Abstract
For the Stirling numbers of the second kind $S(n, k)$ and the ordered Bell numbers $B(n)$, we prove the identity
\[ \sum_{k=0}^{\lfloor n/2 \rfloor} S(n, 2k)(2k - 1)! = B(n - 1). \]
An analogous identity holds for the sum over odd $k$’s.

1 Introduction
For integers $0 \leq k \leq n$, we denote by $S(n, k)$ the Stirling numbers of the second kind and by $B(n)$ the ordered Bell numbers. These sequences can be found in the On-Line Encyclopedia of Integer Sequences (OEIS) [3] as A008277 and A000670. They are related by
\[ B(n) = \sum_{k=0}^{n} k!S(n, k). \] (1)

In this short note, we will give four different ways to express the ordered Bell numbers as a weighted sum of odd or even Stirling numbers of the second kind, where the mentioned parity refers to the second argument.

Theorem 1. For $n \geq 1$, we have
\[ B(n) = (-1)^{n+1} + 2 \sum_{k=0}^{\lfloor n/2 \rfloor} (2k)!S(n, 2k) = (-1)^n + 2 \sum_{k=0}^{\lfloor n/2 \rfloor} (2k+1)!S(n, 2k+1) \] (2)
\[ = \sum_{k=1}^{\lfloor (n+1)/2 \rfloor} (2k-1)!S(n+1, 2k) = \sum_{k=0}^{\lfloor (n+1)/2 \rfloor} (2k)!S(n+1, 2k+1). \] (3)

We could not find the Identities (3) (respectively (8) below) in the literature. The Identities (2) are direct consequences of known other equations, as explained below.
2 Proof of the Theorem

The formal (exponential) generating functions (gf’s) of $B(n)$ and $S(k, n)$ (for fixed $k$) are given by

$$\sum_{n=0}^{\infty} \frac{x^n}{n!} B(n) = \frac{1}{2 - e^x} =: B(x)$$  \hspace{1cm} (4)

$$\sum_{n=0}^{\infty} \frac{x^n}{n!} S(n, k) = \frac{(e^x - 1)^k}{k!},$$  \hspace{1cm} (5)

see Quaintance and Gould [2]. The following identities are known

$$\sum_{k=0}^{n} (-1)^k k! S(n, k) = (-1)^n$$  \hspace{1cm} (6)

$$\sum_{k=1}^{n} (-1)^k (k - 1)! S(n, k) = \begin{cases} -1, & \text{if } n = 1; \\ 0, & \text{if } n \geq 2, \end{cases}$$  \hspace{1cm} (7)

see Boyadzhiev [1, Appendix A]. Combining identities (1) and (6) gives

$$\sum_{k=0}^{[n/2]} (2k)! S(n, 2k) = \frac{1}{2} (B(n) + (-1)^n)$$

$$\sum_{k=0}^{[n/2]} (2k + 1)! S(n, 2k + 1) = \frac{1}{2} (B(n) - (-1)^n).$$

This shows Equation (2) of Theorem 1.

We show below the following theorem.

**Theorem 2.** Put $H(n) := \sum_{k=1}^{n} (k - 1)! S(n, k)$ for $n \geq 1$. Then

$$H(n) = \begin{cases} 1, & \text{if } n = 1; \\ 2B(n - 1), & \text{if } n \geq 2. \end{cases}$$  \hspace{1cm} (8)

Combining identities (7) and (8) gives, for $n \geq 2$,

$$\sum_{k=1}^{[n/2]} (2k - 1)! S(n, 2k) = \sum_{k=0}^{[n/2]} (2k)! S(n, 2k + 1) = B(n - 1),$$  \hspace{1cm} (9)

and therefore (3) of Theorem 1. It remains to prove (8).

**Proof of Theorem 2.** The gf $H(x)$ of $H(n)$ is given by

$$H(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} \sum_{k=1}^{n} (k - 1)! S(n, k) = \sum_{k=1}^{\infty} \frac{1}{k} (e^x - 1)^k$$

$$= - \log(2 - e^x),$$

where we used (5) and the Taylor series
\[
\log(1 - z) = -\sum_{k=1}^{\infty} \frac{1}{k} z^k \quad \text{for } |z| < 1.
\]
Further, 
\[
G(1) = 2 \quad \text{and} \quad G(n) = H(n) \quad \text{for } n \geq 2,
\]
we get
\[
G(x) := \sum_{n=0}^{\infty} \frac{x^n}{n!} G(n) = x - \log(2 - e^x),
\]
noticing that \(H(1) = 1\). By elementary differentiation rules and (4), it follows that
\[
G'(x) = \frac{2}{e^x - 1} = 2B(x). \quad \text{Hence, by Wilf [5, Formula 2.3.1], we get } H(n) = G(n) = 2B(n - 1) \quad \text{for } n \geq 2. \quad \square
\]

Remark 3. We put \(H_e(n) := \sum_{k=1}^{[n/2]} (2k - 1)! S(n, 2k)\) and \(H_o(n) := \sum_{k=0}^{[n/2]} (2k)! S(n, 2k + 1)\). Using the same tools as in the proof above, we can also show that the corresponding gf’s are given by
\[
\sum_{n=0}^{\infty} \frac{x^n}{n!} H_e(n) = \operatorname{artanh}(e^x - 1) = \frac{1}{2} \log \left( \frac{e^x}{2 - e^x} \right),
\]
\[
\sum_{n=0}^{\infty} \frac{x^n}{n!} H_o(n) = -\frac{1}{2} \log \left( e^x (2 - e^x) \right).
\]

With these gf’s, we can deduce (9) directly, without using (7).

Remark 4. The quantities \(W(n, k) := k! S(n + 1, k + 1)\) are called the Worpitzky numbers, see Vanderfelde [5] (OEIS A130850). With this notation, (9) can be written as \((n \geq 1)\)
\[
\sum_{k=1}^{[n/2]} W(n, 2k) = \sum_{k=0}^{[n/2]} W(n, 2k + 1) = B(n).
\]
