STABILITY AND INSTABILITY RESULTS OF THE KIRCHHOFF PLATE EQUATION WITH DELAY TERMS ON BOUNDARY OR DYNAMICAL BOUNDARY CONTROLS

MOHAMMAD AKIL\textsuperscript{1}, HAIDAR BADAWI\textsuperscript{1}, SERGE NICAISE\textsuperscript{1}, AND ALI WEHBE\textsuperscript{2}

Abstract. In this paper, we consider two models of the Kirchhoff plate equation, the first one with delay terms on the dynamical boundary controls (see system (1.1) below), and the second one where delay terms on the boundary control are added (see system (1.2) below). For the first system, we prove its well-posedness, strong stability, non-exponential stability, and polynomial stability under a multiplier geometric control condition. For the second one, we prove its well-posedness, strong stability, and exponential stability under the same multiplier geometric control condition. Finally, we give some instability examples of system (1.2) for some choices of delays.

Key words and phrases. Kirchhoff plate equation, dynamical control, time delay, strong stability, exponential stability, lack of exponential stability, polynomial stability.
1. Introduction

Let $\Omega \subset \mathbb{R}^2$ be a bounded open set with boundary $\Gamma$ of class $C^4$ consisting of a clamped part $\Gamma_0 \neq \emptyset$ and a rimmed part $\Gamma_1 \neq \emptyset$ such that $\Gamma_0 \cap \Gamma_1 = \emptyset$. In the first part of this paper, we study the stability of a Kirchhoff plate equation with delay terms on the dynamical boundary controls, namely we consider

$$\begin{align*}
\begin{cases}
  u_{tt}(x, t) + \Delta^2 u(x, t) = 0 & \text{in } \Omega \times (0, \infty), \\
  u(x, t) = \partial_n u(x, t) = 0 & \text{on } \Gamma_0 \times (0, \infty), \\
  B_1 u(x, t) + \eta(x, t) = 0 & \text{on } \Gamma_1 \times (0, \infty), \\
  B_2 u(x, t) - \xi(x, t) = 0 & \text{on } \Gamma_1 \times (0, \infty), \\
  \eta_t(x, t) - \partial_\nu u_t(x, t) + \beta_1 \eta(x, t) + \beta_2 \eta(x, t - \tau_1) = 0 & \text{on } \Gamma_1 \times (0, \infty), \\
  \xi_t(x, t) - u_t(x, t) + \gamma_1 \xi(x, t) + \gamma_2 \xi(x, t - \tau_2) = 0 & \text{on } \Gamma_1 \times (0, \infty), \\
  u(x, 0) = u_0(x), \quad u_t(x, 0) = u_1(x) & \text{in } \Omega, \\
  \eta(x, 0) = \eta_0(x), \quad \xi(x, 0) = \xi_0(x) & \text{on } \Gamma_1, \\
  \eta(x, t) = f_0(x, t) & \text{on } \Gamma_1 \times (-\tau_1, 0), \\
  \xi(x, t) = g_0(x, t) & \text{on } \Gamma_1 \times (-\tau_2, 0).
\end{cases}
\end{align*}$$

(1.1)

In the second part of this paper, we study the stability of a Kirchhoff plate equation with delay terms on the boundary controls, by considering:

$$\begin{align*}
\begin{cases}
  u_{tt}(x, t) + \Delta^2 u(x, t) = 0 & \text{in } \Omega \times (0, \infty), \\
  u(x, t) = \partial_n u(x, t) = 0 & \text{on } \Gamma_0 \times (0, \infty), \\
  B_1 u(x, t) = -\beta_1 \partial_\nu u_t(x, t) - \beta_2 \partial_\nu u_t(x, t - \tau_1) & \text{on } \Gamma_1 \times (0, \infty), \\
  B_2 u(x, t) = \gamma_1 u_t(x, t) + \gamma_2 u_t(x, t - \tau_2) & \text{on } \Gamma_1 \times (0, \infty), \\
  u(x, 0) = u_0(x), \quad u_t(x, 0) = u_1(x) & \text{in } \Omega, \\
  u_t(x, t) = f_0(x, t) & \text{on } \Gamma_1 \times (-\tau_1, 0), \\
  \partial_\nu u_t(x, t) = g_0(x, t) & \text{on } \Gamma_1 \times (-\tau_2, 0).
\end{cases}
\end{align*}$$

(1.2)

Here and below, $\beta_1$, $\gamma_1$, $\tau_1$ and $\tau_2$ are positive real numbers, $\beta_2$ and $\gamma_2$ are non-zero real numbers, $\nu = (\nu_1, \nu_2)$ is the unit outward normal vector along $\Gamma$, and $\tau = (-\nu_2, \nu_1)$ is the unit tangent vector along $\Gamma$. The constant $0 < \mu < \frac{1}{2}$ is the Poisson coefficient and the boundary operators $B_1$ and $B_2$ are defined by

$$B_1 f = \Delta f + (1 - \mu) C_1 f$$

and

$$B_2 f = \partial_\nu \Delta f + (1 - \mu) \partial_\nu C_2 f,$$

where

$$C_1 f = 2\nu_1\nu_2 f_{x_1x_2} - \nu_1^2 f_{x_2x_2} - \nu_2^2 f_{x_1x_1}$$

and

$$C_2 f = (\nu_1^2 - \nu_2^2) f_{x_1x_1} - \nu_1\nu_2 (f_{x_1x_1} - f_{x_2x_2}).$$

Moreover, easy computations show that

$$C_1 f = -\partial_\nu^2 f - \partial_\nu \nu_2 f_{x_1} + \partial_\nu \nu_1 f_{x_2}$$

and

$$C_2 f = \partial_\nu f - \partial_{\nu_1} f_{x_1} - \partial_{\nu_2} f_{x_2}.$$ (1.3)

In 1993, Rao in [24] studied the stabilization of the Kirchhoff plate equation with non-linear boundary controls (in the linear case, it corresponds to system (1.2) with $\beta_2 = \gamma_2 = 0$), under a multiplier geometric control condition he established an exponential energy decay rate. Furthermore, in 2005, Rao and Wehbe in [25] studied the stabilization of the Kirchhoff plate equation with dynamical boundary controls (corresponding to system (1.1) with $\beta_2 = \gamma_2 = 0$), under the same multiplier geometric control condition they established a polynomial energy decay rate of order $t^{-1}$.

Time delays appear in several applications such as in physics, chemistry, biology, thermal phenomena not only depending on the present state but also on some past occurrences (see [11, 15]). In the last years, the control of partial differential equations with time delays have become popular among scientists, since in many
cases time delays induce some instabilities see \[7, 8, 9, 10\].

In 2006, Nicaise and Pignotti in [21] studied the multidimensional wave equation with boundary feedback and a delay term at the boundary, by considering the following system:

\[
\begin{cases}
    u_{tt}(x,t) - \Delta u(x,t) = 0 & \text{in } \Omega \times (0, \infty), \\
    u(x,t) = 0 & \text{on } \Gamma_D \times (0, \infty), \\
    \frac{\partial u}{\partial \nu}(x,t) - \mu_1 u_t(x,t) - \mu_2 u_t(x,t - \tau) = 0 & \text{on } \Gamma_N \times (0, \infty), \\
    u(x,0) = u_0(x), \quad u_t(x,0) = u_1(x) & \text{in } \Omega, \\
    u_t(x,t) = f_0(x,t) & \text{on } \Gamma_N \times (-\tau, 0),
\end{cases}
\]

(1.4)

where \( \mu_1 \) and \( \mu_2 \) are positive real numbers, and \( \Omega \) is an open bounded domain of \( \mathbb{R}^n \) with a boundary \( \Gamma \) of class \( C^2 \) and \( \Gamma = \Gamma_D \cup \Gamma_N \), such that \( \overline{\Gamma_D} \cap \overline{\Gamma_N} = \emptyset \). Under the assumption \( \mu_2 < \mu_1 \), an exponential decay is achieved. If this assumption does not hold, they found a sequences of delays \( \{\tau_k\}_k, \tau_k \to 0 \), for which the corresponding solutions have increasing energy. In 2020, Bayili \textit{et al.} in \[5\] studied the multidimensional wave equation with a delay term in the dynamical control, by considering the following system:

\[
\begin{cases}
    u_{tt}(x,t) - \Delta u(x,t) = 0 & \text{in } \Omega \times (0, \infty), \\
    u(x,t) = 0 & \text{on } \Gamma_D \times (0, \infty), \\
    \frac{\partial u}{\partial \nu}(x,t) + \eta(x,t) = 0 & \text{on } \Gamma_N \times (0, \infty), \\
    \eta_t(x,t) - \beta_1 \eta(x,t) + \beta_2 \eta(x,t - \tau) = 0 & \text{on } \Gamma_N \times (0, \infty), \\
    u(x,0) = u_0(x), \quad u_t(x,0) = u_1(x) & \text{in } \Omega, \\
    \eta(x,0) = \eta_0(x) & \text{on } \Gamma_N, \\
    \eta(x,t - \tau) = f_0(x,t - \tau) & \text{on } \Gamma_N \times (0, \tau),
\end{cases}
\]

(1.5)

where \( \beta_1 \) and \( \beta_2 \) are positive real numbers, and \( \Omega \) is an open bounded domain in \( \mathbb{R}^n \) with a lipschitz boundary \( \Gamma = \Gamma_D \cup \Gamma_N \) with \( \text{meas}(\Gamma_D) \neq 0 \) and \( \text{meas}(\Gamma_N) \neq 0 \). Under the assumption \( \beta_2 < \beta_1 \), they showed that the system is not exponentially stable, but they proved that the system has the same decay rate than the one without delay.

But to the best of our knowledge, it seems that there is no result in the existing literature concerning the case of the Kirchhoff plate equation with dynamical boundary controls and time delays (or with boundary controls and time delay). The goal of the present paper is to fill this gap by studying the stability of systems (1.1) and (1.2).

In the first part of this paper, we study the stability of system (1.1). In Subsection 2.1, we prove the well-posedness of our system by using semigroup approach. In Subsection 2.2, following a general criteria of Arendt and Batty, we show the strong stability of our system in the absence of the compactness of the resolvent. In subsection 2.3, we prove that the system (1.1) is not exponentially stable. Next, in Subsection 2.4, by combining the frequency domain approach with a specific multiplier method, we prove under the multiplier geometric control condition (MGC) that the energy of our system decays polynomially with the rate \( t^{-1} \).

In the second part of this paper, we study both stability and instability of system (1.2). In subsection 3.1, we prove the well-posedness and the strong stability of our system. In subsection 3.2, we prove under the same (MGC) condition that system (1.2) is exponentially stable. Finally, in subsection 3.3, if \( |\beta_2| \geq \beta_1 \) and \( |\gamma_2| \geq \gamma_1 \), we give some instability examples of system (1.2) for some particular choices of delays.

Let us finish this introduction with some notation used in the remainder of the paper: The usual norm and semi-norm of the Sobolev space \( H^s(\Omega) \) \((s > 0)\) are denoted by \( \| \cdot \|_{H^s(\Omega)} \) and \( | \cdot |_{H^s(\Omega)} \), respectively. By \( A \lesssim B \), we mean that there exists a constant \( C > 0 \) independent of \( A, B \) and a natural parameter \( n \) such that \( A \leq CB \).
2. Kirchhoff plate equation with delay terms on the dynamical boundary control

2.1. Well-posedness of the system. In this section, we will establish the well-posedness of system (1.1) by using semigroup approach. For this aim, as in [21], we introduce the following auxiliary variables

\begin{align}
  z^1(x, \rho, t) &:= \eta(x, t - \rho \tau_1), \quad x \in \Gamma_1, \, \rho \in (0, 1), \, t > 0, \\
  z^2(x, \rho, t) &:= \xi(x, t - \rho \tau_2), \quad x \in \Gamma_1, \, \rho \in (0, 1), \, t > 0.
\end{align}

Then, system (1.1) becomes

\begin{align}
  u_{tt} + \Delta^2 u &= 0 \quad \text{in } \Omega \times (0, \infty), \\
  u = \partial_{\nu} u &= 0 \quad \text{on } \Gamma_0 \times (0, \infty), \\
  B_1 u + \eta &= 0 \quad \text{on } \Gamma_1 \times (0, \infty), \\
  B_2 u - \xi &= 0 \quad \text{on } \Gamma_1 \times (0, \infty), \\
  \eta_{tt} - \partial_{\nu} u_t + \beta_1 \eta + \beta_2 z^2_1 (\cdot, 1, t) &= 0 \quad \text{on } \Gamma_1 \times (0, \infty), \\
  \xi_{tt} - u_t + \gamma_1 \xi + \gamma_2 z^2_2 (\cdot, 1, t) &= 0 \quad \text{on } \Gamma_1 \times (0, \infty), \\
  \tau_1 z^1_t (\cdot, \rho, t) + z^1_{\rho\rho} (\cdot, \rho, t) &= 0 \quad \text{on } \Gamma_1 \times (0, 1) \times (0, \infty), \\
  \tau_2 z^2_t (\cdot, \rho, t) + z^2_{\rho\rho} (\cdot, \rho, t) &= 0 \quad \text{on } \Gamma_1 \times (0, 1) \times (0, \infty),
\end{align}

with the following initial conditions

\begin{equation}
  \left\{ \begin{array}{l}
    u(\cdot, 0) = u_0 (\cdot), \quad u_t (\cdot, 0) = u_1 (\cdot) \quad \text{in } \Omega, \\
    \eta(\cdot, 0) = \eta_0 (\cdot), \quad \xi(\cdot, 0) = \xi_0 (\cdot) \quad \text{on } \Gamma_1, \\
    z^1 (\cdot, \rho, 0) = f_0 (\cdot, -\rho \tau_1) \quad \text{on } \Gamma_1 \times (0, 1), \\
    z^2 (\cdot, \rho, 0) = g_0 (\cdot, -\rho \tau_2) \quad \text{on } \Gamma_1 \times (0, 1).
  \end{array} \right.
\end{equation}

The energy of system (2.2)-(2.10) is given by

\begin{align}
  E(t) &= \frac{1}{2} \left\{ a(u, u) + \int_{\Omega} |u_t|^2 \, dx + \int_{\Gamma_1} |\eta|^2 \, d\Gamma + \int_{\Gamma_1} |\xi|^2 \, d\Gamma \\
  &\quad \quad + \tau_1 |\beta_2| \int_{\Gamma_1} \int_{0}^{1} |z^1 (\cdot, \rho, t)|^2 \, dp \, d\Gamma + \tau_2 |\gamma_2| \int_{\Gamma_1} \int_{0}^{1} |z^2 (\cdot, \rho, t)|^2 \, dpd\Gamma \right\},
\end{align}

where the sequilinorm form $a : H^2(\Omega) \times H^2(\Omega) \rightarrow \mathbb{C}$ is defined by

\begin{equation}
  a(f, g) = \int_{\Omega} \Delta^2 f \overline{g} \, dx + \int_{\Gamma} \langle B_1 f \overline{\partial_{\nu} g} - B_2 f \overline{g} \rangle \, d\Gamma, \quad \forall f \in H^2(\Omega), \, g \in H^2(\Omega).
\end{equation}

We first recall the following Green’s formula (see [16]):

\begin{equation}
  a(f, g) = \int_{\Omega} \Delta^2 f \overline{g} \, dx + \int_{\Gamma} \langle B_1 f \overline{\partial_{\nu} g} - B_2 f \overline{g} \rangle \, d\Gamma, \quad \forall f \in H^2(\Omega),
\end{equation}

For further purposes, we need a weaker version of it. Indeed as $\mathcal{D}(\Delta^2)$ is dense in $E(\Delta^2, L^2(\Omega)) := \{ f \in H^2(\Omega) \mid \Delta^2 f \in L^2(\Omega) \}$ equipped with its natural norm, we deduce that $f \in E(\Delta^2, L^2(\Omega))$ (see Theorem 5.6 in [20]) satisfies $B_1 f \in H^{-\frac{1}{2}}(\Gamma)$ and $B_2 f \in H^{-\frac{3}{2}}(\Gamma)$ with

\begin{equation}
  a(f, g) = \int_{\Omega} \Delta^2 f \overline{g} \, dx + \langle B_1 f \overline{\partial_{\nu} g} \rangle_{H^{-\frac{1}{2}}(\Gamma), H^{\frac{1}{2}}(\Gamma)} - \langle B_2 f \overline{g} \rangle_{H^{-\frac{3}{2}}(\Gamma), H^{\frac{3}{2}}(\Gamma)}, \quad \forall g \in H^2(\Omega).
\end{equation}

**Lemma 2.1.** Let $U = (u, u_t, \eta, \xi, z^1, z^2)$ be a regular solution of system (2.2)-(2.10). Then, the energy $E(t)$ satisfies the following estimation

\begin{equation}
  \frac{d}{dt} E(t) \leq - (1 - |\beta_2|) \int_{\Gamma_1} |\eta|^2 \, d\Gamma - (1 - |\gamma_2|) \int_{\Gamma_1} |\xi|^2 \, d\Gamma.
\end{equation}

**Proof.** First, multiplying (2.2) by $\overline{\partial_{\nu} u}$, integrating over $\Omega$, using (2.12) and (2.3), then taking the real part, we obtain

\begin{equation}
  \frac{1}{2} \frac{d}{dt} \int_{\Omega} |u_t|^2 + \frac{1}{2} \frac{d}{dt} a(u, u) - \Re \left\{ \int_{\Gamma_1} (B_1 u \overline{\partial_{\nu} u} - B_2 u \overline{u}) \, d\Gamma \right\} = 0.
\end{equation}
Now, from (2.4)-(2.7), we get
\[-\Re \left\{ \int_{\Gamma_1} (B_1 u \partial_\nu \overline{u} - B_2 u \overline{u}) d\Gamma \right\} = \Re \left\{ \int_{\Gamma_1} \eta (\eta_t + \beta_1 \eta + \beta_2 z^1(\cdot, 1, t)) d\Gamma \\
+ \int_{\Gamma_1} \xi (\xi_t + \gamma_1 \xi + \gamma_2 z^2(\cdot, 1, t)) d\Gamma \right\} \]
\[= \frac{1}{2} \frac{d}{dt} \int_{\Gamma_1} |\eta|^2 d\Gamma + \beta_1 \int_{\Gamma_1} |\eta|^2 d\Gamma + \Re \left\{ \beta_2 \int_{\Gamma_1} \eta \overline{z^1(\cdot, 1, t)} d\Gamma \right\} \\
+ \frac{1}{2} \frac{d}{dt} \int_{\Gamma_1} |\xi|^2 d\Gamma + \gamma_1 \int_{\Gamma_1} |\xi|^2 d\Gamma + \Re \left\{ \gamma_2 \int_{\Gamma_1} \xi \overline{z^2(\cdot, 1, t)} d\Gamma \right\} .\]

Inserting the above equation in (2.14), then using Young’s inequality, we obtain
\[\frac{1}{2} \frac{d}{dt} \int_{\Omega} |u_t|^2 + \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{1}{2} \frac{d}{dt} \int_{\Gamma_1} |\eta|^2 d\Gamma \]
\[= -\beta_1 \int_{\Gamma_1} |\eta|^2 d\Gamma - \Re \left\{ \beta_2 \int_{\Gamma_1} \eta z^1(\cdot, 1, t) d\Gamma \right\} - \gamma_1 \int_{\Gamma_1} |\xi|^2 d\Gamma - \Re \left\{ \gamma_2 \int_{\Gamma_1} \xi z^2(\cdot, 1, t) d\Gamma \right\} \]
\[\leq -\beta_1 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{|\beta_2|}{2} \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{|\beta_2|}{2} \int_{\Gamma_1} |z^1(\cdot, 1, t)|^2 d\Gamma \]
\[\leq -\gamma_1 \int_{\Gamma_1} |\xi|^2 d\Gamma + \frac{|\gamma_2|}{2} \int_{\Gamma_1} |\xi|^2 d\Gamma + \frac{|\gamma_2|}{2} \int_{\Gamma_1} |z^2(\cdot, 1, t)|^2 d\Gamma .\]

Multiplying (2.8) and (2.9) by $|\beta_2| \overline{z^1(\cdot, \rho, t)}$ and $|\gamma_2| \overline{z^2(\cdot, \rho, t)}$ respectively, integrating over $\Gamma_1 \times (0, 1)$, using the fact that $z^1(\cdot, 0, t) = \eta$ and $z^2(\cdot, 0, t) = \xi$, then taking the real part, we obtain
\[\frac{\tau_1 |\beta_2|}{2} \int_{\Gamma_1} \int_0^1 |z^1(\cdot, \rho, t)|^2 d\rho d\Gamma = -\frac{|\beta_2|}{2} \int_{\Gamma_1} |z^1(\cdot, 1, t)|^2 d\Gamma + \frac{|\beta_2|}{2} \int_{\Gamma_1} |\eta|^2 d\Gamma \]
and
\[\frac{\tau_2 |\gamma_2|}{2} \int_{\Gamma_1} \int_0^1 |z^2(\cdot, \rho, t)|^2 d\rho d\Gamma = -\frac{|\gamma_2|}{2} \int_{\Gamma_1} |z^2(\cdot, 1, t)|^2 d\Gamma + \frac{|\gamma_2|}{2} \int_{\Gamma_1} |\xi|^2 d\Gamma .\]

Finally, by adding (2.15), (2.16) and (2.17), we obtain the desired result. The proof is thus complete. \qed

In the sequel, we make the following assumptions
\[
\text{(H)} \quad \beta_1, \gamma_1 > 0, \quad \beta_2, \gamma_2 \in \mathbb{R}^+, \quad |\beta_2| < \beta_1 \quad \text{and} \quad |\gamma_2| < \gamma_1 .
\]
Under the hypothesis (H) and from Lemma 2.1, system (2.2)-(2.10) is dissipative in the sense that its energy is non-increasing with respect to time (i.e. $E'(t) \leq 0$). Let us define the Hilbert space $\mathcal{H}$ by
\[\mathcal{H} = H^2_{\Gamma_0}(\Omega) \times L^2(\Omega) \times (L^2(\Gamma_1))^2 \times (L^2(\Gamma_1 \times (0, 1)))^2 ,\]
where
\[H^2_{\Gamma_0}(\Omega) = \{ f \in H^2(\Omega) \mid f = \partial_\nu f = 0 \text{ on } \Gamma_0 \} .\]
The Hilbert space $\mathcal{H}$ is equipped with the following inner product
\[\langle U, U \rangle_{\mathcal{H}} = a(u, u_1) + \int_{\Omega} u \overline{\eta} dx + \int_{\Gamma_1} \eta |\eta| d\Gamma + \int_{\Gamma_1} \xi |\xi_\Gamma| d\Gamma \]
\[+ \tau_1 |\beta_2| \int_{\Gamma_1} \int_0^1 z^1 \overline{z^1} d\rho d\Gamma + \tau_2 |\gamma_2| \int_{\Gamma_1} \int_0^1 z^2 \overline{z^2} d\rho d\Gamma ,\]
where $U = (u, \eta, \xi, z^1, z^2)^T, U_1 = (u_1, \eta_1, \xi_1, z^1_1, z^2_1)^T \in \mathcal{H}$. Now, we define the linear unbounded operator $\mathcal{A} : D(\mathcal{A}) \subset \mathcal{H} \rightarrow \mathcal{H}$ by
\[D(\mathcal{A}) = \left\{ U = (u, \eta, \xi, z^1, z^2)^T \in D_{\Gamma_0}(\Delta^2) \times H^2_{\Gamma_0}(\Omega) \times (L^2(\Gamma_1))^2 \times (L^2(\Gamma_1; H^1(0, 1)))^2 \mid B_1 u = -\eta, \quad B_2 u = \xi, \quad z^1(\cdot, 0) = \eta, \quad z^2(\cdot, 0) = \xi \quad \text{on} \quad \Gamma_1 \right\} .\]
where 
\[ D_{\Gamma_0}(\Delta^2) = \{ f \in H^2_{\Gamma_0}(\Omega) \mid \Delta^2f \in L^2(\Omega), B_1f \in L^2(\Gamma_1), \text{ and } B_2f \in L^2(\Gamma_1) \} \]
and
\[
A = \begin{pmatrix} u \\ v \\ \eta \\ \xi \\ z^1 \\ z^2 \\ -\Delta^2 u \\ \partial_{\nu}v - \beta_1 \eta - \beta_2 z^1(\cdot, 1) \\ v - \gamma_1 \xi - \gamma_2 z^2(\cdot, 1) \\ -\frac{1}{\tau_1} z^1_p \\ -\frac{1}{\tau_2} z^2_p \end{pmatrix}, \quad \forall U = (u, v, \eta, \xi, z^1, z^2)^T \in D(A).
\]

**Remark 2.1.** From the fact that 
\[ 2\Re(u_{x_1 x_1}, \nabla_2 u_{x_2 x_2}) = |u_{x_1 x_1}|^2 + |u_{x_2 x_2}|^2 - |u_{x_1 x_1}|^2, \]
we remark that
\[ |u_{x_1 x_1}|^2 + |u_{x_2 x_2}|^2 \leq 2\mu |u_{x_1 x_1}|^2 + 2(1 - \mu)|u_{x_1 x_1}|^2 \]
consequently, from (2.11), we get
\[ a(u, u) \geq (1 - \mu)|u|_{H^2(\Omega)}^2. \]
Hence the sesquilinear form is coercive on \( H^2(\Omega) \), since \( \Gamma_0 \) is non-empty. On the other hand, from (2.13) (see also Lemma 3.1 and Remark 3.1 in [24]), we remark that
\[
a(f, g) = \int_{\Omega} \Delta^2 f \nabla g dx + \int_{\Gamma_1} (B_1 f \partial_{\nu} \nabla - B_2 \nabla) d\Gamma, \quad \forall f \in D_{\Gamma_0}(\Delta^2), \quad g \in H^2_{\Gamma_0}(\Omega). \]

Now, if \( U = (u, v, \eta, \xi, z^1, z^2)^T \) is regular enough, then system (2.2)-(2.10) can be written as the following first order evolution equation
\[
U_t = AU, \quad U(0) = U_0,
\]
where \( U_0 = (u_0, v_0, \eta_0, \xi_0, f_0(\cdot, -\rho_1), g_0(\cdot, -\rho_2))^T \in \mathcal{H}. \)

**Proposition 2.1.** Under the hypothesis (H), the unbounded linear operator \( A \) is m-dissipative in the energy space \( \mathcal{H} \).

**Proof.** For all \( U = (u, v, \eta, \xi, z^1, z^2)^T \in D(A) \), from (2.18) and (2.20), we have
\[
\Re(AU, U) = \Re a(u, u) - \int_{\Omega} \Delta^2 u \nabla d\Gamma + \int_{\Gamma_1} (\partial_{\nu}v - \beta_1 \eta - \beta_2 z^1(\cdot, 1)) \nabla d\Gamma + \int_{\Gamma_1} (v - \gamma_1 \xi - \gamma_2 z^2(\cdot, 1)) \xi d\Gamma
\]
Using (2.22) and the fact that \( U \in D(A) \), we obtain
\[
\Re(AU, U) = -\beta_1 \int_{\Gamma_1} |\eta|^2 d\Gamma - \Re \left\{ \beta_2 \int_{\Gamma_1} z^1(\cdot, 1) \nabla d\Gamma \right\} - \gamma_1 \int_{\Gamma_1} |\xi|^2 d\Gamma - \Re \left\{ \gamma_2 \int_{\Gamma_1} z^2(\cdot, 1) \xi d\Gamma \right\}
\]
Now, by using Young’s inequality, we get
\[
\begin{align*}
-\Re \left\{ \beta_2 \int_{\Gamma_1} z^1(\cdot, 1) \nabla d\Gamma \right\} &\leq \frac{|\beta_2|}{2} \int_{\Gamma_1} |z^1(\cdot, 1)|^2 d\Gamma + \frac{|\beta_2|}{2} \int_{\Gamma_1} |\eta|^2 d\Gamma, \\
-\Re \left\{ \gamma_2 \int_{\Gamma_1} z^2(\cdot, 1) \xi d\Gamma \right\} &\leq \frac{|\gamma_2|}{2} \int_{\Gamma_1} |z^2(\cdot, 1)|^2 d\Gamma + \frac{|\gamma_2|}{2} \int_{\Gamma_1} |\xi|^2 d\Gamma.
\end{align*}
\]
Inserting (2.25) in (2.24) and using the hypothesis (H), we obtain

\[(2.26) \quad \Re (AU,U)_H \leq - (\beta_1 - |\beta_2|) \int_{\Gamma_1} |\eta|^2 d\Gamma - (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |\xi|^2 d\Gamma \leq 0,\]

which implies that A is dissipative. Now, let us prove that A is maximal. For this aim, if \( F = (f_1, f_2, f_3, f_4, g_1, g_2)^T \in H \), we look for \( U = (u, v, \eta, \xi, z^1, z^2)^T \in D(A) \) unique solution of

\[(2.27) \quad - AU = F.\]

Equivalently, we have the following system

\[(2.28) \quad -v = f_1, \]
\[(2.29) \quad \Delta^2 u = f_2, \]
\[(2.30) \quad -\partial_\nu v + \beta_1 \eta + \beta_2 z^1(\cdot, 1) = f_3, \]
\[(2.31) \quad -v + \gamma_1 \xi + \gamma_2 z^2(\cdot, 1) = f_4, \]
\[(2.32) \quad \frac{1}{\tau_1} z^1_\rho = g_1, \]
\[(2.33) \quad \frac{1}{\tau_2} z^2_\rho = g_2, \]

with the following boundary conditions

\[(2.34) \quad u = \partial_\nu u = 0 \text{ on } \Gamma_0 \text{ and } B_1 u = -\eta, B_2 u = \xi, z^1(\cdot, 0) = \eta, z^2(\cdot, 0) = \xi \text{ on } \Gamma_1.\]

From (2.28) and the fact that \( F \in H \), we get

\[(2.35) \quad v = -f_1 \in H^2_{\Gamma_0}(\Omega).\]

From (2.32), (2.33), (2.34) and the fact that \( F \in H \), we obtain

\[(2.36) \quad z^1_\rho \in L^2(\Gamma_1 \times (0,1)) \text{ and } z^1(\cdot, \rho) = \tau_1 \int_0^\rho g_1(\cdot, s) ds + \eta \]

and

\[(2.37) \quad z^2_\rho \in L^2(\Gamma_1 \times (0,1)) \text{ and } z^2(\cdot, \rho) = \tau_2 \int_0^\rho g_2(\cdot, s) ds + \xi.\]

Consequently, from (2.35), (2.30), (2.31), (2.36), (2.37) and the fact that \( F \in H \), we get

\[(2.38) \quad \eta = \frac{1}{\beta_1 + \beta_2} \left( -\partial_\nu f_1 - \tau_1 \beta_2 \int_0^1 g_1(\cdot, s) ds + f_3 \right) \in L^2(\Gamma_1) \]

and

\[(2.39) \quad \xi = \frac{1}{\gamma_1 + \gamma_2} \left( -f_1 - \tau_2 \gamma_2 \int_0^1 g_2(\cdot, s) ds + f_4 \right) \in L^2(\Gamma_1).\]

Now, from (2.36)-(2.39) and the fact that \( g_1, g_2 \in L^2(\Gamma_1 \times (0,1)) \), we deduce that

\[(2.40) \quad z^1, z^2 \in L^2(\Gamma_1; H^1(0,1)).\]

It follows from (2.29), (2.34), (2.38) and (2.39) that

\[\begin{cases}
\Delta^2 u = f_2 \text{ in } \Omega, \\
u = \partial_\nu u = 0 \text{ on } \Gamma_0, \\
B_1 u = -\frac{1}{\beta_1 + \beta_2} \left( -\partial_\nu f_1 - \tau_1 \beta_2 \int_0^1 g_1(\cdot, s) ds + f_3 \right) \text{ on } \Gamma_1, \\
B_2 u = \frac{1}{\gamma_1 + \gamma_2} \left( -f_1 - \tau_2 \gamma_2 \int_0^1 g_2(\cdot, s) ds + f_4 \right) \text{ on } \Gamma_1.
\end{cases}\]

Let \( \varphi \in H^2_{\Gamma_0}(\Omega) \). Multiplying the first equation in (2.40) by \( \varphi \) and integrating over \( \Omega \), then using Green’s formula, we obtain

\[(2.41) \quad a(u, \varphi) = l(\varphi), \quad \forall \varphi \in H^2_{\Gamma_0}(\Omega),\]
where
\[ l(\varphi) = \int_\Omega f_2 \varphi dx - \frac{1}{\beta_1 + \beta_2} \int_{\Gamma_1} \left( -\partial_\nu f_1 - \tau_1 \beta_2 \int_0^1 g_1(\cdot, s) ds + f_3 \right) \partial_\nu \varphi d\Gamma - \frac{1}{\gamma_1 + \gamma_2} \int_{\Gamma_1} \left( -f_1 - \tau_2 \gamma_2 \int_0^1 g_2(\cdot, s) ds + f_4 \right) \varphi d\Gamma. \]

It is easy to see that, \( a \) is a sesquilinear, continuous and coercive form on \( H^2_{\Gamma_0}(\Omega) \times H^2_{\Gamma_0}(\Omega) \) and \( l \) is an antilinear and continuous form on \( H^2_{\Gamma_0}(\Omega) \). Then, it follows by Lax-Milgram theorem that (2.41) admits a unique solution \( u \in H^2_{\Gamma_0}(\Omega) \). By taking the test function \( \varphi \in D(\Omega) \), we see that the first identity of (2.40) holds in the distributional sense, hence \( \Delta^2 u \in L^2(\Omega) \). Coming back to (2.41), and again applying Greens’s formula (2.13), we find that

\[ B_1 u = -\frac{1}{\beta_1 + \beta_2} \left( -\partial_\nu f_1 - \tau_1 \beta_2 \int_0^1 g_1(\cdot, s) ds + f_3 \right) \quad \text{on} \quad \Gamma_1 \]

and

\[ B_2 u = \frac{1}{\gamma_1 + \gamma_2} \left( f_1 - \tau_2 \gamma_2 \int_0^1 g_2(\cdot, s) ds + f_4 \right) \quad \text{on} \quad \Gamma_1. \]

Further since \( F \in \mathcal{H} \), we deduce that \( u \in D_{\Gamma_0}(\Delta^2) \). Consequently, if we define \( U = (u, v, \eta, \xi, z^1, z^2)^T \) with \( u \in H^2_{\Gamma_0}(\Omega) \) the unique solution of (2.41), \( v = -f_1, \xi \) (resp. \( \eta \)) defined by (2.38) (resp. (2.39)) and \( z^1 \) (resp. \( z^2 \)) defined by (2.36) (resp. (2.37)), \( U \) belongs to \( D(\mathcal{A}) \) is the unique solution of (2.27). Then, \( \mathcal{A} \) is an isomorphism and since \( \rho(\mathcal{A}) \) is open set of \( \mathbb{C} \) (see Theorem 6.7 (Chapter III) in [14]), we easily get \( R(\lambda I - \mathcal{A}) = \mathcal{H} \) for a sufficiently small \( \lambda > 0 \). This, together with the dissipativeness of \( \mathcal{A} \), imply that \( D(\mathcal{A}) \) is dense in \( \mathcal{H} \) and that \( \mathcal{A} \) is m-dissipative in \( \mathcal{H} \) (see Theorems 4.5, 4.6 in [22]). The proof is thus complete. \( \square \)

According to Lumer-Phillips theorem (see [22]), Proposition 2.1 implies that the operator \( \mathcal{A} \) generates a \( C_0 \)-semigroup of contractions \( e^{t\mathcal{A}} \) in \( \mathcal{H} \) which gives the well-posedness of (2.23). Then, we have the following result:

**Theorem 2.1.** For all \( U_0 \in \mathcal{H} \), system (2.23) admits a unique weak solution

\[ U(t) = e^{t\mathcal{A}} U_0 \in C^0([0, \infty), \mathcal{H}). \]

Moreover, if \( U_0 \in D(\mathcal{A}) \), then the system (2.23) admits a unique strong solution

\[ U(t) = e^{t\mathcal{A}} U_0 \in C^0([0, \infty), D(\mathcal{A})) \cap C^1([0, \infty), \mathcal{H}). \]

2.2. **Strong Stability.** In this section, we will prove the strong stability of system (2.2)-(2.10). The main result of this section is the following theorem.

**Theorem 2.2.** Under the hypothesis \( (H) \), the \( C_0 \)-semigroup of contraction \( (e^{t\mathcal{A}})_{t \geq 0} \) is strongly stable in \( \mathcal{H} \); i.e., for all \( U_0 \in \mathcal{H} \), the solution of (2.23) satisfies

\[ \lim_{t \to +\infty} \| e^{t\mathcal{A}} U_0 \|_{\mathcal{H}} = 0. \]

According to Theorem A.2, to prove Theorem 2.2, we need to prove that the operator \( \mathcal{A} \) has no pure imaginary eigenvalues and \( \sigma(\mathcal{A}) \cap i\mathbb{R} \) is countable. The proof of these results is not reduced to the analysis of the point spectrum of \( \mathcal{A} \) on the imaginary axis since its resolvent is not compact. Hence the proof of Theorem 2.2 has been divided into the following two Lemmas.

**Lemma 2.2.** For all \( \lambda \in \mathbb{R}, i\lambda I - \mathcal{A} \) is injective i.e.,

\[ \ker(i\lambda I - \mathcal{A}) = \{0\}. \]

**Proof.** From Proposition 2.1, we have \( 0 \in \rho(\mathcal{A}) \). We still need to show the result for \( \lambda \in \mathbb{R}^+ \). For this aim, suppose that \( \lambda \neq 0 \) and let \( U = (u, v, \eta, \xi, z^1, z^2)^T \in D(\mathcal{A}) \) be such that

\[ \mathcal{A} U = i\lambda U. \]

Equivalently, we have the following system
\begin{align}
(2.43) & \quad v = i\lambda u, \\
(2.44) & \quad -\Delta^2 u = i\lambda v, \\
(2.45) & \quad \partial_\nu v - \beta_1 \eta - \beta_2 z^1(\cdot, 1) = i\lambda \eta, \\
(2.46) & \quad v - \gamma_1 \xi - \gamma_2 z^2(\cdot, 1) = i\lambda \xi, \\
(2.47) & \quad -\frac{1}{\tau_1} z^1_\rho = i\lambda z^1, \\
(2.48) & \quad -\frac{1}{\tau_2} z^2_\rho = i\lambda z^2.
\end{align}

From (2.42) and (H), we get

\[ 0 = \Re (i\lambda \|U\|_H^2) = \Re (AU, U)_H \leq -(\beta_1 - |\beta_2|) \int_{\Gamma_1} |\eta|^2 d\Gamma - (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |\xi|^2 d\Gamma \leq 0. \]

Thus, we have

\[ \eta = \xi = 0 \quad \text{on} \quad \Gamma_1. \]

Using (2.47), (2.48) and the fact that \( z^1(\cdot, 0) = \eta, \) \( z^2(\cdot, 0) = \xi \) on \( \Gamma_1, \) then using (2.49), we obtain

\[ z^1(\cdot, \rho) = \eta e^{-i\lambda \tau_1 \rho} = 0 \quad \text{on} \quad \Gamma_1 \times (0, 1), \]

\[ z^2(\cdot, \rho) = \xi e^{-i\lambda \tau_2 \rho} = 0 \quad \text{on} \quad \Gamma_1 \times (0, 1). \]

From (2.45), (2.46), (2.49), (2.50) and (2.51), we get

\[ v = \partial_\nu v = 0 \quad \text{on} \quad \Gamma_1, \]

consequently, from (2.43) and the fact that \( \lambda \neq 0, \) we obtain

\[ u = \partial_\nu u = 0 \quad \text{on} \quad \Gamma_1. \]

Now, from (2.49) and the fact that \( U \in D(A), \) we get

\[ B_1 u = \Delta u + (1 - \mu)C_1 u = 0 \quad \text{on} \quad \Gamma_1, \]

\[ B_2 u = \partial_\nu \Delta u + (1 - \mu)\partial_\nu C_2 u = 0 \quad \text{on} \quad \Gamma_1. \]

Using (2.53) and the fact that \( \nabla u = \partial_\nu u \nu + \partial_\nu u \nu \) on \( \Gamma_1, \) we obtain

\[ u_{x_1} = u_{x_2} = 0 \quad \text{on} \quad \Gamma_1. \]

Now, from (1.3), (2.53) and (2.56), we get

\[ C_1 u = C_2 u = 0 \quad \text{on} \quad \Gamma_1, \]

consequently, from (2.54) and (2.55), we get

\[ \Delta u = \partial_\nu \Delta u = 0 \quad \text{on} \quad \Gamma_1. \]

Inserting (2.43) in (2.44), we obtain

\[ \begin{cases}
\lambda^2 u - \Delta^2 u = 0 \quad \text{in} \quad \Omega, \\
u = \partial_\nu u = 0 \quad \text{on} \quad \Gamma_0, \\
u = \partial_\nu u = \Delta u = \partial_\nu \Delta u = 0 \quad \text{on} \quad \Gamma_1.
\end{cases} \]

Holmgren uniqueness theorem (see [17]) yields

\[ u = 0 \quad \text{in} \quad \Omega. \]

Finally, from (2.43), (2.49), (2.50), (2.51), and (2.60), we get

\[ U = 0. \]

The proof is thus complete. \( \square \)
Lemma 2.3. Under the hypothesis (H), for all $\lambda \in \mathbb{R}$, we have
\[ R(i\lambda I - A) = \mathcal{H}. \]

Proof. From Proposition 2.1, we have $0 \in \rho(A)$. We still need to show the result for $\lambda \in \mathbb{R}^*$. For this aim, for $F = (f_1, f_2, f_3, f_4, g_1, g_2)^\top \in \mathcal{H}$, we look for $U = (u, v, \eta, \xi, z^1, z^2)^\top \in D(A)$ solution of
\[ (i\lambda I - A)U = F. \]
Equivalently, we have the following system
\[ i\lambda u - v = f_1, \]
\[ i\lambda v + \Delta^2 u = f_2, \]
\[ i\lambda \eta - \partial_\nu v + \beta_1 \eta + \beta_2 z^1(\cdot, 1) = f_3, \]
\[ i\lambda \xi - v + \gamma_1 \xi + \gamma_2 z^2(\cdot, 1) = f_4, \]
\[ i\lambda z^1 + \frac{1}{\tau_1} z_\rho^1 = g_1, \]
\[ i\lambda z^2 + \frac{1}{\tau_2} z_\rho^2 = g_2, \]
with the following boundary conditions
\[ u = \partial_\nu u = 0 \text{ on } \Gamma_0 \text{ and } B_1 u = -\eta, \ B_2 u = \xi, \ z^1(\cdot, 0) = \eta, \ z^2(\cdot, 0) = \xi \text{ on } \Gamma_1. \]
From (2.66), (2.67) and (2.68), we deduce that
\[ z^1(\cdot, \rho) = \eta e^{-i\lambda \tau_1 \rho} + \tau_1 \int_0^\rho g_1(x, s) e^{i\lambda \tau_1(s-\rho)} ds \text{ on } \Gamma_1 \times (0, 1), \]
\[ z^2(\cdot, \rho) = \xi e^{-i\lambda \tau_2 \rho} + \tau_2 \int_0^\rho g_2(x, s) e^{i\lambda \tau_2(s-\rho)} ds \text{ on } \Gamma_1 \times (0, 1). \]
Eliminating $v$, $z^1(\cdot, 1)$ and $z^2(\cdot, 1)$ in (2.64) and (2.65), we get
\[ \eta = C_\lambda (i\lambda \partial_\nu u + F_{i\lambda}) \text{ on } \Gamma_1 \text{ and } \xi = K_\lambda (i\lambda u + G_{i\lambda}) \text{ on } \Gamma_1, \]
where
\[ \begin{cases} 
C_\lambda = \frac{1}{i\lambda + \beta_1 + \beta_2 e^{-i\lambda \tau_1}}, & F_{i\lambda} = -\partial_\nu f_1 - \beta_2 \tau_2 \int_0^1 g_1(\cdot, s) e^{i\lambda \tau_1(s-1)} ds + f_3, \\
K_\lambda = \frac{1}{i\lambda + \gamma_1 + \gamma_2 e^{-i\lambda \tau_1}}, & G_{i\lambda} = -f_1 - \beta_2 \tau_2 \int_0^1 g_2(\cdot, s) e^{i\lambda \tau_2(s-1)} ds + f_4.
\end{cases} \]
It follows from (2.62), (2.63), (2.68) and (2.71) that
\[ \begin{cases} 
-\lambda^2 u + \Delta^2 u = i\lambda f_1 + f_2 \text{ in } \Omega, \\
u = \partial_\nu u = 0 \text{ on } \Gamma_0, \\
\Omega_1 u = -C_\lambda (i\lambda \partial_\nu u + F_{i\lambda}) \text{ on } \Gamma_1, \\
B_2 u = K_\lambda (i\lambda u + G_{i\lambda}) \text{ on } \Gamma_1.
\end{cases} \]
Let $\varphi \in H_{10}^2(\Omega)$. Multiplying the first equation in (2.73) by $\overline{\varphi}$, integrating over $\Omega$, then using Green’s formula, we obtain
\[ b(u, \varphi) = l(\varphi), \quad \forall \varphi \in \mathcal{V} := H_{10}^2(\Omega), \]
where
\[ b(u, \varphi) = b_1(u, \varphi) + b_2(u, \varphi), \]
with
\[ \begin{cases} 
b_1(u, \varphi) = a(u, \varphi), \\
b_2(u, \varphi) = -\lambda^2 \int_\Omega u \varphi dx + i\lambda C_{i\lambda} \int_{\Gamma_1} \partial_\nu u \partial_\nu \overline{\varphi} d\Gamma + i\lambda K_{i\lambda} \int_{\Gamma_1} u \overline{\varphi} d\Gamma.
\end{cases} \]
and
\[(2.76) \quad l(\varphi) = \int_\Omega (i\lambda f_1 + f_2)\overline{\varphi}dx - i\lambda C_{2\lambda} \int_{\Gamma_1} F_{i\lambda} \partial_\nu \overline{\varphi}d\Gamma - i\lambda K_{i\lambda} \int_{\Gamma_1} G_{i\lambda} \overline{\varphi}d\Gamma.\]

Let \(V'\) be the dual space of \(V\). Let us define the following operators
\[(2.77) \quad B : V \to V' \quad \text{and} \quad B_i : V \to V', \quad i \in \{1, 2\},\]
such that
\[(2.78) \quad \begin{cases} (Bu)(\varphi) = b(u, \varphi), & \forall \varphi \in V, \\ (B_i u)(\varphi) = b_i(u, \varphi), & \forall \varphi \in V, \quad i \in \{1, 2\}. \end{cases} \]

We need to prove that the operator \(B\) is an isomorphism. For this aim, we divide the proof into two steps:

**Step 1.** In this step, we prove that the operator \(B_2\) is compact. For this aim, let us define the following Hilbert space
\[H^s_{10}(\Omega) := \{ \varphi \in H^s(\Omega) \mid \varphi = \partial_\nu \varphi = 0 \text{ on } \Gamma_0 \} \text{ with } s \in \left(\frac{3}{2}, 2\right).\]

Now, from (2.75) and a trace theorem, we get
\[|b_2(u, \varphi)| \lesssim \|u\|_{L^2(\Omega)} \|\varphi\|_{H^2(\Omega)} + \|\partial_\nu u\|_{L^2(\Gamma_1)} \|\partial_\nu \varphi\|_{L^2(\Gamma_1)} + \|u\|_{L^2(\Gamma_1)} \|\varphi\|_{L^2(\Gamma_1)} \lesssim \|u\|_{H^s(\Omega)} \|\varphi\|_{H^2(\Omega)},\]

for all \(s \in \left(\frac{3}{2}, 2\right)\). As \(V\) is compactly embedded into \(H^s_{10}(\Omega)\) for any \(s \in \left(\frac{3}{2}, 2\right)\), \(B_2\) is indeed a compact operator.

This compactness property and the fact that \(B_1\) is an isomorphism imply that the operator \(B = B_1 + B_2\) is a Fredholm operator of index zero. Now, following Fredholm alternative, we simply need to prove that the operator \(B\) is injective to obtain that it is an isomorphism.

**Step 2.** In this step, we prove that the operator \(B\) is injective (i.e. \(\ker(B) = \{0\}\)). For this aim, let \(u \in \ker(B)\) which gives
\[b(u, \varphi) = 0, \quad \forall \varphi \in V.\]

Equivalently, we have
\[a(u, \varphi) - \lambda^2 \int_\Omega u \overline{\varphi}dx + i\lambda C_{2\lambda} \int_{\Gamma_1} \partial_\nu u \overline{\varphi}d\Gamma + i\lambda K_{2\lambda} \int_{\Gamma_1} u \overline{\varphi}d\Gamma = 0, \quad \forall \varphi \in V.\]

Thus, we find that
\[\begin{cases} -\lambda^2 u + \Delta^2 u = 0 \text{ in } D'(\Omega), \\ u = \partial_\nu u = 0 \text{ on } \Gamma_0, \\ B_1 u = -i\lambda C_{2\lambda} \partial_\nu u \text{ on } \Gamma_1, \\ B_2 u = i\lambda K_{2\lambda} u \text{ on } \Gamma_1. \end{cases}\]

Therefore, the vector \(U\) defined by
\[U = (u, i\lambda u, i\lambda C_{2\lambda} \partial_\nu u, i\lambda K_{2\lambda} u, i\lambda C_{2\lambda} \partial_\nu u, e^{-i\lambda \gamma_1 \rho}, i\lambda K_{2\lambda} u, e^{-i\lambda \gamma_2 \rho})^T\]
belongs to \(D(A)\) and satisfies
\[i\lambda U - AU = 0,\]
and consequently \(U \in \ker(i\lambda I - A)\). Hence Lemma 2.2 yields \(U = 0\) and consequently \(u = 0\) and \(\ker(B) = \{0\}\).

Steps 1 and 2 guarantee that the operator \(B\) is isomorphism. Furthermore it is easy to see that the operator \(l\) is an antilinear and continuous form on \(V\). Consequently, (2.74) admits a unique solution \(u \in V\). In (2.74), by taking test functions \(\varphi \in D(\Omega)\), we see that the first identity of (2.73) holds in the distributional sense, hence \(\Delta^2 u \in L^2(\Omega)\). Coming back to (2.74), and again applying Green’s formula (2.13), we find that
\[B_1 u = -C_{2\lambda} (i\lambda \partial_\nu u + F_{2\lambda}) \text{ on } \Gamma_1\]
and
\[ B_2u = K_\lambda(i\lambda u + G_\lambda) \] on \( \Gamma_1 \).

Further since \( u, \partial_\nu u, F_\lambda \) and \( G_\lambda \) belong to \( L^2(\Gamma_1) \), we deduce that \( u \in D_{\Gamma_0}(\Delta^2) \). Consequently, if \( u \in V \) is the unique solution of (2.74) and if we define \( \eta \) and \( \xi \) by (2.71) and \( z^1 \) (resp. \( z^2 \)) by (2.69) (resp. (2.70)), we deduce that
\[ U = (u, i\lambda u - f_1, \eta, \xi, z^1, z^2) \]
belongs to \( D(A) \) and is the unique solution of (2.61). The proof is thus complete. \( \square \)

**Proof of Theorem 2.2.** From Lemma 2.2, the operator \( A \) has no pure imaginary eigenvalues (i.e. \( \sigma_p(A) \cap i\mathbb{R} = \emptyset \)). Moreover, from Lemma 2.2 and Lemma 2.3, \( i\lambda I - A \) is bijective for all \( \lambda \in \mathbb{R} \) and since \( A \) is closed, we conclude with the help of the closed graph theorem that \( i\lambda I - A \) is an isomorphism for all \( \lambda \in \mathbb{R} \), hence that \( \sigma(A) \cap i\mathbb{R} = \emptyset \). Therefore, according to Theorem A.2, we get that the \( C_0 \)-semigroup \( (e^{tA})_{t \geq 0} \) is strongly stable. The proof is thus complete. \( \square \)

### 2.3. Lack of exponential stability
In this section, we will prove that the system (2.2)-(2.10) is not exponential stable. Let us start with a technical result.

**Lemma 2.4.** Define the linear unbounded operator \( T : D(T) \hookrightarrow L^2(\Omega) \) by
\[ D(T) = \{ f \in E(\Delta^2, L^2(\Omega)) \cap H^2_{\Gamma_0}(\Omega) \mid B_1f + \partial_\nu f = 0 \text{ on } \Gamma_1 \text{ and } B_2f - f = 0 \text{ on } \Gamma_1 \} \]
and
\[ T \Gamma(T) = \Delta^2 f, \quad \forall f \in D(T). \]

Then, \( T \) is a positive self-adjoint operator with a compact resolvent.

**Proof.** We check that \( T \) is the Friedrichs extension of the sesquilinear, symmetric and coercive form
\[ \bar{a}(f, g) = a(f, g) + \int_{\Gamma_1} (\partial_\nu f \partial_\nu \overline{g} + f \overline{\partial_\nu g}) d\Gamma, \]
defined in \( H^2_{\Gamma_0}(\Omega) \times H^2_{\Gamma_0}(\Omega) \). Indeed, by Friedrichs extension Theorem, we can write
\[ D(T) = \{ f \in H^2_{\Gamma_0}(\Omega) \mid \exists \Gamma f \in L^2(\Omega) \text{ such that } \bar{a}(f, g) = (\Gamma f, g), \quad \forall g \in H^2_{\Gamma_0}(\Omega) \} \]
and
\[ T \Gamma(T) = \Gamma T, \quad \forall f \in D(T). \]

We now need to show that this operator \( T \) coincides with the one defined by (2.79)-(2.80). For that purpose, let us denote by \( \bar{D}(T) \) the right-hand side of (2.79). By Green’s formula (2.13), we directly see that \( \bar{D}(T) \subseteq D(T) \) and that for \( f \in \bar{D}(T), T \Gamma(T) \) is indeed given by (2.80). Let us then prove the converse inclusion. For this aim, let \( f \in D(T) \), then we have
\[ \Delta^2 f = \Gamma f \text{ in } D'(\Omega). \]

Hence \( f \) belongs to \( E(\Delta^2, L^2(\Omega)) \) and using Green’s formula (2.13), we obtain
\[ B_1f = -\partial_\nu f \text{ and } B_2f = f. \]

This proves that \( D(T) = \bar{D}(T) \). Finally as \( H^2_{\Gamma_0}(\Omega) \) is compactly embedded in \( L^2(\Omega) \), \( T \) has clearly a compact resolvent. The proof is thus complete. \( \square \)

The main result of this section is the following theorem.

**Theorem 2.3.** The \( C_0 \)-semigroup \( (e^{tA})_{t \geq 0} \) is not uniformly stable in the energy space \( \mathcal{H} \).

**Proof.** According to Theorem A.3 due to Huang [13] and Prüss [23], it is sufficient to show that the resolvent of \( A \) is not uniformly bounded on the imaginary axis. In other words, it is enough to show the existence of a positive real number \( M \) and some sequences \( \lambda_n \in i\mathbb{R}, U_n = (u_n, v_n, \eta_n, \xi_n, z_1^n, z_2^n)^\top \in D(A) \) and \( F_n = (f_{1n}, f_{2n}, f_{3n}, f_{4n}, f_{5n}, f_{6n})^\top \in \mathcal{H} \), where \( n \in \mathbb{N} \) such that
\[ \lambda_n I - A)U_n = F_n, \forall n \in \mathbb{N}, \]
\[ \|U_n\|_\mathcal{H} \geq M, \forall n \in \mathbb{N}, \]
\[ (\lambda_n I - A)U_n = F_n, \forall n \in \mathbb{N}, \]
\[ \|U_n\|_\mathcal{H} \geq M, \forall n \in \mathbb{N}, \]
From Lemma 2.4, we can consider the sequence of eigenfunctions \((\varphi_n)_{n \in \mathbb{N}}\) that form an orthonormal basis of \(L^2(\Omega)\) of the operator \(T\) corresponding to the eigenvalues \((\mu_n^4)_{n \in \mathbb{N}}\) such that \(\mu_n^4\) tends to infinity as \(n\) goes to infinity. Consequently for all \(n \in \mathbb{N}\), they satisfy

\[
\begin{align*}
\Delta^2 \varphi_n &= \mu_n^4 \varphi_n \quad \text{in } \Omega, \\
\varphi_n &= \partial_{\nu} \varphi_n = 0 \quad \text{on } \Gamma_0, \\
\mathcal{B}_1 \varphi_n + \partial_{\nu} \varphi_n &= 0 \quad \text{on } \Gamma_1, \\
\mathcal{B}_2 \varphi_n - \varphi_n &= 0 \quad \text{on } \Gamma_1,
\end{align*}
\]

(2.84)

with

\[
\|\varphi_n\|_{L^2(\Omega)} = 1.
\]

(2.85)

Now, let us choose

\[
\begin{align*}
\lambda_n &= i \mu_n^2, \quad u_n = \varphi_n, \quad \nu_n = \varphi_n, \quad \eta_n = \frac{1}{\lambda_n} \partial_{\nu} \varphi_n, \quad \xi_n = \frac{\varphi_n}{\lambda_n}, \\
z_n^1(\cdot, \cdot) &= \eta_n e^{-i \mu_n^2 \tau_1 \rho} \quad \text{and} \quad z_n^2(\cdot, \cdot) = \xi_n e^{-i \mu_n^2 \tau_2 \rho}.
\end{align*}
\]

(2.86)

It is easy to see that

\[
\begin{align*}
z_n^1(\cdot, 0) &= \eta_n = -\mathcal{B}_1 u_n \quad \text{on } \Gamma_1, \\
z_n^2(\cdot, 0) &= \xi_n = -\mathcal{B}_2 u_n \quad \text{on } \Gamma_1.
\end{align*}
\]

(2.87)

(2.88)

Thus

\[
U_n = \left( \frac{\varphi_n}{\lambda_n}, \varphi_n, \frac{\varphi_n}{\lambda_n}, \frac{\varphi_n}{\lambda_n}, \eta_n e^{-i \mu_n^2 \tau_1 \rho}, \xi_n e^{-i \mu_n^2 \tau_2 \rho} \right) \trans
\]

(2.89)

belongs to \(D(A)\) and is a solution of (2.81) with

\[
F_n = (0, 0, f_{3,n}, f_{4,n}, 0, 0) \trans, \quad f_{3,n} = \frac{\beta_1 + \beta_2 e^{-i \mu_n^2 \tau_1}}{i \mu_n^2} \partial_{\nu} \varphi_n \quad \text{and} \quad f_{4,n} = \frac{\gamma_1 + \gamma_2 e^{-i \mu_n^2 \tau_2}}{i \mu_n^2} \varphi_n.
\]

(2.90)

Now, we have

\[
\|U_n\|_H^2 \geq \|\varphi_n\|_{L^2(\Omega)}^2 = 1, \quad \forall n \in \mathbb{N},
\]

which means that (2.82) holds with \(M = 1\). Moreover, we have

\[
\begin{align*}
&\|F_n\|_H^2 = \|f_{3,n}\|_{L^2(\Gamma_1)}^2 + \|f_{4,n}\|_{L^2(\Gamma_1)}^2 \\
&\leq \left( \frac{\beta_1 + |\beta_2|^2}{\mu_n^4} \right) \|\partial_{\nu} \varphi_n\|_{L^2(\Gamma_1)}^2 + \left( \frac{\gamma_1 + |\gamma_2|^2}{\mu_n^4} \right) \|\varphi_n\|_{L^2(\Gamma_1)}^2 \\
&\lesssim \frac{1}{\mu_n^4} \left( \|\partial_{\nu} \varphi_n\|_{L^2(\Gamma_1)}^2 + \|\varphi_n\|_{L^2(\Gamma_1)}^2 \right).
\end{align*}
\]

(2.91)

By using the trace theorem of interpolation type (see Theorem 1.4.4 in [19] and Theorem 1.5.1.10 in [12]), we obtain

\[
\|\partial_{\nu} \varphi_n\|_{L^2(\Gamma_1)}^2 \lesssim \|\varphi_n\|_{H^2(\Omega)} \|\varphi_n\|_{H^1(\Omega)},
\]

(2.92)

\[
\|\varphi_n\|_{L^2(\Gamma_1)}^2 \lesssim \|\varphi_n\|_{H^1(\Omega)} \|\varphi_n\|_{L^2(\Omega)}.
\]

(2.93)

Now, it follows from Theorem 4.17 in [1] that

\[
\|\varphi_n\|_{H^1(\Omega)} \lesssim \|\varphi_n\|_{H^2(\Omega)}^{\frac{1}{2}} \|\varphi_n\|_{L^2(\Omega)}^{\frac{1}{2}}.
\]

(2.94)

Inserting the above inequality in (2.92) and (2.93), we get

\[
\|\partial_{\nu} \varphi_n\|_{L^2(\Gamma_1)}^2 \lesssim \|\varphi_n\|_{H^2(\Omega)} \|\varphi_n\|_{L^2(\Omega)}^{\frac{1}{2}}.
\]

(2.95)

\[
\|\varphi_n\|_{L^2(\Gamma_1)}^2 \lesssim \|\varphi_n\|_{H^2(\Omega)} \|\varphi_n\|_{L^2(\Omega)}^{\frac{1}{2}}.
\]
Now, we notice that
\[
\tilde{a}(\varphi_n, \varphi_n) = \left( a(\varphi_n, \varphi_n) + \int_{\Gamma_1} |\partial_\nu \varphi_n|^2 d\Gamma + \int_{\Gamma_2} |\varphi_n|^2 d\Gamma \right) \geq \mu_n^2 \| \varphi_n \|_{L^2(\Omega)} = \mu_n^2.
\]
Since the norm defined on the left-hand side of the above equation is equivalent to the usual norm of $H^2(\Omega)$, then we get
\[
\| \varphi_n \|_{H^2(\Omega)} \lesssim \mu_n^2.
\]
Inserting the above inequality and (2.85) in (2.94) and (2.95), we obtain
\[
\| \partial_\nu \varphi_n \|_{L^2(\Gamma_1)} \lesssim |\mu_n|^3,
\]
(2.97)
\[
\| \varphi_n \|_{L^2(\Gamma_1)} \lesssim |\mu_n|.
\]
Finally, from the above inequalities and (2.91), we obtain
\[
\| F_n \|_{L^2(\Omega)} \lesssim \frac{|\mu_n|^3 + |\mu_n|}{\mu_n^2} \to 0 \quad \text{as} \quad n \to \infty.
\]
The proof is thus complete. \( \square \)

2.4. **Polynomial stability.** In this section, we will prove the polynomial stability of system (2.2)-(2.10). The main result of this section is the following theorem.

**Theorem 2.4.** Under the hypothesis (H) and the multiplier geometric control condition MGC (see Definition A.5), for all $U_0 \in D(A)$, there exists a constant $C > 0$ independent of $U_0$ such that the energy of system (2.2)-(2.10) satisfies the following estimation
\[
E(t) \leq \frac{C}{t} \| U_0 \|_{D(A)}^2, \quad \forall t > 0.
\]
According to Theorem A.4, to prove Theorem 2.4, we need to prove the following two conditions
\[
i \mathbb{R} \subset \rho(A)
\]
and
\[
\limsup_{\lambda \in \mathbb{R}, |\lambda| \to \infty} \frac{1}{\lambda^2} \| (i\lambda I - A)^{-1} \|_{L(\mathcal{H})} < \infty.
\]
As condition (2.98) was checked in Subsection 2.2, we only need to prove the second condition. This condition (2.99) is proved by a contradiction argument. For this purpose, suppose that (2.99) is false, then there exists \{(\lambda_n, U_n := (u_n, v_n, \eta_n, z_n^1, z_n^2)^T) \}_{n \geq 1} \subset \mathbb{R}^* \times D(A)$ with
\[
|\lambda_n| \to \infty \quad \text{as} \quad n \to \infty \quad \text{and} \quad \| U_n \|_{\mathcal{H}} = \| (u_n, v_n, \eta_n, z_n^1, z_n^2)^T \|_{\mathcal{H}} = 1, \forall n \in \mathbb{N},
\]
such that
\[
(\lambda_n)^2 (i\lambda_n I - A)U_n = F_n := (f_1, f_2, f_3, f_4, g_{1,n}, g_{2,n})^T \to 0 \quad \text{in} \quad \mathcal{H} \quad \text{as} \quad n \to \infty.
\]
For simplicity, we now drop the index $n$. Equivalently, from (2.101), we have
\[
i \lambda u - v = \lambda^{-2} f_1, \quad f_1 \to 0 \quad \text{in} \quad H^2_0(\Omega),
\]
(2.102)\[
i \lambda v + \Delta^2 u = \lambda^{-2} f_2, \quad f_2 \to 0 \quad \text{in} \quad L^2(\Omega),
\]
(2.103)\[
i \lambda \eta - \partial_\nu v + \beta_1 \eta + \beta_2 z^1 \in (1) = \lambda^{-2} f_3, \quad f_3 \to 0 \quad \text{in} \quad L^2(\Gamma_1),
\]
(2.104)\[
i \lambda \xi - v + \gamma_1 \xi + \gamma_2 z^2 \in (1) = \lambda^{-2} f_4, \quad f_4 \to 0 \quad \text{in} \quad L^2(\Gamma_1),
\]
(2.105)\[
i \lambda z^1 + \frac{1}{\tau_1} z^1 = \lambda^{-2} g_1, \quad g_1 \to 0 \quad \text{in} \quad L^2(\Gamma_1 \times (0,1)),
\]
(2.106)\[
i \lambda z^2 + \frac{1}{\tau_2} z^2 = \lambda^{-2} g_2, \quad g_2 \to 0 \quad \text{in} \quad L^2(\Gamma_1 \times (0,1)).
\]
(2.107)
Here we will check the condition (2.99) by finding a contradiction with (2.100) by showing $\| U \|_{\mathcal{H}} = o(1)$. For clarity, we divide the proof into several Lemmas.
Lemma 2.5. Under the hypothesis (H), the solution $U = (u, v, \eta, \xi, z^1, z^2)^\top \in D(A)$ of (2.102)-(2.107) satisfies the following estimations

$$
\int_{\Gamma_1} |\eta|^2 d\Gamma = o(\lambda^{-2}), \quad \int_{\Gamma_1} |\xi|^2 d\Gamma = o(\lambda^{-2}), \quad \int_{\Gamma_1} |B_1 u|^2 d\Gamma = o(\lambda^{-2}) \quad \text{and} \quad \int_{\Gamma_1} |B_2 u|^2 d\Gamma = o(\lambda^{-2}).
$$

**Proof.** First, taking the inner product of (2.101) with $U$ in $\mathcal{H}$ and using (2.26), we get

$$(\beta_1 - |\beta_2|) \int_{\Gamma_1} |\eta|^2 d\Gamma + (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |\xi|^2 d\Gamma \leq -\Re(A U, U)_{\mathcal{H}} = \frac{1}{\lambda^2} \Re(F, U)_{\mathcal{H}} \leq \frac{1}{\lambda^2} \|F\|_{\mathcal{H}}\|U\|_{\mathcal{H}},$$

from the hypothesis (H), we notice that

$$\beta_1 - |\beta_2| > 0 \quad \text{and} \quad \gamma_1 - |\gamma_2| > 0,$$

using the fact that $\|F\|_{\mathcal{H}} = o(1)$ and $\|U\|_{\mathcal{H}} = 1$, we obtain the first two estimations in (2.108). The last two estimations in (2.108) directly follows from the first two estimations in (2.108) and the fact that $B_1 u = -\eta$, $B_2 u = \xi$ on $\Gamma_1$.

Lemma 2.6. Under the hypothesis (H), the solution $U = (u, v, \eta, \xi, z^1, z^2)^\top \in D(A)$ of (2.102)-(2.107) satisfies the following estimations

$$
\int_{\Gamma_1} \int_0^1 |z^1|^2 d\rho d\Gamma = o(\lambda^{-2}) \quad \text{and} \quad \int_{\Gamma_1} |z^1(\cdot, 1)|^2 d\Gamma = o(\lambda^{-2}),
$$

$$
\int_{\Gamma_1} \int_0^1 |z^2|^2 d\rho d\Gamma = o(\lambda^{-2}) \quad \text{and} \quad \int_{\Gamma_1} |z^2(\cdot, 1)|^2 d\Gamma = o(\lambda^{-2}).
$$

**Proof.** First, from (2.106) and the fact that $z^1(\cdot, 0) = \eta(\cdot)$ on $\Gamma_1$, we obtain

$$z^1(\cdot, \rho) = \eta e^{-i\lambda \tau_1 \rho} + \frac{\tau_1}{\lambda^2} \int_0^\rho g_1(\cdot, s)e^{i\lambda \tau_1 (s-\rho)} ds \quad \text{on} \quad \Gamma_1 \times (0, 1).$$

From (2.111), Cauchy-Schwarz inequality and the fact that $\rho \in (0, 1)$, we get

$$
\int_{\Gamma_1} \int_0^1 |z^1|^2 d\rho d\Gamma \leq 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{2(\tau_1)^2}{\lambda^4} \int_{\Gamma_1} \left( \int_0^\rho |g_1(\cdot, s)| ds \right)^2 d\rho d\Gamma
\leq 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{2(\tau_1)^2}{\lambda^4} \int_{\Gamma_1} \int_0^1 \rho \int_0^\rho |g_1(\cdot, s)|^2 ds d\rho d\Gamma
\leq 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{2(\tau_1)^2}{\lambda^4} \left( \int_0^1 \rho d\rho \right) \int_{\Gamma_1} \int_0^1 |g_1(\cdot, s)|^2 ds d\Gamma
= 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{(\tau_1)^2}{\lambda^4} \int_{\Gamma_1} \int_0^1 |g_1(\cdot, s)|^2 ds d\Gamma.
$$

The above inequality, (2.108) and the fact that $g_1 \to 0$ in $L^2(\Gamma_1 \times (0, 1))$ lead to the first estimation in (2.109). Now, from (2.111), we deduce that

$$z^1(\cdot, 1) = \eta e^{-i\lambda \tau_1} + \frac{\tau_1}{\lambda^2} \int_0^1 g_1(\cdot, s)e^{i\lambda \tau_1 (s-1)} ds \quad \text{on} \quad \Gamma_1,$$

consequently, by using Cauchy-Schwarz inequality, we get

$$
\int_{\Gamma_1} |z^1(\cdot, 1)|^2 d\Gamma \leq 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{2(\tau_1)^2}{\lambda^4} \int_{\Gamma_1} \left( \int_0^1 |g_1(\cdot, s)| ds \right)^2 d\Gamma
\leq 2 \int_{\Gamma_1} |\eta|^2 d\Gamma + \frac{2(\tau_1)^2}{\lambda^4} \int_{\Gamma_1} \int_0^1 |g_1(\cdot, s)|^2 ds d\Gamma.
$$

Therefore, from the above inequality, (2.108) and the fact that $g_1 \to 0$ in $L^2(\Gamma_1 \times (0, 1))$, we get the second estimation in (2.109). The same argument as before yielding (2.110), the proof is complete.
Lemma 2.7. Under the hypothesis (H), the solution \( U = (u, v, \eta, \xi, z, z^2)^\top \in D(A) \) of (2.102)-(2.107) satisfies the following estimations

\[
(2.112) \quad \int_{\Gamma_1} |\partial_\nu u|^2 d\Gamma = o(\lambda^{-2}) \quad \text{and} \quad \int_{\Gamma_1} |u|^2 d\Gamma = o(\lambda^{-2}).
\]

Proof. First, inserting (2.102) in (2.104), we obtain

\[
i\lambda \partial_\nu u = \frac{1}{\lambda^2} (\partial_\nu f_1 - f_3) + (i\lambda + \beta_1) \eta + \beta_2 z^2(\cdot, 1) \quad \text{on} \quad \Gamma_1.
\]

From the above equation, we get

\[
(2.113) \quad \int_{\Gamma_1} |\partial_\nu u|^2 d\Gamma \leq \frac{1}{\lambda^4} \int_{\Gamma_1} (|\partial_\nu f_1|^2 + |f_3|^2) d\Gamma + (\lambda^2 + \beta_1^2)\int_{\Gamma_1} |\eta|^2 d\Gamma + \beta_2^2 \int_{\Gamma_1} |z^2(\cdot, 1)|^2 d\Gamma.
\]

Using a trace theorem and the fact that \( a(f_1, f_1) = o(1) \), we get

\[
\int_{\Gamma_1} |\partial_\nu f_1|^2 d\Gamma \leq \|f_1\|^2_{H^2(\Omega)} \leq a(f_1, f_1) = o(1).
\]

Thus, from the above estimation, (2.108), (2.109), (2.113), and the fact that \( f_3 \to 0 \) in \( L^2(\Gamma_1) \), we get the first estimation in (2.112). Now, inserting (2.102) in (2.105), we obtain

\[
i\lambda u = \frac{1}{\lambda^2} (f_1 - f_4) + (i\lambda + \gamma_1) \xi + \gamma_2 z^2(\cdot, 1) \quad \text{on} \quad \Gamma_1.
\]

From the above equation, we deduce that

\[
(2.114) \quad \int_{\Gamma_1} |\lambda u|^2 d\Gamma \leq \frac{1}{\lambda^4} \int_{\Gamma_1} (|f_1|^2 + |f_4|^2) d\Gamma + (\lambda^2 + \gamma_1^2)\int_{\Gamma_1} |\xi|^2 d\Gamma + \gamma_2^2 \int_{\Gamma_1} |z^2(\cdot, 1)|^2 d\Gamma
\]

Again by a trace theorem and the fact that \( a(f_1, f_1) = o(1) \), we get

\[
\int_{\Gamma_1} |f_1|^2 d\Gamma \leq \|f_1\|^2_{H^2(\Omega)} \leq a(f_1, f_1) = o(1).
\]

Finally, from the above estimation, (2.108), (2.110), (2.114) and the fact that \( f_4 \to 0 \) in \( L^2(\Gamma_1) \), we obtain the second estimation in (2.112). The proof is thus complete. \( \square \)

Lemma 2.8. Under the hypotheses (H) and (A.3), for all \( u \in D_{\Gamma_0}(\Delta^2) \), we have

\[
(2.115) \quad -\Re \left\{ \int_\Omega \Delta^2 u (h \cdot \nabla \overline{\nu}) dx \right\} \leq -\frac{1}{2} a(u, u) + \frac{\varepsilon_1 R^2}{2} \int_{\Gamma_1} |B_2 u|^2 d\Gamma + \frac{\varepsilon_2 R^2}{2} \int_{\Gamma_1} |B_1 u|^2 d\Gamma,
\]

where \( R = \|h\|_{L^\infty(\Omega)} \) and \( \varepsilon_1, \varepsilon_2 \) are positive constants explicitly given below.

Proof. In this proof, we follow the arguments of the proof of Lemma 3.1 in [24] and Lemma 3.1 in [25]. First, we assume that \( B_1 u = \Delta u + (1 - \mu) C_1 u \in H^2(\Gamma_1) \) and \( B_2 u = \partial_\nu \Delta u + (1 - \mu) \partial_\nu C_2 u \in H^2(\Gamma_1) \), then as \( u \in D_{\Gamma_0}(\Delta^2) \) we get \( u \in H^4(\Omega) \). Now, by the identity (3.5) in [24] (see also [16], [25] and [2]), we get

\[
(2.116) \quad -\Re \left\{ \int_\Omega \Delta^2 u (h \cdot \nabla \overline{\nu}) dx \right\} = -a(u, u) - \Re \left\{ \int_{\Gamma} (\partial_\nu \Delta u + (1 - \mu) \partial_\nu C_2 u) (h \cdot \nabla \overline{\nu}) d\Gamma \right\}
\]

where

\[
c(u, u) = |u_{x_1, x_1}|^2 + |u_{x_2, x_2}|^2 + 2\mu \Re (u_{x_1, x_1} \overline{u_{x_2, x_2}}) + 2(1 - \mu)|u_{x_1, x_2}|^2.
\]

From (2.21), we deduce that

\[
(2.117) \quad c(u, u) \geq (1 - \mu) d(u, u) \geq 0,
\]

where

\[
d(u, u) = |u_{x_1, x_1}|^2 + |u_{x_2, x_2}|^2 + 2|u_{x_1, x_2}|^2.
\]
Now, since \( u = \partial_{\nu} u = 0 \) on \( \Gamma_0 \), then using the identities (3.5) and (3.6) in [25], we have
\[
(2.118) \quad \nabla u = 0, \quad \mathcal{C}_1 u = 0, \quad \partial_{\nu}(h \cdot \nabla u) = (h \cdot \nu) \Delta u, \quad c(u, u) = |u|^2 \quad \text{on } \Gamma_0,
\]
where \( \mathcal{C}_1 \) is defined in (1.3). Consequently, we get
\[
(2.119) \quad \begin{cases}
\int_{\Gamma_0} (\partial_{\nu} \Delta u + (1 - \mu) \partial_{\nu} c_2 u) (h \cdot \nabla \pi) d\Gamma = 0, \\
\int_{\Gamma_0} (\Delta u + (1 - \mu) \mathcal{C}_1 u) \partial_{\nu} (h \cdot \nabla \pi) d\Gamma = \int_{\Gamma_0} (h \cdot \nu) |\Delta u|^2 d\Gamma, \\
\frac{1}{2} \int_{\Gamma_0} (h \cdot \nu) c(u, u) d\Gamma = \frac{1}{2} \int_{\Gamma_0} (h \cdot \nu) |\Delta u|^2 d\Gamma.
\end{cases}
\]
Now, by using Young’s inequality, we get
\[
(2.120) \quad -\Re \left\{ \int_{\Gamma_1} B_2 u (h \cdot \nabla \pi) d\Gamma \right\} \leq \frac{\varepsilon_1 R^2}{2} \int_{\Gamma_1} |B_2|^2 d\Gamma + \frac{1}{2 \varepsilon_1} \int_{\Gamma_1} |\nabla u|^2 d\Gamma,
\]
where \( R = \|h\|_{L^\infty(\Omega)} \) and \( \varepsilon_1 \) is an arbitrary positive constant fixed below. Now, according to the identity (3.9) in [25] (see also (3.7) in [24]), we notice that
\[
(2.121) \quad |\partial_{\nu}(h \cdot \nabla u)| \leq |\partial_{\nu} u| + R \sqrt{d(u, u)} \quad \text{on } \Gamma_1.
\]
Using (2.121), Cauchy-Schwarz and Young’s inequalities, (2.108), and (2.112), we get
\[
(2.122) \quad \Re \left\{ \int_{\Gamma_1} B_1 u \partial_{\nu}(h \cdot \nabla \pi) d\Gamma \right\} \leq \int_{\Gamma_1} |B_1 u| \left| \left( \partial_{\nu} u \right) + R \sqrt{d(u, u)} \right| d\Gamma \leq \left( \int_{\Gamma_1} |B_1|^2 d\Gamma \right)^{\frac{1}{2}} \left( \int_{\Gamma_1} |\partial_{\nu} u|^2 d\Gamma \right)^{\frac{1}{2}} + \frac{R^2 \varepsilon_2}{2} \int_{\Gamma_1} |B_1|^2 d\Gamma + \frac{1}{2 \varepsilon_2} \int_{\Gamma_1} d(u, u) d\Gamma,
\]
for all \( \varepsilon_2 > 0 \). Now, from (2.117) and (A.3), we get
\[
(2.123) \quad \frac{1}{2} \int_{\Gamma_1} (h \cdot \nu) c(u, u) d\Gamma \geq \frac{1 - \mu}{2 \delta} \int_{\Gamma_1} d(u, u) d\Gamma.
\]
Inserting (2.119), (2.120), (2.122) and (2.123) in (2.116), we obtain
\[
-\Re \left\{ \int_{\Omega} \Delta^2 u (h \cdot \nabla \pi) dx \right\} \leq -a(u, u) + \frac{1}{2} \int_{\Gamma_0} (h \cdot \nu) |\Delta u|^2 d\Gamma + \frac{\varepsilon_1 R^2}{2} \int_{\Gamma_1} |B_2 u|^2 d\Gamma + \frac{1}{2 \varepsilon_1} \int_{\Gamma_1} |\nabla u|^2 d\Gamma + \left( \frac{1}{2 \varepsilon_2} - \frac{1 - \mu}{2 \delta} \right) \int_{\Gamma_1} d(u, u) d\Gamma + \left( \int_{\Gamma_1} |B_1|^2 d\Gamma \right)^{\frac{1}{2}} \left( \int_{\Gamma_1} |\partial_{\nu} u|^2 d\Gamma \right)^{\frac{1}{2}} \leq \frac{R^2 \varepsilon_2}{2} \int_{\Gamma_1} |B_1|^2 d\Gamma,
\]
using (A.3) and taking \( \varepsilon_2 \geq \delta (1 - \mu)^{-1} \), we obtain
\[
-\Re \left\{ \int_{\Omega} \Delta^2 u (h \cdot \nabla u) dx \right\} \leq -a(u, u) + \frac{\varepsilon_1 R^2}{2} \int_{\Gamma_1} |B_2|^2 d\Gamma + \frac{1}{2 \varepsilon_1} \int_{\Gamma_1} |\nabla u|^2 d\Gamma \leq \frac{R^2 \varepsilon_2}{2} \int_{\Gamma_1} |B_1|^2 d\Gamma.
\]
Now, by using a trace theorem, there exists a positive constant \( C_{tr} \) such that
\[
\int_{\Gamma_1} |\nabla u|^2 d\Gamma \leq C_{tr} \|u\|_{H^2(\Omega)}^2,
\]
From the equivalence between the norm $\sqrt{a(u, u)}$ and the usual norm of $H^2(\Omega)$, there then exists a positive constant $C_{eq}$ such that

$$\int_{\Gamma_1} |\nabla u|^2 d\Gamma \leq C_{tr} ||u||^2_{H^2(\Omega)} \leq C_{tr} C_{eq} a(u, u).$$

Inserting the above inequality in (2.124) and taking $\varepsilon_1 = C_{tr} C_{eq}$, we obtain (2.115). Finally, the case when $B_1 u, B_2 u \in L^2(\Gamma_1)$ can be easily obtained by the standard density arguments as in Lemma 3.1 in [24]. The proof is thus complete.

□

**Lemma 2.9.** Under the hypotheses (H) and (A.3), the solution $U = (u, v, \xi, z^1, z^2)^T \in D(A)$ of (2.102)-(2.107) satisfies the following estimations

(2.125) $$\int_{\Omega} |\lambda u|^2 dx = o(1) \text{ and } a(u, u) = o(1).$$

**Proof.** First, inserting (2.102) in (2.103), we get

$$-\lambda^2 u + \Delta^2 u = \frac{i f_1}{\lambda} + \frac{f_2}{\lambda^2} \text{ in } \Omega.$$

Multiplying the above equation by $(h \cdot \nabla \nu)$, integrating over $\Omega$, then taking the real part, we obtain

(2.126) $$\Re \left\{ -\lambda^2 \int_{\Omega} u(h \cdot \nabla \nu) dx + \int_{\Omega} \Delta^2 u(h \cdot \nabla \nu) dx \right\} = \Re \left\{ \frac{i}{\lambda} \int_{\Omega} f_1(h \cdot \nabla \nu) dx + \frac{1}{\lambda^2} \int_{\Omega} f_2(h \cdot \nabla \nu) dx \right\}$$

Now, by using Green’s formula and the fact that $u = 0$ on $\Gamma_0$, then using (2.112), we get

(2.127) $$\Re \left\{ -\lambda^2 \int_{\Omega} u(h \cdot \nabla \nu) dx \right\} = \int_{\Omega} |\lambda u|^2 dx - \frac{1}{2} \int_{\Gamma_1} (h \cdot \nu)|\lambda u|^2 d\Gamma = \int_{\Omega} |\lambda u|^2 dx + o(1).$$

Using the fact that $a(u, u) = O(1)$ and $a(f_1, f_1) = o(1)$, we obtain

$$\left\{ \begin{array}{l} ||\nabla u||_{L^2(\Omega)} \leq ||u||_{H^2(\Omega)} \lesssim \sqrt{a(u, u)} = O(1), \\
||f_1||_{L^2(\Omega)} \leq ||f_1||_{H^2(\Omega)} \lesssim a(f_1, f_1) = o(1). \end{array} \right.$$

Thus, from the above estimations and the fact that $f_2 \rightarrow 0$ in $L^2(\Omega)$, we obtain

(2.128) $$\Re \left\{ \frac{i}{\lambda} \int_{\Omega} f_1(h \cdot \nabla \nu) dx + \frac{1}{\lambda^2} \int_{\Omega} f_2(h \cdot \nabla \nu) dx \right\} = o(|\lambda|^{-1}).$$

Inserting (2.127) in (2.126) and using (2.128), we obtain

(2.129) $$\int_{\Omega} |\lambda u|^2 dx = -\Re \left\{ \int_{\Omega} \Delta^2 u(h \cdot \nabla \nu) dx \right\} + o(1).$$

As (2.108), (2.112) and (2.115) yield

$$-\Re \left\{ \int_{\Omega} \Delta^2 u(h \cdot \nabla \nu) dx \right\} \leq -\frac{1}{2} a(u, u) + o(\lambda^{-2}),$$

inserting the above estimation in (2.129), we get

$$\int_{\Omega} |\lambda u|^2 dx + \frac{1}{2} a(u, u) = o(1).$$

The proof is thus complete. □

**Proof of Theorem 2.4** From Lemmas 2.5, 2.6 and 2.9, we deduce that

$$||U||_H = o(1),$$

which contradicts (2.100). □
3. Kirchhoff plate equation with delay terms on the boundary controls

3.1. Wellposedness and strong stability. In this section, we will establish the well-posedness and the strong stability of system (1.2). For this aim, as in [21], we introduce the following auxiliary variables

\[ z^1(x, \rho, t) := \partial_\rho u_t(x, t - \rho \tau_1), \quad x \in \Gamma_1, \rho \in (0, 1), \ t > 0, \]
\[ z^2(x, \rho, t) := u_t(x, t - \rho \tau_2), \quad x \in \Gamma_1, \rho \in (0, 1), \ t > 0. \]

Then, system (1.2) becomes

\[ u_t + \Delta^2 u = 0 \quad \text{in} \quad \Omega \times (0, \infty), \]
\[ u = \partial_\rho u = 0 \quad \text{on} \quad \Gamma_0 \times (0, \infty), \]
\[ B_1 u + \beta_1 \partial_\rho u + \beta_2 z^1(\cdot, 1, t) = 0 \quad \text{on} \quad \Gamma_1 \times (0, \infty), \]
\[ B_2 u - \gamma_1 u_t - \gamma_2 z^2(\cdot, 1, t) = 0 \quad \text{on} \quad \Gamma_1 \times (0, \infty), \]
\[ \tau_1 z^1_t(\cdot, \rho, t) + z^1_\rho(\cdot, \rho, t) = 0 \quad \text{on} \quad \Gamma_1 \times (0, 1) \times (0, \infty), \]
\[ \tau_2 z^2_t(\cdot, \rho, t) + z^2_\rho(\cdot, \rho, t) = 0 \quad \text{on} \quad \Gamma_1 \times (0, 1) \times (0, \infty), \]

with the following initial conditions

\[ \begin{cases} u(\cdot, 0) = u_0(\cdot), \quad u_t(\cdot, 0) = u_1(\cdot) \quad \text{in} \quad \Omega, \\ z^1(\cdot, \rho, 0) = f_0(\cdot, -\rho \tau_1) \quad \text{on} \quad \Gamma_1 \times (0, 1), \\ z^2(\cdot, \rho, 0) = g_0(\cdot, -\rho \tau_2) \quad \text{on} \quad \Gamma_1 \times (0, 1). \end{cases} \]

The energy of system (3.2)-(3.8) is given by

\[ E^0(t) = \frac{1}{2} \left\{ a(u, u) + \int_\Omega |u_t|^2 dx + \tau_1 |\beta_2| \int_{\Gamma_1} \int_0^1 |z^1(\cdot, \rho, t)|^2 \ d\rho d\Gamma + \tau_2 |\gamma_2| \int_{\Gamma_1} \int_0^1 |z^2(\cdot, \rho, t)|^2 \ d\rho d\Gamma \right\}, \]

where \( a \) is defined in (2.11). If \((u, u_t, z^1, z^2)\) is a regular solution of (3.2)-(3.8), then similarly to the proof of Lemma 2.1, we obtain

\[ \frac{d}{dt} E^0(t) \leq - \left( \beta_1 - |\beta_2| \right) \int_{\Gamma_1} |\partial_\rho u_t|^2 d\Gamma - (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |u_t|^2 d\Gamma. \]

Hence under the hypothesis \((H)\), system (3.2)-(3.8) is dissipative in the sense that its energy is non-increasing with respect to time. Let us define the Hilbert space \( H^0 \) by

\[ H^0 = H^2_0(\Omega) \times L^2(\Omega) \times L^2(\Gamma_1 \times (0, 1)), \]

equipped with the following inner product

\[ (U, U_1)_{H^0} = a(u, u_1) + \int_\Omega |u_t|^2 dx + \tau_1 |\beta_2| \int_{\Gamma_1} \int_0^1 |z^1(\cdot, \rho, t)|^2 \ d\rho d\Gamma + \tau_2 |\gamma_2| \int_{\Gamma_1} \int_0^1 |z^2(\cdot, \rho, t)|^2 \ d\rho d\Gamma, \]

where \( U = (u, v, z^1, z^2)^T, \ U_1 = (u_1, v_1, z^1_1, z^2_1)^T \in H^0 \). Now, we define the linear unbounded operator \( A^0 : D(A^0) \subset H^0 \rightarrow H^0 \) by:

\[ D(A^0) = \left\{ U = (u, v, z^1, z^2)^T \in D_{\Gamma_0}(\Delta^2) \times H^2_0(\Omega) \times (L^2(\Gamma_1; H^1(0, 1)))^2 \right\}, \]

\[ A^0 \begin{pmatrix} u \\ v \\ z^1 \\ z^2 \end{pmatrix} = \begin{pmatrix} -\Delta^2 u \\ -\frac{1}{\tau_1} z^1_\rho \\ -\frac{1}{\tau_2} z^2_\rho \end{pmatrix}, \quad \forall U = (u, v, z^1, z^2)^T \in D(A^0). \]

Now, if \( U = (u, u_t, z^1, z^2)^T \) is solution of (3.2)-(3.8) and is sufficiently regular, then system (3.2)-(3.8) can be written as the following first order evolution equation

\[ U_t = A^0 U, \quad U(0) = U_0. \]
where \( U_0 = (u_0, u_1, f_0(\cdot, -\rho \tau_1), g_0(\cdot, -\rho \tau_2))^\top \in \mathcal{H}^0 \).

**Proposition 3.1.** Under the hypothesis (H), the unbounded linear operator \( A^0 \) is m-dissipative in the energy space \( \mathcal{H}^0 \).

**Proof.** Similarly to the proof of Lemma 2.1, we show that
\[
\Re(A^0 U, U)_{\mathcal{H}^0} \leq -\left( \beta_1 - |\beta_2| \right) \int_{\Gamma_1} |\partial_{\nu} v|^2 d\Gamma - (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |v|^2 d\Gamma \leq 0, \quad \forall U \in D(A^0)
\]
and that \( 0 \in \rho(A^0) \). \( \Box \)

According to Lumer-Phillips theorem (see [22]), Proposition 3.1 implies that the operator \( A^0 \) generates a \( C_0 \)-semigroup of contractions \( e^{tA^0} \) in \( \mathcal{H}^0 \) which gives the well-posedness of (3.13). Then, we have the following result:

**Theorem 3.1.** For all \( U_0 \in \mathcal{H}^0 \), system (3.13) admits a unique weak solution \( U(t) = e^{tA^0} U_0 \in C^0(\mathbb{R}^+, \mathcal{H}^0) \). Moreover, if \( U_0 \in D(A^0) \), then the system (3.13) admits a unique strong solution \( U(t) = e^{tA^0} U_0 \in C^0(\mathbb{R}^+, D(A^0)) \cap C^1(\mathbb{R}^+, \mathcal{H}^0) \).

**Theorem 3.2.** Under the hypotheses (H) and (A.3), the \( C_0 \)-semigroup of contraction \( \left( e^{tA^0} \right)_{t \geq 0} \) is strongly stable in \( \mathcal{H}^0 \); i.e., for all \( U_0 \in \mathcal{H}^0 \), the solution of (3.13) satisfies
\[
\lim_{t \to +\infty} \| e^{tA^0} U_0 \|_{\mathcal{H}^0} = 0.
\]

**Proof.** Similarly to the proof of Theorem 2.2, we can show that
\[
\ker(i\lambda I - A^0) = \{ 0 \}, \quad \forall \lambda \in \mathbb{R},
\]
consequently \( A^0 \) has no pure imaginary eigenvalues and \( \sigma(A^0) \cap i\mathbb{R} = \emptyset \), and we conclude by Theorem A.2. \( \Box \)

**3.2. Exponential stability.**

**Theorem 3.1.** Under the hypotheses (H) and (A.3), the \( C_0 \)-semigroup \( e^{tA^0} \) is exponentially stable; i.e. there exists constants \( M \geq 1 \) and \( \epsilon > 0 \) independent of \( U_0 \in \mathcal{H}^0 \) such that
\[
\| e^{tA^0} U_0 \|_{\mathcal{H}^0} \leq M e^{-\epsilon t} \| U_0 \|_{\mathcal{H}^0}, \forall t \geq 0.
\]

**Proof.** Since \( i\mathbb{R} \subset \rho(A^0) \) (see Section 3.1), according to Theorem A.3, to prove Theorem 3.1, it remains to prove that
\[
\limsup_{\lambda \in \mathbb{R}, |\lambda| \to \infty} \| (i\lambda I - A^0)^{-1} \|_{\mathcal{L}(\mathcal{H}^0)} < \infty.
\]
We will prove condition (3.16) by a contradiction argument. For this purpose, suppose that (3.16) is false, then there exists \( \left\{ (\lambda_n, U_n := (u_n, v_n, z_n^1, z_n^2)^\top) \right\}_{n \geq 1} \subset \mathbb{R}^* \times D(A^0) \) with
\[
|\lambda_n| \to \infty \quad \text{as} \quad n \to \infty \quad \text{and} \quad \| U_n \|_{\mathcal{H}^0} = 1, \forall n \geq 1,
\]
such that
\[
(i\lambda_n I - A^0)U_n = F_n := (f_1, f_2, g_1, g_2)^\top \to 0 \quad \text{in} \quad \mathcal{H}^0, \quad \text{as} \quad n \to \infty.
\]
For simplicity, we drop the index \( n \). Equivalently, from (3.18), we have
\[
\begin{align*}
i\lambda_n u - v &= f_1 \to 0 \quad \text{in} \quad H^2_{\Omega}(\Omega), \\
i\lambda_n v + \Delta^2 u &= f_2 \to 0 \quad \text{in} \quad L^2(\Omega), \\
i\lambda_n z^1 + \frac{1}{\tau_1} z^1 &= g_1 \to 0 \quad \text{in} \quad L^2(\Gamma_1 \times (0, 1)), \\
i\lambda_n z^2 + \frac{1}{\tau_2} z^2 &= g_2 \to 0 \quad \text{in} \quad L^2(\Gamma_1 \times (0, 1)).
\end{align*}
\]
Taking the inner product of (3.18) with $U$ in $\mathcal{H}^0$ and using (3.14), we get
\[
(\beta_1 - |\beta_2|) \int_{\Gamma_1} |\partial_\nu v|^2 \, d\Gamma + (\gamma_1 - |\gamma_2|) \int_{\Gamma_1} |v|^2 \, d\Gamma \leq -\Re(\mathcal{A}^0 U, U)_{\mathcal{H}^0} = \Re(F, U)_{\mathcal{H}^0} \leq \|F\|_{\mathcal{H}^0} \|U\|_{\mathcal{H}^0},
\]
From the above estimation, (H) and the fact that $\|F\|_{\mathcal{H}^0} = o(1)$ and $\|U\|_{\mathcal{H}^0} = 1$, we obtain
\[
(3.23) \quad \int_{\Gamma_1} |\partial_\nu v|^2 \, d\Gamma = o(1) \quad \text{and} \quad \int_{\Gamma_1} |v|^2 \, d\Gamma = o(1),
\]
consequently, from (3.19), a trace theorem and the fact that $\|F\|_{\mathcal{H}^0} = o(1)$, we get
\[
(3.24) \quad \int_{\Gamma_1} |\partial_\nu v|^2 \, d\Gamma = o(\lambda^{-2}) \quad \text{and} \quad \int_{\Gamma_1} |v|^2 \, d\Gamma = o(\lambda^{-2}).
\]
Now, from (3.21), (3.22) and the fact that $z^1(\cdot,0) = \partial_\nu v(\cdot)$, $z^2(\cdot,0) = v(\cdot)$ on $\Gamma_1$, we may write
\[
z^1(\cdot, \rho) = \partial_\nu v e^{-i\lambda_1 \rho} + \tau_1 \int_0^\rho g_1(\cdot, s)e^{i\lambda_1(s-\rho)} \, ds \quad \text{on} \quad \Gamma_1 \times (0,1),
\]
\[
z^2(\cdot, \rho) = v e^{-i\lambda_2 \rho} + \tau_2 \int_0^\rho g_2(\cdot, s)e^{i\lambda_2(s-\rho)} \, ds \quad \text{on} \quad \Gamma_1 \times (0,1).
\]
From the above equations, (3.23) and the fact that $\|F\|_{\mathcal{H}^0} = o(1)$, we obtain
\[
(3.25) \quad \int_{\Gamma_1} \int_0^1 |z^1|^2 \, d\rho \, d\Gamma = o(1) \quad \text{and} \quad \int_{\Gamma_1} \int_0^1 |z^2|^2 \, d\rho \, d\Gamma = o(1),
\]
and
\[
(3.26) \quad \int_{\Gamma_1} |z^1(\cdot,1)|^2 \, d\Gamma = o(1) \quad \text{and} \quad \int_{\Gamma_1} |z^2(\cdot,1)|^2 \, d\Gamma = o(1).
\]
Next, from the above estimations, (3.23) and the fact that $U \in D(\mathcal{A}^0)$, we get
\[
(3.27) \quad \int_{\Gamma_1} |B_1 u|^2 \, d\Gamma = o(1) \quad \text{and} \quad \int_{\Gamma_1} |B_2 u|^2 \, d\Gamma = o(1).
\]
Moreover, from (3.24), (3.27) and Lemma 2.8, we obtain
\[
(3.28) \quad -\Re \left\{ \int_{\Omega} \Delta^2 u(h \cdot \nabla \pi) \, dx \right\} \leq -\frac{1}{2} a(u, u) + o(1).
\]
On the other hand, inserting (3.19) in (3.20), then multiplying the resulting equation by $(h \cdot \nabla \pi)$ and continue with the same argument as in the proof of Lemma 2.9, we obtain
\[
(3.29) \quad \int_{\Omega} |\lambda u|^2 \, dx = -\Re \left\{ \int_{\Omega} \Delta^2 u(h \cdot \nabla \pi) \, dx \right\} + o(1),
\]
and consequently, from (3.28), we deduce that
\[
(3.30) \quad \int_{\Omega} |\lambda u|^2 \, dx = o(1) \quad \text{and} \quad a(u, u) = o(1).
\]
Finally, from (3.25) and (3.30), we obtain
\[
\|U\|_{\mathcal{H}^0} = o(1),
\]
which contradicts (3.17). The proof is thus complete. \(\square\)

3.3. Some instability results. In this subsection, we will give some instability examples of system (1.2) in the cases $|\beta_2| \geq \beta_1$ and $|\gamma_2| \geq \gamma_1$. This is achieved by distinguishing between the following cases:

(IS$_1$) \quad $|\beta_2| = \beta_1$ and $|\gamma_2| = \gamma_1$,

(IS$_2$) \quad $|\beta_2| \geq \beta_1$ and $|\gamma_2| \geq \gamma_1$ and $|\beta_2| - \beta_1 + |\gamma_2| - \gamma_1 > 0$.

**Theorem 3.3.** If (IS$_1$) or (IS$_2$) hold, then there exist sequences of delays and solutions of (1.2) corresponding to these delays such that their standard energy is constant.
Proof. We seek for a solution of system (1.2) in the form
\[ u(x, t) = e^{i \lambda t} \varphi(x), \quad \text{with } \lambda \neq 0. \]
Inserting (3.31) in (1.2), we get
\[ \begin{cases} 
- \lambda^2 \varphi + \Delta^2 \varphi = 0 \quad \text{in } \Omega, \\
\varphi = \partial_t \varphi = 0 \quad \text{on } \Gamma_0, \\
B_1 \varphi = -i \lambda (\beta_1 + \beta_2 e^{-i \lambda \tau_1}) \partial_t \varphi \quad \text{on } \Gamma_1, \\
B_2 \varphi = i \lambda (\gamma_1 + \gamma_2 e^{-i \lambda \tau_2}) \varphi \quad \text{on } \Gamma_1.
\end{cases} \tag{3.32} \]
Let \( \theta \in H^2_{\Gamma_0}(\Omega) \). Multiplying the first equation in (3.32) by \( \overline{\theta} \), then using Green’s formula, we get
\[ \lambda^2 \int_\Omega \varphi \overline{\theta} dx + a(\varphi, \theta) + i \lambda (\beta_1 + \beta_2 e^{-i \lambda \tau_1}) \int_{\Gamma_1} \partial_t \varphi \partial_t \overline{\theta} d\Gamma + i \lambda (\gamma_1 + \gamma_2 e^{-i \lambda \tau_2}) \int_{\Gamma_1} \varphi \overline{\theta} d\Gamma = 0, \tag{3.33} \]
for all \( \theta \in H^2_{\Gamma_0}(\Omega) \). Now, since \(|\beta_2| \geq |\beta_1| \) and \(|\gamma_2| \geq |\gamma_1| \), then we assume that
\[ \cos(\lambda \tau_1) = -\frac{\beta_1}{\beta_2} \quad \text{and} \quad \cos(\lambda \tau_2) = -\frac{\gamma_1}{\gamma_2}. \tag{3.34} \]
Thus, we choose
\[ \beta_2 \sin(\lambda \tau_1) = \sqrt{\beta_2^2 - \beta_1^2} \quad \text{and} \quad \gamma_2 \sin(\lambda \tau_2) = \sqrt{\gamma_2^2 - \gamma_1^2}. \tag{3.35} \]
Inserting (3.34) and (3.35) in (3.33), we obtain
\[ - \lambda^2 \int_\Omega \varphi \overline{\theta} dx + a(\varphi, \theta) + \lambda \sqrt{\beta_2^2 - \beta_1^2} \int_{\Gamma_1} \partial_t \varphi \partial_t \overline{\theta} d\Gamma + \lambda \sqrt{\gamma_2^2 - \gamma_1^2} \int_{\Gamma_1} \varphi \overline{\theta} d\Gamma = 0, \tag{3.36} \]
for all \( \theta \in H^2_{\Gamma_0}(\Omega) \). Now, taking \( \theta = \varphi \) in (3.36), we obtain
\[ - \lambda^2 \int_\Omega |\varphi|^2 dx + a(\varphi, \varphi) + \lambda \sqrt{\beta_2^2 - \beta_1^2} \int_{\Gamma_1} |\partial_t \varphi|^2 d\Gamma + \lambda \sqrt{\gamma_2^2 - \gamma_1^2} \int_{\Gamma_1} |\varphi|^2 d\Gamma = 0. \tag{3.37} \]
Without loss of generality, we can assume that
\[ \|\varphi\|_{L^2(\Omega)} = 1. \tag{3.38} \]
Thus, from (3.37) and (3.38), we get
\[ \lambda^2 - a(\varphi, \varphi) - \lambda \sqrt{\beta_2^2 - \beta_1^2} q_0(\varphi) - \lambda \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) = 0, \tag{3.39} \]
where
\[ q(\varphi) = \int_{\Gamma_1} |\varphi|^2 d\Gamma \quad \text{and} \quad q_0(\varphi) = \int_{\Gamma_1} |\partial_t \varphi|^2 d\Gamma. \tag{3.40} \]
We define
\[ W := \left\{ w \in H^2_{\Gamma_0}(\Omega) \mid \|w\|_{L^2(\Omega)} = 1 \right\}. \]
Now, we distinguish two cases.

Case 1: If \((IS_1)\) holds, then from (3.39), we have
\[ a(\varphi, \varphi) = \lambda^2. \tag{3.41} \]
Let us define
\[ \lambda^2 := \min_{w \in W} a(w, w). \tag{3.42} \]
Now, if \( \varphi \) verifies
\[ a(\varphi, \varphi) = \min_{w \in W} a(w, w), \]
then it easy to see that \( \varphi \) is a solution of (3.33) and consequently (3.31) is a solution of (1.2). Moreover, from (3.31) and (3.9), we get
\[ E^0(t) = E^0(0) \geq a(\varphi, \varphi) + \lambda^2 \int_\Omega |\varphi|^2 dx = 2 \lambda^2 > 0, \quad \forall t \geq 0. \]
Thus, the energy of (1.2) is constant and positive. Further from our assumptions
\[
\cos(\lambda \tau_1) = -1, \quad \sin(\lambda \tau_1) = 0, \quad \cos(\lambda \tau_2) = -1, \quad \sin(\lambda \tau_2) = 0,
\]
system (3.32) becomes
\[
\begin{aligned}
-\lambda^2 \varphi + \Delta^2 \varphi &= 0 \quad \text{in } \Omega, \\
\varphi &= \partial_\nu \varphi = 0 \quad \text{on } \Gamma_0, \\
B_1 \varphi &= 0 \quad \text{on } \Gamma_1, \\
B_2 \varphi &= 0 \quad \text{on } \Gamma_1.
\end{aligned}
\]
(3.43)
So, we can take a sequence \((\lambda_n)\) of positive real numbers defined by
\[
\lambda_n^2 = \Lambda_n^2, \quad n \in \mathbb{N},
\]
where \(\Lambda_n^2, \quad n \in \mathbb{N},\) are the eigenvalues for the bi-Laplacian operator with the boundary conditions (3.43)\(_2\)-(3.43)\(_4\). Then, setting
\[
\lambda_n \tau_1 = (2k + 1)\pi, \quad k \in \mathbb{N} \quad \text{and} \quad \lambda_n \tau_2 = (2l + 1)\pi, \quad l \in \mathbb{N},
\]
we get the following sequences of delays
\[
\tau_{1,n,k} = \frac{(2k + 1)\pi}{\lambda_n}, \quad k \in \mathbb{N} \quad \text{and} \quad \tau_{2,n,l} = \frac{(2l + 1)\pi}{\lambda_n}, \quad l \in \mathbb{N},
\]
which becomes arbitrarily small (or large) for suitable choices of the indices \(n, k, l \in \mathbb{N}\). Therefore, we have found sets of time delays for which system (1.2) is not asymptotically stable.

**Case 2:** If (IS\(_2\)) holds, then from (3.39), we have
\[
\lambda = \frac{1}{2} \left[ \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) + \sqrt{\left( \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) \right)^2 + 4a(\varphi, \varphi)} \right].
\]
(3.44)
Let us define
\[
\lambda := \frac{1}{2} \min_{w \in W} \left\{ \sqrt{\beta_2^2 - \beta_1^2} q_\nu(w) + \sqrt{\gamma_2^2 - \gamma_1^2} q(w) + \sqrt{\left( \sqrt{\beta_2^2 - \beta_1^2} q_\nu(w) + \sqrt{\gamma_2^2 - \gamma_1^2} q(w) \right)^2 + 4a(w, w)} \right\}.
\]
(3.45)
Let us prove that if the minimum in the right-hand side of (3.45) is attained at \(\varphi\), that is
\[
\sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) + \sqrt{\left( \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) \right)^2 + 4a(\varphi, \varphi)}
\]
:= \min_{w \in W} \left\{ \sqrt{\beta_2^2 - \beta_1^2} q_\nu(w) + \sqrt{\gamma_2^2 - \gamma_1^2} q(w) + \sqrt{\left( \sqrt{\beta_2^2 - \beta_1^2} q_\nu(w) + \sqrt{\gamma_2^2 - \gamma_1^2} q(w) \right)^2 + 4a(w, w)} \right\},
\]
(3.46)
then \(\varphi\) is a solution of (3.36). For this aim, take for \(\varepsilon \in \mathbb{R}\)
\[
w = \varphi + \varepsilon \theta \quad \text{with} \quad \theta \in H_{\Gamma_0}^2(\Omega) \quad \text{such that} \quad \int_\Omega \varphi \theta dx = 0.
\]
(3.47)
Thus, we have
\[
\|w\|_{L^2(\Omega)}^2 = \|\varphi\|_{L^2(\Omega)}^2 + \varepsilon^2 \|\theta\|_{L^2(\Omega)}^2 = 1 + \varepsilon^2 \|\theta\|_{L^2(\Omega)}^2.
\]
(3.48)
Now, if we define
\[
    f(\varepsilon) := \frac{1}{1 + \varepsilon^2} \left( \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi + \varepsilon \theta) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi + \varepsilon \theta) \right) + \frac{\sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi + \varepsilon \theta) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi + \varepsilon \theta)}{\gamma_2^2 - \gamma_1^2} + 4a(\varphi + \varepsilon \theta, \varphi + \varepsilon \theta),
\]
(3.49)

thus, from (3.46), we get
\[
    f(\varepsilon) \geq f(0) = \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) + \sqrt{\beta_2^2 - \beta_1^2} q_\nu(\varphi) + \sqrt{\gamma_2^2 - \gamma_1^2} q(\varphi) + 4a(\varphi, \varphi),
\]
which gives
\[
    f'(0) = 0.
\]
Consequently, after an easy computation, we obtain
\[
    a(\varphi, \theta) + \lambda \sqrt{\beta_2^2 - \beta_1^2} \int_{\Gamma_1} \partial_\nu \varphi \partial_\nu \overline{\varphi} d\Gamma + \lambda \sqrt{\gamma_2^2 - \gamma_1^2} \int_{\Gamma_1} \varphi \overline{\varphi} d\Gamma = 0.
\]
Since any function \( \tilde{\varphi} \in H_{||0}(\Omega) \) can be decomposed as
\[
    \tilde{\varphi} = \alpha \varphi + \theta \quad \text{with} \quad \alpha \in \mathbb{R} \quad \text{and} \quad \theta \in H_{||0}(\Omega) \quad \text{such that} \quad \int_{\Omega} \varphi \overline{\theta} dx = 0,
\]
from (3.50) and (3.37), we obtain that \( \varphi \) satisfies (3.36). Thus, for such \( \lambda > 0 \)
\[
    \lambda \tau_1 = \arccos \left( \frac{-\beta_1}{\beta_2} \right) + 2k\pi, \quad k \in \mathbb{N} \quad \text{and} \quad \lambda \tau_2 = \arccos \left( \frac{-\gamma_1}{\gamma_2} \right) + 2l\pi, \quad l \in \mathbb{N},
\]
define a sequences of time delays for which (1.2) is not asymptotically stable. The proof is thus complete. \( \square \)

**Appendix A. Some notions and stability theorems**

In order to make this paper more self-contained, we recall in this short appendix some notions and stability results used in this work.

**Definition A.1.** Assume that \( A \) is the generator of \( C_0 \)-semigroup of contractions \( (e^{tA})_{t \geq 0} \) on a Hilbert space \( H \). The \( C_0 \)-semigroup \( (e^{tA})_{t \geq 0} \) is said to be
\begin{enumerate}
    \item Strongly stable if
    \[
        \lim_{t \to +\infty} \| e^{tA}x_0 \|_H = 0, \quad \forall \ x_0 \in H.
    \]
    \item Exponentially (or uniformly) stable if there exists two positive constants \( M \) and \( \varepsilon \) such that
    \[
        \| e^{tA}x_0 \|_H \leq Me^{-\varepsilon t} \| x_0 \|_H, \quad \forall t > 0, \ \forall x_0 \in H.
    \]
    \item Polynomially stable if there exists two positive constants \( C \) and \( \alpha \) such that
    \[
        \| e^{tA}x_0 \|_H \leq Ct^{-\alpha} \| A x_0 \|_H, \quad \forall t > 0, \ \forall x_0 \in D(A).
    \]
\end{enumerate}

To show the strong stability of a \( C_0 \)-semigroup we rely on the following result due to Arendt-Batty [3].

**Theorem A.2.** Assume that \( A \) is the generator of a \( C_0 \)-semigroup of contractions \( (e^{tA})_{t \geq 0} \) on a Hilbert space \( H \). If \( A \) has no pure imaginary eigenvalues and \( \sigma (A) \cap i\mathbb{R} \) is countable, where \( \sigma (A) \) denotes the spectrum of \( A \), then the \( C_0 \)-semigroup \( (e^{tA})_{t \geq 0} \) is strongly stable. \( \square \)

Concerning the characterisation of exponential stability of a \( C_0 \)-semigroup of contractions we rely on the following result due to Huang [13] and Prüss [23].

**Theorem A.3.** Let \( A : D(A) \subset H \to H \) generates a \( C_0 \)-semigroup of contractions \( (e^{tA})_{t \geq 0} \) on \( H \). Then, the \( C_0 \)-semigroup \( (e^{tA})_{t \geq 0} \) is exponentially stable if and only if \( i\mathbb{R} \subset \rho(A) \) and
\[
    \limsup_{\lambda \in \mathbb{R}, \ |\lambda| \to \infty} \| (i\lambda I - A)^{-1} \|_{L(H)} < \infty.
\]
Finally for the polynomial stability of a $C_0-$semigroup of contractions we use the following result due to Borichev and Tomilov [6] (see also [4], [18], and the recent paper [26]).

**Theorem A.4.** Assume that $A$ is the generator of a strongly continuous semigroup of contractions $(e^{tA})_{t \geq 0}$ on $\mathcal{H}$. If $i\mathbb{R} \subset \rho(A)$, then for a fixed $\ell > 0$ the following conditions are equivalent

\[(A.1) \quad \limsup_{\lambda \in \mathbb{R}, |\lambda| \to \infty} \frac{1}{|\lambda|^{\ell}} \|(i\lambda I - A)^{-1}\|_{\mathcal{L}(\mathcal{H})} < \infty,\]

\[(A.2) \quad \|e^{tA}U_0\|_{\mathcal{H}}^2 \leq \frac{C}{t^{2\ell}} \|U_0\|_{D(A)}^2, \quad \forall t > 0, U_0 \in D(A), \text{ for some } C > 0.\]

Let us end up this appendix with the definition of our multiplier geometric control condition.

**Definition A.5.** We say that the partition $(\Gamma_0, \Gamma_1)$ of the boundary $\Gamma$ satisfies the multiplier geometric control condition \textbf{MGC} (see Fig. 1 for an illustration) if there exists a point $x_0 \in \mathbb{R}^2$ and a positive constant $\delta$ such that

\[(A.3) \quad h \cdot \nu \geq \delta^{-1} \quad \text{on } \Gamma_1 \quad \text{and} \quad h \cdot \nu \leq 0 \quad \text{on } \Gamma_0,\]

where $h(x) = x - x_0$.

**Figure 1.** An example where the \textbf{MGC} boundary condition holds.

\[\square\]
