left( \frac{b}{a} \left( \frac{x^b}{a} \right)_x + \left( \frac{x^b}{a} \right)_{xx} \right) = (h+1-K)x^{2(h-K+1)} + (h+1-K)(h-K)x^{h-K+1}$$

and the right hand side is bounded if $h \geq K - 1$. Clearly, this is satisfied since we are in the weakly degenerate case, that is $K < 1$. 

13
Lemma 3.1. Assume Hypothesis 3.2. If \( y \) is a mild solution of (2.8), then

\[
0 = \int_0^1 \left[ \frac{y_t x^b}{a \sigma} \right]_{t=0}^{t=T} dx - \int_{Q_T} \frac{y_t^2 x^b}{a \sigma} dx dt + \int_{Q_T} \eta y^2 x^b dt
- \frac{1}{2} \int_{Q_T} \eta \left[ \frac{b}{a} \left( \frac{x^b}{a} \right)_x + \left( \frac{x^b}{a} \right)_{xx} \right] y^2 dx dt
\]  

(3.29)

for any \( T > 0 \).

Proof. Without loss of generalization, we assume that \( y \) is a classical solution (again, the claim will follow by approximation). Now, multiplying the equation by \( \frac{x^b}{a \sigma} \) and integrating over \( Q_T \), where \( T \) is fixed, we obtain

\[
0 = \int_{Q_T} \frac{y_t x^b}{a \sigma} dx dt - \int_{Q_T} (\eta y_x)_x \frac{x^b}{a} dx dt.
\]

Integrating by parts and using the boundary conditions, the claim follows. Indeed

\[
0 = \int_0^1 \left[ \frac{y_t x^b}{a \sigma} \right]_{t=0}^{t=T} dx - \int_{Q_T} \frac{y_t^2 x^b}{a \sigma} dx dt
- \int_0^T \left[ \eta y_x \frac{x^b}{a} \right]_{x=0}^{x=1} dt + \int_{Q_T} \eta y_x \left( \frac{x^b}{a} \right)_x dx dt
= \int_0^1 \left[ \frac{y_t x^b}{a \sigma} \right]_{t=0}^{t=T} dx - \int_{Q_T} \frac{y_t^2 x^b}{a \sigma} dx dt
+ \int_{Q_T} \eta y^2 x^b dx dt + \frac{1}{2} \int_{Q_T} \eta \left( \frac{x^b}{a} \right)_x (y^2)_x dx dt
= \int_0^1 \left[ \frac{y_t x^b}{a \sigma} \right]_{t=0}^{t=T} dx - \int_{Q_T} \frac{y_t^2 x^b}{a \sigma} dx dt
+ \int_{Q_T} \eta y^2 x^b dx dt + \frac{1}{2} \int_0^T \left[ \eta \left( \frac{x^b}{a} \right)_x y^2 \right]_{x=0}^{x=1} dx dt
- \frac{1}{2} \int_{Q_T} \eta y^2 dx dt
= \int_0^1 \left[ \frac{y_t x^b}{a \sigma} \right]_{t=0}^{t=T} dx - \int_{Q_T} \frac{y_t^2 x^b}{a \sigma} dx dt
+ \int_{Q_T} \eta y^2 x^b dx dt - \frac{1}{2} \int_{Q_T} \eta \left( \frac{x^b}{a} \right)_x y^2 dx dt
- \frac{1}{2} \int_{Q_T} \eta y^2 dx dt.
\]

Notice that all integrations are justified, since \( \frac{x^b}{a \sigma} \in L^1(0, 1) \) and 

\[
\left| \frac{x^b}{a} \right| \leq M,
\]

14
where $M$ is defined in (2.15).

Before proving the next result, we make an additional hypothesis, similar to the analogous one made in [8].

**Theorem 3.3.** Assume Hypothesis 3.2. If

$$\max \left\{ K, 2C_b \frac{\max\{\eta, 1\}}{\min\{\eta, 1\}} \right\} < 1$$

(3.30)

and $y$ is a mild solution of (2.8), then

$$\eta(1) \int_0^T y_x^2(t, 1) dt \geq 2 \left( C_{K,b} T - 2 \max \left\{ M^2 \frac{\max\{\eta, 1\}}{\min\{\eta, 1\}}, 1, \frac{1}{a(1)} \right\} \right) E_y(0),$$

(3.31)

for any $T > 0$. Here

$$C_{K,b} := 1 - \max \left\{ K, \frac{2C_b \max\{\eta, 1\}}{\min\{\eta, 1\}} \right\}$$

(3.32)

and $M$ is the constant defined in (2.15).

**Proof.** As in the previous proof assume $y$ a classical solution. Again the thesis will follow by approximation.

Then, multiplying (3.29) by $\frac{1}{2}$ and adding the result to (3.18), we obtain

$$\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt = \int_0^1 \left[ \frac{xy_yy_t}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_{Q_T} xy_y \frac{b}{a} dxdt + \frac{1}{2} \int_{Q_T} \eta y_x^2 dxdt$$

$$+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{a(a_x - b)}{a^2} \right) \frac{1}{\sigma} y_x^2 dxdt + \frac{1}{2} \int_{Q_T} \eta y_x^2 dxdt$$

$$- \frac{1}{2} \int_{Q_T} \eta y_x^2 dxdt + \frac{1}{2} \int_{Q_T} \eta y_x^2 dxdt$$

$$- \frac{1}{4} \int_{Q_T} \eta \left[ \frac{b}{a} \left( \frac{a_x}{a} \right)_x + \left( \frac{a_x}{a} \right)_x \right] y_x^2 dxdt$$

$$= \int_0^1 \left[ \frac{xy_yy_t}{\sigma} \right]_{t=0}^{t=T} dx + \frac{1}{2} \int_{Q_T} \eta y_x^2 dxdt$$

$$+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{a_a}{a} \right) \frac{1}{\sigma} y_x^2 dxdt + \frac{1}{2} \int_0^1 \left[ \frac{y_y y_t}{a \sigma} \right]_{t=0}^{t=T} dx$$

$$- \frac{1}{4} \int_{Q_T} \eta \left[ \frac{b}{a} \left( \frac{a_x}{a} \right)_x + \left( \frac{a_x}{a} \right)_x \right] y_x^2 dxdt.$$
By (1.2), (3.27) and Theorem 3.1, one has
\[
\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt \geq T E_y(0) - \frac{K}{2} \int_{Q_T} \frac{1}{\sigma} y_t^2 dx dt - 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0)
\]
\[
+ \frac{1}{2} \int_0^1 \left[ \frac{y_t x y_t}{a \sigma} \right]_{t=0}^{t=T} dx - \frac{1}{4} \int_{Q_T} \eta \left[ \frac{b}{a} \left( \frac{x b}{a} \right)_x + \left( \frac{x b}{a} \right)_{xx} \right] y_x^2 dx dt.
\]

(3.33)

It remains to estimate the last two integrals. Consider, first of all, \( \frac{1}{2} \int_0^1 \left[ \frac{y_t x y_t}{a \sigma} \right]_{t=0}^{t=T} dx \).

It holds
\[
\left| \frac{1}{2} \int_0^1 \frac{y_t x y_t}{a \sigma} dx \right| \leq \frac{1}{2} \int_0^1 \left| \frac{y_t x y_t}{a \sigma} \right| dx \leq \frac{1}{2} \int_0^1 \frac{x^2 b^2}{a^2 \sigma} y_x^2 dx + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
\leq \frac{M^2}{2} \int_0^1 \frac{\eta x^2}{a} y_x^2 + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
\leq \frac{M^2 \max_{[0,1]} \eta}{2a(1)} \int_0^1 \frac{1}{x^2} y_x^2 dx + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
\leq \frac{M^2 \max_{[0,1]} \eta}{2a(1)} \int_0^1 y_x^2 dx + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
\leq \frac{M^2 \max_{[0,1]} \eta}{2a(1) \min_{[0,1]} \eta} \int_0^1 \eta y_x^2 dx + \frac{1}{2} \int_0^1 \frac{y_t^2}{\sigma} dx
\]
\[
\leq \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1 \right\} E_y(0),
\]
by Theorem 3.1. Hence,
\[
\left| \frac{1}{2} \int_0^1 \left[ \frac{y_t x y_t}{a \sigma} \right]_{t=0}^{t=T} dx \right| \leq 2 \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1 \right\} E_y(0),
\]
(3.34)

Moreover, by Hypothesis 3.2 and proceeding as before, one has
\[
\frac{1}{4} \int_{Q_T} \eta \left[ \frac{b}{a} \left( \frac{x b}{a} \right)_x + \left( \frac{x b}{a} \right)_{xx} \right] y_x^2 dx dt \leq \frac{1}{4} \int_{Q_T} \left| \frac{b}{a} \left( \frac{x b}{a} \right)_x + \left( \frac{x b}{a} \right)_{xx} \right| \eta y_x^2 dx dt
\]
\[
\leq \frac{C_b \max_{[0,1]} \eta}{4} \int_{Q_T} \frac{y_x^2}{x^2} dx dt \leq \frac{C_b \max_{[0,1]} \eta}{\min_{[0,1]} \eta} \int_{Q_T} y_x^2 dx dt \leq \frac{C_b \max_{[0,1]} \eta}{\min_{[0,1]} \eta} \int_{Q_T} \eta y_x^2 dx dt,
\]
(3.35)

where we have used the classical Hardy inequality
\[
\int_0^1 y_x^2 dx \leq 4 \int_0^1 y_x^2 dx
\]
for any \( y \in H^0_0(0,1) \). Hence, by (3.33), (3.34) and (3.35), it results

\[
\frac{1}{2} \eta(1) \int_0^T y_x^2(t,1)dt \geq TE_y(0) - \frac{K}{2} \int_{Q_T} \frac{1}{\sigma} y_x^2 dx dt - 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0)
\]

\[
- 2 \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1 \right\} E_y(0) - \frac{C_b \max_{[0,1]} \eta}{\min_{[0,1]} \eta} \int_{Q_T} \eta y_x^2 dx dt
\]

\[
\geq TE_y(0) - \frac{1}{2} \max \left\{ K, \frac{2C_b \max_{[0,1]} \eta}{\min_{[0,1]} \eta} \right\} \left( \int_{Q_T} \frac{1}{\sigma} y_x^2 dx dt + \int_{Q_T} \eta y_x^2 dx dt \right)
\]

\[
- 2 \max \left\{ \frac{M^2 \max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1, \frac{1}{a(1)} \right\} E_y(0)
\]

\[
= T \left( 1 - \max \left\{ K, \frac{2C_b \max_{[0,1]} \eta}{\min_{[0,1]} \eta} \right\} \right) E_y(0)
\]

\[
- 2 \max \left\{ \frac{M^2 \max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1, \frac{1}{a(1)} \right\} E_y(0).
\]

Hence, recalling the definition of \( C_{K,b} \) given in (3.32), we have

\[
\frac{1}{2} \eta(1) \int_0^T y_x^2(t,1)dt \geq \left( C_{K,b} T - 2 \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1, \frac{1}{a(1)} \right\} \right) E_y(0).
\]

\[\square\]

**Remark 4.** Observe that (3.30) implies that

\[
2C_b \max_{[0,1]} \eta < \min_{[0,1]} \eta < \max_{[0,1]} \eta.
\]

Hence, we need \( C_b < \frac{1}{2} \). Clearly, if \( a(x) = x^K \) and \( b(x) = x^h \), then \( C_b < \frac{1}{2} \) is possible if \( h < K - 1 + \sqrt{\frac{1}{2}} \) (recall that in this case \( h > K - 1 \), see Remark 3.2).

Another example with \( b \) being (SD) is given by

\[
a(x) = x^K \quad \text{and} \quad b(x) = \frac{x^{K+1}}{x^2 - 2}
\]

with \( \epsilon \) small enough.

Actually, an analogous result of Theorem 3.3 can be proved under different assumption on \( b \). Indeed, by suitably adapting its proof, we can prove that an analogous result still holds true if we remove Hypothesis 3.2 requiring either

- \( b \) is nonnegative and \( M < 1 \), or
- \( M + K < 1 \).

Hence, thanks to the next results we can also consider a non degenerate function \( b \) or a function \( b \) weakly degenerate at 0. Recall that Theorem 3.3 holds, in particular, if \( a \) is weakly and \( b \) is strongly degenerate at 0, see the example in (3.36). Again, \( M \) is the constant introduced in (2.14).
Theorem 3.4. Assume Hypothesis 3.1. If $b(x) \geq 0$ for all $x \in [0, 1]$, $M < 1$ and $y$ is a mild solution of (2.8), then

$$
\eta(1) \int_0^T y_x^2(t, 1) dt \geq 2E_y(0) \left( (1 - \max\{M, K\})T - 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} \right)
$$

for any $T > 0$.

Proof. By (3.18) and Hypothesis 3.1, one has

$$
\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt = \int_0^1 \frac{[x y_x y_t]}{\sigma} t=T dx - \frac{1}{2} \int_{Q_T} x_n b y_x^2 dx dt + \frac{1}{2} \int_{Q_T} \eta y_x^2 dx dt
$$

$$
+ \frac{1}{2} \int_{Q_T} \left( 1 - \frac{x(a_x - b)}{a} \right) \frac{1}{\sigma} y_t^2 dx dt
$$

$$
\geq \int_0^1 \frac{[x y_x y_t]}{\sigma} t=T dx - \frac{M}{2} \int_{Q_T} \eta y_x^2 dx dt + T E_y(0)
$$

$$
- \frac{K}{2} \int_{Q_T} \frac{1}{\sigma} y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \frac{xb}{a} \frac{1}{\sigma} y_t^2 dx dt.
$$

By the positivity of $b$ and (3.27), we have

$$
\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt \geq -2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0) - \frac{M}{2} \int_{Q_T} \eta y_x^2 dx dt
$$

$$
+ T E_y(0) - \frac{K}{2} \int_{Q_T} \frac{1}{\sigma} y_t^2 dx dt
$$

$$
\geq -2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0) + (1 - \max\{M, K\})TE_y(0).
$$

\[ \square \]

Theorem 3.5. Assume Hypothesis 3.1. If $M + K < 1$ and $y$ is a mild solution of (2.8), then

$$
\eta(1) \int_0^T y_x^2(t, 1) dt \geq 2E_y(0) \left( (1 - (M + K))T - 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} \right).
$$

Proof. By Theorem 3.4 one has

$$
\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt \geq \int_0^1 \frac{[x y_x y_t]}{\sigma} t=T dx - \frac{M}{2} \int_{Q_T} \eta y_x^2 dx dt + T E_y(0)
$$

$$
- \frac{K}{2} \int_{Q_T} \frac{1}{\sigma} y_t^2 dx dt + \frac{1}{2} \int_{Q_T} \frac{xb}{a} \frac{1}{\sigma} y_t^2 dx dt.
$$

Since

$$
\left| \frac{1}{2} \int_{Q_T} \frac{xb}{a} \frac{1}{\sigma} y_t^2 dx dt \right| \leq \frac{M}{2} \int_0^1 \frac{y_t^2}{\sigma} dx,
$$

18
we have
\[ \frac{1}{2} \eta(1) \int_0^T y_x^2(t,1)dt \geq -2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0) - \frac{M}{2} T \int_0^1 \eta x^2 dx + TE_y(0) \]
\[ - \frac{K + M}{2} T \int_0^1 \frac{1}{\sigma} y_x^2 dx \]
\[ \geq -2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0) + (1 - (M + K))TE_y(0). \]

We underline that in these two last results we do not use Lemma 3.1 and the proof is simpler. Moreover, since it is not based on Lemma 3.1 on \( b \) we don’t require any differentiability condition.

Following [H], we recall the next definition:

**Definition 3.1.** Problem (2.8) is said to be **observable in time** \( T > 0 \) via the normal derivative at \( x = 1 \) if there exists a constant \( C > 0 \) such that for any \( (y_0, y_T) \in H_0 \) the mild solution \( y \) of (2.8) satisfies
\[ CE_y(0) \leq \int_0^T y_x^2(t,1)dt. \quad (3.37) \]

Moreover, any constant satisfying (3.37) is called **observability constant** for (2.8) in time \( T \).

Setting
\[ C_T := \sup \{ C > 0 : C \text{ satisfies } (3.37) \}, \]
we have that (2.8) is observable if and only if
\[ C_T = \inf_{(y_0, y_T)\neq(0,0)} \frac{\int_0^T y_x^2(t,1)dt}{E_y(0)} > 0. \]

The inverse of \( C_T \), \( c_t := \frac{1}{C_T} \), is called the **cost of observability** (or the cost of control) in time \( T \). Theorems 3.3–3.5 admit the following straightforward corollaries.

**Corollary 3.1.** Assume Hypothesis 3.2. If
\[ \frac{2}{C_{K,b}} \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1, \frac{1}{a(1)} \right\} < T, \]
(3.38)
then (2.8) is observable in time \( T \). Moreover
\[ \frac{2}{\eta(1)} \left( C_{K,b} T - 2 \max \left\{ M^2 \frac{\max_{[0,1]} \eta}{a(1) \min_{[0,1]} \eta}, 1, \frac{1}{a(1)} \right\} \right) \leq C_T. \]

Here \( C_{K,b} \) is the constant defined in (3.32).
Corollary 3.2. Assume Hypothesis 3.1. If \( b(x) \geq 0 \) for all \( x \in [0, 1] \), \( M < 1 \) and
\[
\frac{2}{1 - \max\{M, K\}} \max\left\{1, \frac{1}{a(1)}\right\} < T, \tag{3.39}
\]
then (2.8) is observable in time \( T \). Moreover
\[
\frac{2}{\eta(1)} \left((1 - \max\{M, K\})T - 2 \max\left\{1, \frac{1}{a(1)}\right\}\right) \leq C_T.
\]

Corollary 3.3. Assume Hypothesis 3.1. If \( M + K < 1 \) and
\[
\frac{2}{1 - (M + K)} \max\left\{1, \frac{1}{a(1)}\right\} < T \tag{3.40}
\]
then (2.8) is observable in time \( T \). Moreover
\[
\frac{2}{\eta(1)} \left((1 - (M + K))T - 2 \max\left\{1, \frac{1}{a(1)}\right\}\right) \leq C_T.
\]

3.2 The strongly degenerate case

Now, we consider the case in which \( a \) is strongly degenerate at 0.

Hypothesis 3.3. Hypothesis 2.1 holds, \( a \) is (SD) and
\begin{enumerate}
\item if \( K > 1 \), then \( b \in C^1[0, 1], b(1) > 0 \) and \( b(0) = 0 \);
\item if \( K = 1 \), then Hypothesis 3.2 holds.
\end{enumerate}

Remark 5. Observe that the condition \( \frac{b}{a} \in L^1(0, 1) \) in this case implies that \( b(0) = 0 \). Indeed it is well know that in the strongly degenerate case \( \frac{1}{a} \not\in L^1(0, 1) \) (see [2]). For instance, for the prototypes \( a(x) = x^K \) and \( b(x) = x^h \), then \( h > K - 1 \), so that \( b \) is allowed to be either weakly or strongly degenerate at 0.

A straightforward consequence of the assumption above is the following lemma.

Lemma 3.2. If \( \frac{b}{a} \in L^1(0, 1) \), then \( x\frac{b}{a} \in L^\infty(0, 1) \).

Proof. Since \( a > 0 \) in \((0, 1]\), if \( x\frac{b}{a} \not\in L^\infty(0, 1) \), the lack of boundedness may appear only at \( x = 0 \). So, assume by contradiction that \( x\frac{b}{a} \not\in L^\infty(0, 1) \). Then, for any \( n \in \mathbb{N} \) there exists \( x_n > 0 \) such that
\[
\frac{xb}{a} > n \text{ in } (0, x_n),
\]
which immediately gives a contradiction with the assumption that \( \frac{b}{a} \in L^1(0, 1) \).
We start with the analogous of Theorem 3.2.

**Theorem 3.6.** Assume Hypothesis 3.3 and let \( y \) be a mild solution of (2.8). Then \( y(\cdot, 1) \in L^2(0, T) \) for any \( T > 0 \). Moreover:

- if \( K > 1 \), then

\[
\frac{1}{2} \eta(1)b(1) \int_0^T y_x^2(t, 1) dt = \int_0^1 \left[ \frac{x^2 y_x y_t}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_{Q_T} xgb\eta b_y \frac{y_x^2}{\sigma} dxdt \\
+ \frac{1}{2} \int_{Q_T} (xb + xgb + gb) \eta y_x^2 dx dt \\
+ \frac{1}{2} \int_{Q_T} gb - xg + xgb + gb \frac{b - a_x}{a} \frac{y_x^2}{\sigma} dx dt.
\]

(3.41)

As a consequence,

\[
\eta(1) \int_0^T y_x^2(t, 1) dt \leq C \left( M, K, \| b \|_{L^\infty(0, 1)}, \| b' \|_{L^\infty(0, 1)}, \left\| \frac{b}{a} \right\|_{L^\infty(0, 1)} \right) E_y(0),
\]

(3.42)

were \( M \) is defined in (2.14).

- if \( K = 1 \), then

\[
\frac{1}{2} \eta(1) \int_0^T y_x^2(t, 1) dt = \int_0^1 \left[ \frac{x^2 y_x y_t}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_{Q_T} x^2 \eta b_y b y_x^2 dx dt \\
+ \int_{Q_T} xg y_x^2 dx dt + \frac{1}{2} \int_{Q_T} \left( 2 - \frac{x(a_x - b)}{a} \right) y_x^2 dx dt.
\]

(3.43)

In particular,

\[
\eta(1) \int_0^T y_x^2(t, 1) dt \leq \left( 2(2 + K + M) + 4 \max \left\{ \frac{1}{a(1)}, 1 \right\} \right) E_y(0).
\]

(3.44)

**Proof.** As for Theorem 3.2 it is sufficient to give the proof when \( y \) is a classical solution of (2.8). Now, we distinguish between \( K > 1 \) and \( K = 1 \).

\( K > 1 \):

Multiple the equation of (2.8) by \( \frac{xb y_x}{\sigma} \) using (2.4). Then we get

\[
\frac{1}{2} \int_0^T [xb y_x^2]_{x=0}^1 dt = \int_0^1 \left[ \frac{xb y_x y_t}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_{Q_T} xbn b y_x^2 dx dt - \frac{1}{2} \int_0^T \left[ \frac{xb Y^2}{\sigma} \right]_{x=0}^1 dt \\
+ \frac{1}{2} \int_{Q_T} (xb + b) \eta y_x^2 dx dt + \frac{1}{2} \int_{Q_T} (b + xb + xb \frac{b - a_x}{a}) \frac{y_x^2}{\sigma} dx dt.
\]

21
Moreover, by Lemma 3.2, we find
\[ \frac{x b}{\sigma} y_t \leq \left\| \frac{b}{a} \right\|_{L^\infty(0, 1)} \eta y_t. \]

Hence
\[ -\frac{1}{2} \int_0^T \left[ \frac{x b}{\sigma} y_t \right]_{x=0}^{x=1} dt = 0. \]

Thus
\[ \frac{1}{2} \eta(1)b(1) \int_0^T y_x^2(t, 1) dt = \int_0^1 \left[ \frac{x b y_x}{\sigma} \right]_{t=0}^{t=T} dx - \frac{1}{2} \int_{Q_T} x b \eta y_x^2 dx dt \]
\[ + \frac{1}{2} \int_{Q_T} (x b + b) \eta y_x^2 dx dt + \frac{1}{2} \int_{Q_T} (b + x b + x b - a x) \frac{y_t^2}{\sigma} dx dt. \quad (3.45) \]

Now,
\[ \frac{1}{2} \int_{Q_T} x b \eta b y_x^2 dx dt \leq \frac{1}{2} \left\| b \right\|_{L^\infty(0, 1)} \left\| \frac{b}{a} \right\|_{L^\infty(0, 1)} \int_{Q_T} \eta y_x^2 dx dt \quad (3.46) \]
and
\[ \frac{1}{2} \left| \int_{Q_T} (b + x b + x b - a x) \frac{y_t^2}{\sigma} dx dt \right| \leq \left\| b \right\|_{L^\infty(0, 1)} + \left\| b' \right\|_{L^\infty(0, 1)} \int_{Q_T} \eta y_x^2 dx dt. \quad (3.47) \]

As for the integral \[ \frac{1}{2} \int_{Q_T} (b + x b + x b - a x) \frac{y_t^2}{\sigma} dx dt, \]
proceed as for (3.47). By (1.2), we have
\[ \frac{1}{2} \left| \int_{Q_T} (b + x b + x b - a x) \frac{y_t^2}{\sigma} dx dt \right| \leq \left\| b \right\|_{L^\infty(0, 1)} + \left\| b' \right\|_{L^\infty(0, 1)} \left\| \frac{b}{a} \right\|_{L^\infty(0, 1)} + K \left\| b \right\|_{L^\infty(0, 1)} \int_{Q_T} \eta y_x^2 dx dt. \quad (3.48) \]

Finally, by (2.13),
\[ \left| \int_0^1 x b y_x(\tau, x) y_t(\tau, x) \frac{dx}{\sigma} \right| \leq \frac{1}{2} \left| \int_0^1 \frac{x^2 b^2}{a} y_x^2(\tau, x) dx \right| + \frac{1}{2} \left| \int_0^1 \frac{y_t^2(\tau, x)}{\sigma} dx \right| \]
\[ \leq \frac{M \left\| b \right\|_{L^\infty(0, 1)}}{2} \int_0^1 \eta y_x^2(\tau, x) dx + \frac{1}{2} \int_0^1 \frac{y_t^2(\tau, x)}{\sigma} dx, \quad (3.49) \]
for all \( \tau \in [0, T] \). Hence,
\[ \int_0^1 \left[ x b y_x(\tau, x) y_t(\tau, x) \right]_{t=0}^{t=T} dx 
\leq 2 \max \left\{ M \left\| b \right\|_{L^\infty(0, 1)}, 1 \right\} E_y(0). \quad (3.50) \]
By (3.45)–(3.50), inequality (3.42) holds.

\[ K = 1 : \]

Now, we multiply the equation of (2.8) by \( \frac{x^2 y_x}{\sigma} \) and we integrate by parts over \( Q_T \), obtaining

\[
0 = \int_Q x^2 y_\sigma \frac{t}{x} \left[ x^2 y_x \right]_{x=0}^{x=1} dt - \frac{1}{2} \int_Q \frac{x^2}{a} y_x^2 dx dt,
\]

\[
- \frac{1}{2} \int_Q x^2 \left[ y_x^2 \right]_{x=0}^{x=1} dt + \int_Q \frac{y_x^2}{\sigma} dx dt + \frac{1}{2} \int_Q \left( 2 - \frac{x(a_x - b)}{a} \right) \frac{x^2 y_x}{\sigma} dy_x dx dt.
\]

By (2.13),

\[
\frac{1}{2} \left| \int_Q x^2 y_x^2 dx dt \right| \leq \frac{1}{2} M \int_Q y_x^2 dx dt,
\]

where \( M \) is given in (2.15).

Moreover, by Hypothesis 3.1 and again by (2.13), we have

\[
\frac{1}{2} \int_Q \left( 2 - \frac{x(a_x - b)}{a} \right) \frac{x^2 y_x}{\sigma} dy_x dx dt \leq \frac{1}{2} (2 + M) \int_Q \frac{y_x^2}{\sigma} dx dt.
\]

Now, consider the boundary terms. Thanks to the boundary conditions of \( y \) and (2.14), one can prove

\[
\lim_{x \to 0} x^2 y_x(t, x) = \lim_{x \to 1} x^2 y_x(t, x) = 0
\]

and \( \frac{1}{\sigma(1)} y_{(1)}^2(t, 1) = 0 \), hence

\[
\int_0^T \left[ x^2 y_x^2 \right]_{x=0}^{x=1} dt = 0,
\]

while

\[
\int_0^T \left[ x^2 y_x^2 \right]_{x=0}^{x=1} dt = \int_0^T \eta(1) y_x^2 dt.
\]

Observing that, by (2.13), one has

\[
\left| \int_0^1 \frac{x^2 y_x(\tau, x) y_\tau(\tau, x)}{\sigma} d\tau \right| \leq \int_0^1 \left| \frac{x^2 y_x(\tau, x) y_\tau(\tau, x)}{\sigma} \right| d\tau
\]

\[
\leq \frac{1}{2} \int_0^1 x^4 \sigma y_x^2 dx + \frac{1}{2} \int_0^1 \frac{y_x^2}{\sigma} dx
\]

\[
= \frac{1}{2} \int_0^1 \frac{x^4}{a} y_x^2(\tau, x) dx + \frac{1}{2} \int_0^1 \frac{y_x^2}{\sigma} dx
\]

\[
\leq \frac{1}{2a(1)} \int_0^1 \eta y_x^2(\tau, x) dx + \frac{1}{2} \int_0^1 \frac{y_x^2(\tau, x)}{\sigma} dx
\]

(3.51)
for all $\tau \in [0, T]$. Hence, by Theorem 3.1 we get

$$
\int_0^1 \left[ \frac{x^2 y_x(\tau, x) y_t(\tau, x)}{\sigma} \right]_{t=0}^{T} dx \leq 2 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0). \tag{3.57}
$$

Finally, by (3.51)-(3.57), one has

$$
\eta(1) \int_0^T y^2_x(t, 1) dt \leq 2 \left( 2 + K + M \right) T E_y(0) + 4 \max \left\{ \frac{1}{a(1)}, 1 \right\} E_y(0). \tag{3.59}
$$

In order to get an estimate from below, namely an observability inequality, we consider the function $g$ defined as

$$
g(x) := x^{K-1} e^{\int_1^x \frac{|b|}{a} dy} \int_0^x e^{\int_1^t \frac{|b|}{a} dt} dt \tag{3.58}
$$

and we make the following assumption, which is actually more general than Hypothesis 3.3.

**Remark 6.** The function $g$ is a continuous nonnegative and increasing function on $[0, 1]$, hence $g(x) \leq \max_{[0,1]} g = g(1) = M_g$ for all $x \in [0, 1]$.

**Hypothesis 3.4.** Hypothesis 2.1 holds and $a$ is (SD).

**Theorem 3.7.** Assume Hypothesis 3.4. Then, for any $T > 0$, the mild solution $y$ of (2.8) satisfies

$$
2 \left[ T - 2 \max \left\{ \frac{M_g^2}{a(1)}, 1 \right\} \right] E_y(0) \leq \eta(1) \int_0^T y^2_x(t, 1) dt. \tag{3.59}
$$

**Proof.** We proceed as in Theorem 3.3. Multiplying the equation of (2.8) by $\frac{xg(x)}{\sigma} y_x$, we first obtain

\begin{align*}
0 &= \int_0^1 \left[ \frac{y_t x y_y}{\sigma} \right]_{t=0}^{T} dx + \int_{Q_T} (y^2_x)_x \frac{xg}{\sigma} dx dt - \int_{Q_T} (\eta y_x)xg y_x dx dt \\
&= \int_0^1 \left[ \frac{y_t x y_y}{\sigma} \right]_{t=0}^{T} dx - \frac{1}{2} \int_{Q_T} \left[ y^2_t x \frac{y_y}{\sigma} \right]_{x=0}^{x=1} dx dt + \frac{1}{2} \int_{Q_T} y^2_t x \frac{\sigma}{\sigma} dx dt \\
&+ \frac{1}{2} \int_{Q_T} \frac{y^2_t}{\sigma} dx dt + \frac{1}{2} \int_{Q_T} \frac{y^2_t}{\sigma} \left( \frac{b-a}{a} \right) dx dt \\
&- \frac{1}{2} \int_{Q_T} \frac{b}{a} y x g^2 dx dt - \frac{1}{2} \int_{Q_T} [\eta x g y^2]_{x=0}^{x=1} dx dt + \frac{1}{2} \int_{Q_T} \eta^2_x \left( \frac{b}{a} x g + g + x g_x \right) dx dt.
\end{align*}

24
Then, by (1.2), one has

\[
\frac{\eta(t)}{2} \int_0^T y_x^2(t,1) dt = \int_0^1 \left[ \frac{y(t)g_y}{\sigma} \right]_{t=0}^{t=T} dt - \frac{1}{2} \int_0^T \left[ \frac{y_x^2}{\sigma} \right]_{x=0}^{x=1} dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( g + xg_x - \frac{b}{a}g \right) dx dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( g + xg_x + xg - \frac{xg}{a} \right) dx dt
\]

\[
\geq \int_0^1 \left[ \frac{y(t)g_y}{\sigma} \right]_{t=0}^{t=T} dt - \frac{1}{2} \int_0^T \left[ \frac{y_x^2}{\sigma} \right]_{x=0}^{x=1} dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( g + xg_x - \frac{b}{a}g \right) dx dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( g + xg_x + xg - \frac{xg}{a} \right) dx dt
\]

\[
= \int_0^1 \left[ \frac{y(t)g_y}{\sigma} \right]_{t=0}^{t=T} dt - \frac{1}{2} \int_0^T \left[ \frac{y_x^2}{\sigma} \right]_{x=0}^{x=1} dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( 1 - K \right) g + xg_x - \frac{|b|}{a}xg dx dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( 1 - K \right) g + xg_x - \frac{|b|}{a}xg dx dt
\]

\[
\geq \int_0^1 \left[ \frac{y(t)g_y}{\sigma} \right]_{t=0}^{t=T} dt - \frac{1}{2} \int_0^T \left[ \frac{y_x^2}{\sigma} \right]_{x=0}^{x=1} dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( 1 - K \right) g + xg_x - \frac{|b|}{a}xg dx dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( 1 - K \right) g + xg_x - \frac{|b|}{a}xg dx dt
\]

(3.60)

By definition of \( g \), we have

\( (1 - K)g + xg_x - \frac{|b|}{a}xg = 1; \)

thus (3.60) becomes

\[
\frac{1}{2} \eta(t) \int_0^T y_x^2(t,1) dt \geq \int_0^1 \left[ \frac{y(t)g_y}{\sigma} \right]_{t=0}^{t=T} dt - \frac{1}{2} \int_0^T \left[ \frac{y_x^2}{\sigma} \right]_{x=0}^{x=1} dt + \frac{1}{2} \int_0^T \eta y_x^2 dx dt + \frac{1}{2} \int_0^T \eta y_x^2 \left( 1 - K \right) g + xg_x - \frac{|b|}{a}xg dx dt
\]

(3.61)
Now, it remains to estimate the boundary terms. Proceeding as for (3.26), one has
\[
\left| \int_0^1 \frac{xy(x, \tau) \partial y(x, \tau)}{\sigma} \, dx \right| \leq \int_0^1 \left| \frac{xy(x, \tau) \partial y(x, \tau)}{\sigma} \right| \, dx \leq \frac{1}{2} \int_0^1 \frac{x^2 \partial^2 y^2}{\sigma} \, dx + \frac{1}{2} \int_0^1 \frac{y^2}{\sigma} \, dx
\]
\[
= \frac{1}{2} \int_0^1 \eta \frac{x^2}{\sigma} \partial^2 y^2 (x, \tau) \, dx + \frac{1}{2} \int_0^1 \frac{y^2 (x, \tau)}{\sigma} \, dx
\]
\[
\leq \frac{M^2}{2a(1)} \int_0^1 \eta y^2 (x, \tau) \, dx + \frac{1}{2} \int_0^1 \frac{y^2 (x, \tau)}{\sigma} \, dx
\]
for all \( \tau \in [0, T] \). By Theorem 3.1, we get
\[
\int_0^1 \left[ \frac{xy(x, \tau) \partial y(x, \tau)}{\sigma} \right]_{t=0}^{t=T} \, dx \leq \frac{1}{2} \int_0^1 \eta y^2 (T, x) \, dx + \frac{1}{2} \int_0^1 \frac{y^2 (T, x)}{\sigma} \, dx
\]
\[
+ \frac{1}{2} \frac{M^2}{2a(1)} \int_0^1 \eta y^2 (0, x) \, dx + \frac{1}{2} \int_0^1 \frac{y^2 (0, x)}{\sigma} \, dx
\]
\[
\leq 2 \max \left\{ \frac{M^2}{a(1)} , 1 \right\} E_y (0).
\]
(3.62)

Now, thanks to the boundary conditions, \( \frac{1}{2} \int_0^T \left[ \frac{y^2 (x, \tau)}{\sigma} \right]_{x=1}^{x=1} \, dt = 0 \). In conclusion, we find
\[
\frac{1}{2} \eta (1) \int_0^T y^2 (t, 1) \, dt \geq T E_y (0) - 2 \max \left\{ \frac{M^2}{a(1)} , 1 \right\} E_y (0).
\]
(3.63)

The analogous statements of Corollary 3.1, 3.2 or 3.3 become

**Corollary 3.4.** Assume Hypothesis 3.4. If
\[
2 \max \left\{ \frac{M^2}{a(1)} , 1 \right\} < T,
\]
then (2.8) is observable in time \( T \). Moreover
\[
\frac{2}{\eta (1)} \left( T - 2 \max \left\{ \frac{M^2}{a(1)} , 1 \right\} \right) \leq C T.
\]

### 3.3 Failure of boundary observability

In this subsection we shall prove that boundary observability is no longer true when \( K \geq 2 \) (recall that \( K \) is the constant that appears in (1.2)). For this, it is enough to discuss two examples where as \( a \) we consider the prototype, i.e. \( a(x) = x^K \) with \( K \geq 2 \) and the pure degenerate case \( b \equiv 0 \).
Example 1. Let $K > 2$ and consider the problem

$$
\begin{align*}
&\begin{cases}
    u_{tt} - x^K u_{xx} = 0, \\
    u(t, 1) = u(t, 0) = 0
\end{cases} \\
    &u(0, x) = u^0_T(x), \\
    &u_t(0, x) = u^1_T(x),
\end{align*}
$$

(3.64)

where $u^0_T, u^1_T$ are given smooth functions. By using the standard change of variables (see, for example, [7])

$$
X := \begin{cases}
    \int_x^1 \frac{dy}{y^{K/2}}, & \text{if } t > 0, \\
    1, & \text{if } t = 0,
\end{cases}
$$

**Example 2.** Let $K = 2$ in (3.64). Using the change of variables

$$
X := -\log x, \quad U(t, X) := \frac{1}{\sqrt{x}} u(t, x),
$$

one has that (3.64) can be rewritten as

$$
\begin{align*}
&\begin{cases}
    U_{tt} - U_{XX} + \frac{1}{4} U = 0, \\
    U(t, 0) = 0
\end{cases} \\
    &U(0, X) = U^0_T(X) := e^{\frac{X}{2}} u^0_T(e^{-X}), \\
    &U_t(0, X) = U^1_T(X) := e^{\frac{X}{2}} u^1_T(e^{-X}),
\end{align*}
$$

(3.66)

As before, one can conclude that problem (3.64) is not observable on $[0, T]$. 

\[27\]
4 Null controllability

In this section we study the problem of null controllability for (1.1). More precisely, given \((u_0, u_1) \in L^2_\varpi(0, 1) \times H^{-1}_\varpi(0, 1)\), we look for a control \(f \in L^2(0, T)\) such that the solution of (1.1) satisfies (1.4).

First of all, we give the definition of a solution for (1.1) by transposition: it is formally obtained by re-writing the equation as \(u_t - \sigma(\eta u_x)_x\) thanks to (2.9), multiplying by \(\sigma\) and integrating by parts. Precisely:

**Definition 4.1.** Let \(f \in L^2_{\text{loc}}([0, +\infty))\) and \((u_0, u_1) \in L^2_\varpi(0, 1) \times H^{-1}_\varpi(0, 1)\). We say that \(u\) is a solution by transposition of (1.1) if

\[
u \in C^1([0, +\infty); H^{-1}_\varpi(0, 1)) \cap C([0, +\infty); L^2_\varpi(0, 1))
\]

and for all \(T > 0\)

\[
\langle u_t(T), v^0_T \rangle_{H^{-1}_\varpi(0, 1), H^1_\varpi(0, 1)} - \int_0^1 \frac{1}{\sigma} u(T)v_1^t dx = \langle u_1, v(0) \rangle_{H^{-1}_\varpi(0, 1), H^1_\varpi(0, 1)} - \int_0^1 \frac{1}{\sigma} u_0v_t(0, x) dx + \eta(1) \int_0^T f(t)v_x(t, 1) dt
\]

for all \((v^0_T, v^1_T) \in H^1_\varpi(0, 1) \times L^2_\varpi(0, 1)\), where \(v\) solves the backward problem

\[
\begin{aligned}
v_t - av_{xx} - bv_x &= 0, \quad (t, x) \in (0, +\infty) \times (0, 1), \\
v(t, 1) &= v(t, 0) = 0, \quad t \in (0, +\infty), \\
v(T, x) &= v^0_T(x), \quad x \in (0, 1), \\
v_t(T, x) &= v^1_T(x), \quad x \in (0, 1).
\end{aligned}
\]

(4.68)

Setting \(y(t, x) := v(T-t, x)\), one has that \(y\) satisfies (2.8) with \(y^0_T(x) = v^0_T(x)\) and \(y^1_T(x) = -v^1_T(x)\). Hence, thanks to Theorem 2.1 (and Remark 2), problem (4.68) admits a unique solution

\[
v \in C^1([0, +\infty); L^2_\varpi(0, 1)) \cap C([0, +\infty); H^1_\varpi(0, 1))
\]

which depends continuously on the initial data \(V_T := (v^0_T, v^1_T) \in \mathcal{H}_0\).

By Theorem 3.1 the energy is preserved in our setting, as well, so that the method of transposition done in 1 continues to hold thanks to (3.19) or (3.42), and so there exists a unique solution by transposition \(u \in C^1([0, +\infty); H^{-1}_\varpi(0, 1)) \cap C([0, +\infty); L^2_\varpi(0, 1))\) of (1.1), namely a solution of (4.67).

Now, we are ready to pass to null controllability, recalling that by linearity and reversibility of equation (1.1), null controllability for any initial data \((u_0, u_1)\) is equivalent to exact controllability, see 1. In order to prove that (1.1) is null controllable, let us start with

**Hypothesis 4.1.** Assume...
1. Hypotheses $3.2$ $3.30$ and $3.38$, or
2. Hypotheses $3.1$ $b(x) \geq 0$ for all $x \in [0,1]$, $M < 1$ and $3.39$, or
3. Hypotheses $3.1$ $M + K < 1$ and $3.40$, or
4. Hypothesis $3.3$

Now, consider the bilinear form $\Lambda : H_0 \times H_0 \to \mathbb{R}$ defined as

$$\Lambda(V_T, W_T) := \eta(1) \int_0^T v_x(t,1)w_x(t,1)dt,$$

where $v$ and $w$ are the solutions of (4.68) associated to the final data $V_T := (v^0_T, v^1_T)$ and $W_T := (w^0_T, w^1_T)$, respectively. The following lemma holds.

**Lemma 4.1.** Assume Hypothesis $4.1$. Then, the bilinear form $\Lambda$ is continuous and coercive.

**Proof.** By Theorem $3.1$, $E_v$ and $E_w$ are constant in time and thanks to $3.19$ or $3.42$ or $3.44$, one has that $\Lambda$ is continuous. Indeed, by H"older’s inequality and Corollary $2.1$,

$$|\Lambda(V_T, W_T)| \leq \int_0^T \eta(1) |v_x(t,1)w_x(t,1)| dt$$

$$\leq \left( \eta(1) \int_0^T v^2_x(t,1)dt \right)^{\frac{1}{2}} \left( \eta(1) \int_0^T w^2_x(t,1)dt \right)^{\frac{1}{2}}$$

$$\leq C_T E^{\frac{3}{2}}(T) E^\frac{5}{2}(T)$$

$$\leq \frac{C_T}{4} \left( \int_0^1 \frac{(v^1_T)^2(x)}{\sigma} dx + \max_{x \in [0,1]} \eta \int_0^1 v^2_x(T, x)dx \right)^{\frac{1}{2}} \cdot \left( \int_0^1 \frac{(w^1_T)^2(x)}{\sigma} dx + \max_{x \in [0,1]} \eta \int_0^1 w^2_x(T, x)dx \right)^{\frac{1}{2}}$$

$$\leq C \|(v(T), v_1(T))\|_{H_0} \|(w(T), w_1(T))\|_{H_0} = C \|(v^0_T, v^1_T)\|_{H_0} \|(w^0_T, w^1_T)\|_{H_0}$$

for a positive constant $C$ independent of $(V_T, W_T) \in H_0 \times H_0$. In a similar way, one can prove that $\Lambda$ is coercive. Indeed, by Theorem $3.3$ $3.4$ or $3.7$ for all $V_T \in H_0$, one has

$$\Lambda(V_T, V_T) = \int_0^T \eta(1)v^2_x(t,1)dt \geq C_T E_v(0) = C_T E_v(T) \geq C \|(v^0_T, v^1_T)\|_{H_0},$$

for a positive constant $C$.

Thanks to the properties of the function $\Lambda$ one can prove the null controllability for the original problem (1.1). For this, let us start defining $T_0$ as the lower bound found in Corollaries $3.1$ $3.2$ $3.3$ and $3.4$ which changes according to the different assumptions used therein.
Theorem 4.1. Assume Hypothesis 4.1. Then, for all $T > T_0$ and for every $(u_0, u_1) \in L^2_T(0, 1) \times H^{-1}_T(0, 1)$ there exists a control $f \in L^2(0, T)$ such that the solution of (1.1) satisfies

$$u(T, x) = u_t(T, x) = 0 \text{ for all } x \in (0, 1).$$

Proof. Consider the continuous linear map $L : H_0 \rightarrow \mathbb{R}$ defined as

$$L(V_T) := \langle u_1, v(0) \rangle_{H^{-1}(0, 1), H^1(0, 1)} - \int_0^1 \frac{1}{\sigma} u_0 v_t(0, x) dx$$

for all $V_T \in H_0$. Thanks to Lemma 4.1 and by the Lax-Milgram Theorem, there exists a unique $\bar{V}_T \in H_0$ such that

$$\Lambda(\bar{V}_T, W_T) = -L(W_T), \quad (4.69)$$

for all $W_T \in H_0$.

Now, set $f(t) := \bar{v}_x(t, 1)$, $v$ being the solution of (4.68) with initial data $\bar{V}_T$. Then, by (4.69)

$$\eta(1) \int_0^T f(t) w_x(t, 1) dt = \eta(1) \int_0^T v_x(t, 1) w_x(t, 1) dt = \Lambda(\bar{V}_T, W_T) = -L(W_T)$$

$$= -\langle u_1, w(0) \rangle_{H^{-1}(0, 1), H^1(0, 1)} + \int_0^1 \frac{1}{\sigma} u_0 w_t(0, x) dx,$$

for all $W_T \in H_0$.

Finally, denote by $u$ the solution by transposition of (1.1) associated to the function $f$. Then we have

$$\int_0^T \eta(1) f(t) w_x(t, 1) dt = \langle u_t(T), w^0_T \rangle_{H^{-1}_T(0, 1), H^1_T(0, 1)} - \int_0^1 \frac{1}{\sigma} u(T) w^1_T dx$$

$$- \langle u_1, w(0) \rangle_{H^{-1}(0, 1), H^1(0, 1)} + \int_0^1 \frac{1}{\sigma} u_0 w_t(0, x) dx.$$

By (4.70) and (4.71), it follows that

$$\langle u_t(T), w^0_T \rangle_{H^{-1}_T(0, 1), H^1_T(0, 1)} - \int_0^1 \frac{1}{\sigma} u(T) w^1_T dx = 0$$

for all $(w^0_T, w^1_T) \in H_0$. Hence, we have

$$u(T, x) = u_t(T, x) = 0 \text{ for all } x \in (0, 1),$$

as desired.
