Keywords: Generalized Integrals; Lagrange Equation; Evaluations; Solvability.

Abstract

Based on previous work we construct an equation (Lagrange equation) and relate it with a system of generalized integrals and differential equations in such a way to provide useful evaluations and connections between them.

1 The inversion problem in the complex analog

The Lagrange inversion formula states that if \( f(A) \) is analytic in \( \mathbb{C} \), with no zero in the origin, then in some neighborhood around 0 we have that equation

\[
\frac{w}{f(w)} = q
\]

have solution

\[
w = w(q) = \sum_{n=1}^{\infty} c_n q^n.
\]

The coefficients \( c_n \) are given from

\[
c_n = \frac{1}{\Gamma(n)} \left[ \left( \frac{D}{Dh} \right)^{n-1} (f(h)^n) \right]_{h=0}, \quad n = 1, 2, \ldots.
\]

Moreover we can extend the above theorem (formula) to

\[
g_0(w(q)) = g_0(0) + \sum_{n=1}^{\infty} q^n \frac{1}{\Gamma(n)} \left[ \left( \frac{D}{Dh} \right)^{n-1} (g_0(h)(f(h)^n))^{n-1} \right]_{h=0}
\]

where \( g_0(A) \) is also analytic. Setting \( g_0(A) = e^A \), we get

\[
e^{w(q)} = 1 + \sum_{n=1}^{\infty} q^n \frac{1}{\Gamma(n)} \left[ \left( \frac{D}{Dh} \right)^{n-1} (e^h(f(h)^n))^{n-1} \right]_{h=0}
\]
Also in view of [3] Theorem 20, it holds the following formula

\[ e^{w(q)} = \prod_{n=1}^{\infty} \left( 1 - q^n \right)^{-\frac{1}{2}} \sum_{d|n} \frac{a_{d/n}}{\left( \frac{\theta_{\frac{1}{n}}}{\theta_{\frac{1}{n}}} \right)^{d-1}} \left( f(h)^{d} \right) k=0. \tag{6} \]

Set now

\[ a_n = n c_n. \tag{7} \]

Then in view of [2], in the function

\[ \frac{1}{P(z)} = \sum_{n=1}^{\infty} a_n q^n, \quad q = e^{2\pi i z}, \quad Im(z) > 0, \tag{8} \]

is attached a differential equation

\[ X'(A) + 2^{4/3} A^{2/3} (1 - A^2)^{-1/3} P(X(A)) = 0. \tag{9} \]

If \( m^*(z) \) is the elliptic singular modulus defined as (see [4]):

\[ m^*(z) := \left( \frac{\theta_2 (e^{2\pi i z})}{\theta_3 (e^{2\pi i z})} \right)^2, \quad Im(z) > 0, \tag{10} \]

where

\[ \theta_2(q) = \sum_{n=-\infty}^{\infty} q^{(n+1/2)^2}, \quad \theta_3(q) = \sum_{n=-\infty}^{\infty} q^n, \tag{11} \]

then also in view of [3] we have that the function

\[ Y(z) = X(m^*(2z)) \tag{12} \]

satisfies

\[ Y'(z) = 4\pi i \cdot \eta(z)^4 P(Y(z)). \tag{13} \]

Moreover if

\[ F(z) := \int_{Y(i\infty)}^{z} \frac{dt}{P(t)}, \tag{14} \]

then

\[ F(Y(z)) = -\sqrt{2} B_0 \left( m^*(2z)^2, \frac{1}{6}, \frac{2}{3} \right), \tag{15} \]

(here \( B_0(z; a, b) := \int_0^{z} t^{a-1} (1-t)^{b-1} dt \) is the incomplete Beta function) and

\[ F \left( Y \left( \frac{-1}{z} \right) \right) + F(Y(z)) = -\frac{\sqrt{2}}{\pi} \frac{\Gamma \left( \frac{1}{2} \right)^3}{\pi \sqrt{2}}. \tag{16} \]

Also

\[ \exp \left( 2\pi i \int_{Y(i\infty)}^{z} \frac{dt}{P(t)} \right) = \prod_{n=1}^{\infty} (1 - q^n)^{-\frac{1}{2}} \sum_{d|n} a_{d/n} q^{(n/d)} = \]
\[
\exp \left( 8\pi^2 \int_{i \infty}^{\infty} \eta(t)^4 dt \right). \tag{17}
\]

Note that
\[
2\pi i \int_{z_1}^{z_2} \eta(t)^4 dt = \left[ \frac{1}{\sqrt{A}} B_0 \left( m^* (2t)^2; \frac{1}{6}; \frac{2}{3} \right) \right]_{t=z_1}^{t=z_2}, \quad \text{Im}(z_1), \text{Im}(z_2) > 0 \tag{18}
\]
and \( \eta(z) \) is the Dedekind’s eta function
\[
\eta(z) = q^{1/24} \prod_{n=1}^{\infty} (1 - q^n), \quad q = e(z), \text{Im}(z) > 0. \tag{19}
\]

Now according to connection (7) we have
\[
2\pi i \int_{i \infty}^{z} \frac{dt}{P(t)} = w(q). \tag{20}
\]

Hence
\[
P(z) = \frac{1}{qw'(q)}. \tag{21}
\]

From (15) then we get
\[
w \left( e^{2\pi i Y(z)} \right) = -2\pi i \sqrt[3]{2} B_0 \left( m^* (2z)^2; \frac{1}{6}; \frac{2}{3} \right) + c. \tag{22}
\]

Hence
\[
w \left( e^{2\pi i X(A)} \right) = -2\pi i \sqrt[3]{2} B_0 \left( A^2; \frac{1}{6}; \frac{2}{3} \right) + c. \tag{23}
\]

But it is known that (see [3] Theorem 12)
\[
X(A) = h \left( \sqrt[3]{2} B_0 \left( A^2; \frac{1}{6}; \frac{2}{3} \right) \right) \tag{24}
\]

Hence easily
\[
e^{2\pi i h(A)} = w^{-1} (-2\pi i A + c) \tag{25}
\]
and
\[
e^{2\pi i h(A)} = \frac{-2\pi i A + c}{f(-2\pi i A + c)}. \tag{26}
\]

But relation (24) gives (we use the notation \( q_A = e(A) \)):
\[
w \left( e^{2\pi i A} \right) = -2\pi ih_i(A) + c \Rightarrow
\]
\[
h_i(A) = -\frac{w(q_A)}{2\pi i} + \frac{c}{2\pi i} \tag{27}
\]
and
\[
h'_i(A) = -w'(q_A)q_A. \tag{28}
\]

3
From the analysis given in [3] we have (Corollary 1, eq 33) we have

\[
5 \int_{0}^{\psi(A)} \frac{dt}{t \sqrt{t^5 - 11 - t^5}} = - \frac{w(e^{2\pi i A})}{2\pi i} + \frac{c}{2\pi i}.
\] (29)

However if we introduce the function \( F_1(A) \) (as in [1]) such that

\[
F_1'(A) = 5^{-1} F_1(A) \frac{\sqrt{F_1(A)^5 - 11 - F_1(A)^5}}{11 - 5 \sqrt{5}}
\] (30)

then

\[
F_1^{-1}(A) = 6A^{5/6} F_{Ap} \left[ \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \frac{1}{6} \right],
\] (31)

where

\[
F_{Ap}(a, b_1, b_2; c; x, y) = \sum_{m, n=0}^{\infty} \frac{(a)_{m+n} (b_1)_m (b_2)_n x^m y^n}{(c)_{m+n} m! n!}, |x| < 1, |y| < 1,
\] (32)

is the first Appell function (not to confused with \( F_1 \) defined in this article) and

\[
5 \int_{0}^{F_1(A)} \frac{dt}{t \sqrt{t^5 - 11 - t^5}} = A.
\] (33)

For this reason we can write

**Theorem 1.**

The functions \( y(A) \) and \( w(qA) \) are related with the following identity:

\[
F_1 \left( - \frac{w(qA)}{2\pi i} + \frac{c}{2\pi i} \right) = y(A).
\] (34)

Moreover we have

\[
\frac{1}{G(y(A))} = h'(A) = - w'(qA) qA.
\] (35)

Hence

\[
-w'(qA) qA G \left( F_1 \left( - \frac{w(qA)}{2\pi i} + \frac{c}{2\pi i} \right) \right) = 1 \Leftrightarrow
\]

\[
G(y(A)) = - P(A).
\] (37)

Continuing our arguments we have

\[
G \left( F_1 \left( - \int_{i\infty}^{P(A)} \frac{dt}{P(t)} + \frac{c}{2\pi i} \right) \right) = - A.
\] (38)

This is true because

\[
- \frac{w(qA)}{2\pi i} = - \int_{i\infty}^{A} \frac{dt}{P(t)}.
\]
Hence (38) gives

\[- \int_{\infty}^{P_i(A)} \frac{dt}{P(t)} + \frac{c}{2\pi i} = F_1'^{(1)} \left( G'^{(1)}(-A) \right) \Rightarrow \]

\[- \frac{P_i'(A)}{A} = \frac{d}{dA} \left( F_1'^{(1)} \left( G'^{(1)}(-A) \right) \right) \Rightarrow \]

\[P^{(-1)'}(A) = -A \frac{d}{dA} \left( F_1'^{(1)} \left( G'^{(1)}(-A) \right) \right). \quad (39)\]

Also

\[P^{(-1)''}(e(A)) \ 2\pi i = -e(A)2\pi i F_1'^{(1)} \left( G'^{(1)}(-e(A)) \right) G'^{(1)}(-e(A)) \Leftrightarrow \]

\[2\pi i \int P^{(-1)'}(e(A)) dA = F_1'^{(1)} \left( G'^{(1)}(-e(A)) \right). \]

Hence assuming that \(P^{(-1)'}(A) = H'(A)A\) we get

\[2\pi i H(A) = F_1'^{(1)} \left( G'^{(1)}(-A) \right) + c. \]

However we have the next theorems.

**Theorem 2.**
Assuming \(q = e^{2\pi i A}, \text{Im}(A) > 0\), we have

\[\int_{\infty}^{-w(q)/(2\pi i) + c/(2\pi i)} G(F_1(t))dt = A. \quad (40)\]

Hence given \(G\) we can find \(w(q)\) and the opposite.

**Proof.**
Integrate (36).

**Theorem 3.**
Knowing \(G(A)\) (resp. \(w(q_A)\)) we can find \(w(q_A)\) (resp. \(G(A)\)) from Theorem 2 and then \(P(A)\) from the identity

\[G \left( F_1 \left( -\frac{w(q_A)}{2\pi i} + \frac{c}{2\pi i} \right) \right) = -P(A). \quad (41)\]

Also there exists the relations

\[w(q_A) = 2\pi i \int_{\infty}^{A} \frac{dt}{P(t)} \text{ and } P(A) = \frac{1}{q_A w'(q_A)}, \quad (42)\]

where \(q_A = e^{2\pi i A}, \text{Im}(A) > 0.\)
Theorem 4.
Given the function \( G(A) \) and assuming function \( y(A) \) is solution to the problem

\[
5 \int_0^{y(A)} \frac{G(t)}{t^{\sqrt{t-5} - 11 - t^5}} dt = A, \quad (43)
\]

then \( P(A) \) is such that

\[
P^{(-1)'}(A) = -A \frac{d}{dA} \left( F_1^{(-1)} \left( G^{(-1)}(-A) \right) \right), \quad (44)
\]
and \( y(A) \) is solution of the semialgebraic equation

\[
G(y(A)) + P(A) = 0. \quad (45)
\]
The function \( F_1(A) \) is the known function defined in (30),(31),(33). Also \( P(A) \) is given from

\[
P(A) = -\frac{1}{q_A w'(q_A)}, \quad q_A = e(A). \quad (46)
\]

Theorem 5.
If \( P(A) \) is the function (8), then the function

\[
w(q) = 2\pi i \int_{i\infty}^{z} \frac{dt}{P(t)}, \quad q = e(z), \quad Im(z) > 0, \quad (47)
\]
is the solution of

\[
\frac{w(q)}{f(w(q))} = q, \quad (48)
\]
where \( f(A) \) is given from

\[
f'(A) \frac{f(A)}{f(A)} = \frac{1}{A} + G \left( F_1 \left( -\frac{A}{2\pi i} + \frac{c}{2\pi i} \right) \right). \quad (49)
\]
Also then

\[
y(A) = F_1 \left( -\frac{w(q_A)}{2\pi i} + \frac{c}{2\pi i} \right). \quad (50)
\]

Theorem 6.
Assume that exists function \( P_0(A) \) such that

\[
G(A) = \frac{1}{c - 2\pi i F_1^{(-1)}(A)} + P_0 \left( c - 2\pi i F_1^{(-1)}(A) \right). \quad (51)
\]
Then

\[
y(A) = F_1 \left( -\frac{w(c^{2\pi i A})}{2\pi i} + \frac{c}{2\pi i} \right), \quad (52)
\]
where \( w(q) \) is solution of the equation
\[
 w(q) \exp \left( C - \int^w(q) P_0(t) dt \right) = q. \tag{53}
\]

**Theorem 7.**
It holds
\[
 F(z) = \frac{1}{2\pi i} w(q) + c_1, \quad q = e(z), \quad Im(z) > 0. \tag{54}
\]

We define the function \( g(A) \) to be
\[
 g(A) = A \exp \left( - \int^A P_0(t) dt \right) \tag{55}
\]
and \( P_0 \) defined as in Theorem 6. Then the relation
\[
 g^{(k)}(2\pi i (c_0 - c_1)) = (-1)^k g^{(k)}(0), \quad c_0 = -\frac{\sqrt{3}^{\frac{1}{3}}}{\pi \sqrt{2}}, \tag{56}
\]
is impossible.

**Remarks.**

i) Condition (56) is equivalent to say that \( g \) is analytic in \( D_0 \) and
\[
 g(2\pi i (c_0 - c_1) - z) = g(z), \quad \forall z \in D_0. \tag{57}
\]

ii) The set \( D_0 \) is subset of \( \mathbb{C} \) contaiing at least one circle with origin 0 and radius greater than \( 2\pi |c_0 - c_1| > 0 \).

**Proof.**
Assuming that (56) holds for every \( k = 0, 1, 2, \ldots \). We consider the Taylor series of \( g \) around 0 and \( 2\pi i (c_0 - c_1) \neq 0 \). We then have
\[
 e(Y(z)) = w(e(Y(z))) \exp \left( - \int^w(e(Y(z))) P_0(t) dt \right)
\]
and
\[
 e(Y(z)) = \sum_{k=0}^\infty \frac{g^{(k)}(2\pi i (c_0 - c_1))}{k!} (w(e(Y(z))) - 2\pi i (c_0 - c_1))^k =
\]
\[
 = \sum_{k=0}^\infty \frac{g^{(k)}(2\pi i (c_0 - c_1))}{k!} (2\pi i)^k (F(Y(z)) - c_0)^k =
\]
\[
 = \sum_{k=0}^\infty \frac{g^{(k)}(2\pi i (c_0 - c_1))}{k!} (-1)^k \left( 2\pi i F \left( Y \left( \frac{-1}{z} \right) \right) \right)^k
\]
\[
\begin{align*}
&= \sum_{k=0}^{\infty} \frac{g^{(k)}(2\pi i(c_0 - c_1))}{k!} (-1)^k \left( \left( e \left( Y \left( \frac{1}{z} \right) \right) \right)^k \right) \\
&= \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} \left( w \left( e \left( Y \left( \frac{1}{z} \right) \right) \right)^k \right) = e \left( Y \left( \frac{1}{z} \right) \right).
\end{align*}
\]

Hence \(2\pi Y \left( \frac{1}{z} \right) = 2\pi Y (z) + 2\pi ik_0, k_0 \in \mathbb{Z}\). Hence \(Y \left( \frac{1}{z} \right) = Y (z) + k_0\) and from relation (16)

\[ F (z) + F (k_0 + z) = c_0, \]

for all \(z \in D_0\). But from periodicity of \(\frac{1}{P(z)}\) we have the existence of another constant \(c_2\) such that \(F(z + 1) - F(z) = c_2\). Hence \(F(z + k_0) - F(z) = k_0 c_2\) and \(F(z) + k_0 c_2 + F(z) = c_0\). Hence \(F\) is constant.

**Example.**

Assume

\[ G(A) = -\frac{1}{c - 2\pi i F_1(A)} + \cos \left( c - 2\pi i F_1(A) \right). \]

Then \(P_0(A) = \cos A\), and the function \(y(A)\) such that

\[ 5 \int_0^y \frac{G(t)}{t \psi t - 5 - t^5} = A \]

is

\[ y(A) = F_1 \left( \frac{c}{2\pi i} - \frac{w(e(A))}{2\pi i} \right), \]

where \(w(q)\) is solution of

\[ w(q)e^{C_1 - \sin(w(q))} = q. \]

**Theorem 8.**

Assume the function \(h_0\) defined from the relations

\[ g^{(k)}(2\pi i(c_0 - c_1)) = (-1)^k g_2^{(k)}(0), c_0 = -\frac{\sqrt{3} \Gamma \left( \frac{1}{2} \right)}{\pi \sqrt{2}}, \quad (58) \]

where

\[ g_2(z) = h_0(g(z)). \quad (59) \]

Then if \(c_1\) denotes the constant \(c'_1 = F(z) - \frac{w(e(z))}{2\pi i}\) we have

\[ g(2\pi i(c_0 - c_1) - z) = h_0(g(z)), \quad (60) \]

\[ w(A) + w(h_0(A)) = c_2 = 2\pi i(c_0 - c_1) = \text{constant}, \quad (61) \]

\[ e \left( Y \left( \frac{1}{z} \right) \right) = h_0 \left( e \left( Y (z) \right) \right). \quad (62) \]
and
\[ h_0(h_0(z)) = z. \] (63)

**Proof.**
Relation (62) can be shown as in Theorem 7. For to show (61) we have
\[ F(z) = \frac{w(e(z))}{2\pi i} + c'_1 \]
and
\[ F(Y(z)) + F \left( Y \left( \frac{-1}{z} \right) \right) = c_0. \]
Hence
\[ w(e(Y(z))) + c'_1 + w \left( e \left( Y \left( \frac{-1}{z} \right) \right) \right) + c'_1 = c_0 \iff \]
\[ w(e(Y(z))) + w(h_0(e(Y(z)))) = c_0 - 2c'_1. \]
Hence
\[ w(A) + w(h_0(A)) = c_0 - 2c'_1 = 2\pi i(c_0 - c_1). \]
Setting where \( h_0 \to h_0^{(-1)} \) in the last equation, we have \( w(h_0^{(-1)}(A)) + w(A) = c_0 - 2c'_1 \). Hence
\[ w \left( h_0^{(-1)}(A) \right) = w(h_0(A)) \Rightarrow h_0(h_0(A)) = A. \]
QED.

**Theorem 9.**
We define the \( B \) function to be such
\[ h_0(A) = e(B(A)), \] (64)
and the \( \lambda \) function
\[ \lambda(A) = B(e(A)). \] (65)
Then
\[ \int_{i\infty}^{A} \frac{dt}{P(t)} + \int_{i\infty}^{\lambda(A)} \frac{dt}{P(t)} = c', \] (66)
\[ \lambda'(A) = -\frac{P(\lambda(A))}{P(A)}, \] (67)
\[ F(A) + F(\lambda(A)) = \text{constant}, \] (68)
\[ F(\lambda(\lambda(A))) = F(A), \] (69)
where \( F, \lambda \) are 1–periodic
\[ h_0(e(A)) = e(\lambda(A)). \] (70)
There exists always integer \( k = k(z) \) such that

\[ Y \left( \frac{-1}{z} \right) = \lambda(Y(z)) + k \quad (71) \]

and

\[ 2\pi i F(B(A)) + w(A) = c. \quad (72) \]

**Proof.**

It holds

\[ w(e(A)) + w(h_0(e(A))) = c_2 \implies 2\pi i \int_{i\infty}^{A} \frac{dt}{P(t)} + 2\pi i \int_{i\infty}^{B(e(A))} \frac{dt}{P(t)} = c_2 \implies \]

\[ \int_{i\infty}^{A} \frac{dt}{P(t)} + \int_{i\infty}^{\lambda(A)} \frac{dt}{P(t)} = \frac{c_2}{2\pi i}. \]

Setting \( A \to \lambda(A) \), we get

\[ \int_{i\infty}^{\lambda(A)} \frac{dt}{P(t)} = \int_{i\infty}^{A} \frac{dt}{P(t)} \implies \]

\[ \int_{i\infty}^{\lambda(A)} \frac{dt}{P(t)} = \int_{i\infty}^{A} \frac{dt}{P(t)}. \]

Hence

\[ F(\lambda(\lambda(A))) = F(A). \]

For (72) we have

\[ Y \left( \frac{-1}{A} \right) = F^{(-1)}(c_0 - F(Y(A))) \implies \]

\[ e \left( Y \left( \frac{-1}{A} \right) \right) = e \left( F^{(-1)}(c_0 - F(Y(A))) \right) \implies \]

\[ h_0(e(Y(z))) = e \left( F^{(-1)}(c_0 - F(Y(A))) \right) \implies \]

\[ h_0(e(A)) = e \left( F^{(-1)}(c_0 - F(A)) \right) \implies \]

\[ e(B(e(A))) = e \left( F^{(-1)}(c_0 - F(A)) \right) \implies \]

\[ B(e(A)) = F^{(-1)}(c_0 - F(A)) + k. \]

Hence if \( k = 0 \) we get

\[ F(B(e(A))) + F(A) = c_0 \implies \]

\[ (F \circ B)(e(B(A))) + (F \circ B)(A) = c_0 \implies \]
\[(F \circ B)(h_0(A)) + (F \circ B)(A) = c_0.\]

Hence we get the equation
\[2\pi i F(B(A)) + w(A) = c,\]
which is indeed true.

Now
\[F(B(qA)) = \frac{c}{2\pi i} - \frac{w(qA)}{2\pi i} = h_i(A) \Rightarrow \]
\[F(\lambda(A)) = h_i(A). \quad (73)\]

Hence \(h_i(A + 1) = h_i(A).\) Also
\[
\int_{Y(i\infty)}^{\lambda(A)} \frac{dt}{P(t)} = \int_{Y(i\infty)}^{i\infty} \frac{dt}{P(t)} + \int_{i\infty}^{\lambda(A)} \frac{dt}{P(t)} = h_i(A) \Rightarrow
\]
\[
\int_{Y(i\infty)}^{i\infty} \frac{dt}{P(t)} + \frac{c_0}{2\pi i} - \int_{i\infty}^{A} \frac{dt}{P(t)} = h_i(A) \Rightarrow
\]
\[h_i(A) = c' - \int_{i\infty}^{A} \frac{dt}{P(t)} \Rightarrow A = c' - \int_{i\infty}^{h(A)} \frac{dt}{P(t)} \Rightarrow
\]
\[h'(A) = -P(h(A)). \quad (74)\]

Also from (27):
\[w(qA) = -2\pi ih_i(A) + c\]
and from (61):
\[w(e(A)) + w(h_0(e(A))) = c_0 - 2c_1 \Rightarrow
\]
\[w(e(A)) + w(e(\lambda(A))) = c_0 - 2c_1 \Rightarrow
\]
\[-2\pi ih_i(A) - 2\pi ih_i(\lambda(A)) + 2c = c_0 - 2c_1.\]

Hence we get the next

**Theorem 10.**
We have
\[h_i(A) = F(\lambda(A)), \; h_i(A + 1) = h_i(A), \quad (74)\]
\[h'(A) = -P(h(A)), \; \lambda(A) = h(F(A)) \quad (75)\]
and
\[h_i(A) + h_i(\lambda(A)) = \frac{-c_0 + 2c_1 + 2c}{2\pi i}. \quad (76)\]

**Remark.** \(h_i(A)\) denotes inversion i.e. \(h_i(A) = h^{-1}(A), \; f'_i(A) = f^{(-1)'}(A), \ldots\)

e.tc.
Theorem 11.
There exists constants $c, c_1$ such that
\[
  h_i(A) = \frac{c}{2\pi i} - \frac{w(q_A)}{2\pi i} = \frac{c_1}{2\pi i} - F(A). \quad (77)
\]

About the "shape" of function $G$, we assume first that $G(F_1(A))$ is analytic
and set
\[
  H(z) := G(F_1(z)).
\]
Then
\[
  H(z + z_0) = \sum_{k=0}^{\infty} \frac{H^{(k)}(z_0)}{k!} z^k.
\]
Hence we can write
\[
  -P(A) = -\frac{1}{q_A w'(q_A)} = H \left( -\frac{w(q_A)}{2\pi i} + \frac{c}{2\pi i} \right) = \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k}{(2\pi i)^k} w(q_A)^k \Rightarrow
\]
\[
  -\frac{1}{A w'(A)} = \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k}{(2\pi i)^k} w(A)^k \Rightarrow
\]
\[
  -\frac{w(-1)'(A)}{w(-1)(A)} = \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k}{(2\pi i)^k} A^k \Rightarrow
\]
\[
  -\log w(-1)(A) = c + \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k A^{k+1}}{(2\pi i)^k (k+1)!} \Rightarrow
\]
\[
  w(-1)(A) = \exp \left( -c - A \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k A^k}{(2\pi i)^k (k+1)!} \right) \Rightarrow
\]
\[
  f(A) = A \exp \left( c + A \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k A^k}{(2\pi i)^k (k+1)!} \right).
\]
Hence given a function $G$, we can find $f$ setting $H(z) = G(F_1(z))$ and
\[
  f(A) = A \exp \left( c + A \sum_{k=0}^{\infty} \frac{H^{(k)} \left( \frac{c}{2\pi i} \right) (-1)^k A^k}{(2\pi i)^k (k+1)!} \right). \quad (78)
\]
However we have assumed that $f(0)$ is not zero around 0 "say" in $D \subset C$. Hence $G(F_1(A))$ must have a pole. We can write
\[
  G(F_1(A)) = -\frac{1}{c - 2\pi i A} + P_0(c - 2\pi i A), \quad (78.1)
\]
for some function $P_0(A)$. Then
\[
G(F_1(A)) = \frac{-1}{c - 2\pi iA} + \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c) (-1)^k (2\pi i)^k}{k!} A^k.
\]

That is because
\[
G \left( F_1 \left( \frac{c}{2\pi i} - \frac{A}{2\pi i} \right) \right) = -\frac{1}{A} + \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c) (-1)^k (2\pi i)^k}{k!} \left( \frac{c}{2\pi i} - \frac{A}{2\pi i} \right)^k = -\frac{1}{A} + P_0(A),
\]
which is true. Also
\[
\begin{align*}
-P(A) &= -\frac{1}{w(qA)} + P_0(w(qA)) \Leftrightarrow -\frac{1}{qAw'(qA)} = -\frac{1}{w(qA)} + P_0(w(qA)) \Leftrightarrow \\
-\frac{1}{Aw'(A)} &= -\frac{1}{w(A)} + P_0(w(A)) \Leftrightarrow -\frac{w^{(-1)'}(A)}{w^{(-1)}(A)} = -\frac{1}{A} + P_0(A) \Leftrightarrow \\
-\log w^{(-1)}(A) &= -\log A + \int_{C_1}^{A} P_0(t)dt + C_0 \Leftrightarrow \\
\frac{1}{w^{(-1)}(A)} &= e^{C_0} \frac{A}{e^{\int_{C_1}^{A} P_0(t)dt}} \Leftrightarrow w^{(-1)}(A) = Ae^{-C_0} \exp \left( -\int_{C_1}^{A} P_0(t)dt \right).
\end{align*}
\]

Hence
\[
f(A) = \exp \left( C_0 + \int_{C_1}^{A} P_0(t)dt \right) \Leftrightarrow \frac{f'(A)}{f(A)} = P_0(A).
\]

Hence if $f$ is analytic and not zero around 0, then so $P_0(A)$ is also analytic and we have the next

**Theorem 12.**

Assuming the problem (1),(2),(7), be well defined and in accordance with Ramanujan-Jacobi integral (43), the function $G(F_1(A))$ must be meromorphic with a single simple pole at $A_0 = \frac{c}{2\pi i}$. The constant $c$ is given by $c = w(e(X(0)))$. Moreover it holds
\[
G(F_1(A)) = \frac{-1}{c - 2\pi iA} + \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c) (-1)^k (2\pi i)^k}{k!} A^k, \quad (79)
\]

where
\[
f(A) = \exp \left( C_0 + \int_{C_1}^{A} P_0(t)dt \right) \Leftrightarrow \frac{f'(A)}{f(A)} = P_0(A). \quad (80)
\]
Hence setting $P_0(A) = \frac{f'(A)}{f(A)}$, then $G$ is given by (79) and the opposite.

**Theorem 13.**
If $D_1 = b_1^2 - 4a_1c_1$ and

$$U(x) = U(a_1, b_1; m; x) = (-1)^{m+1}a_1^{m-1}D_1^{-m+1/2}B_0 \left( \frac{-b_1 + \sqrt{D_1} - 2a_1x}{2\sqrt{D_1}}; 1 - m, 1 - m \right).$$

Then from [Bag]

$$\exp \left( 2\pi i \int_{\omega_1}^{\omega_2} \frac{f_1(t)}{(a_1t^2 + b_1t + c_1)^m} dt \right) = \exp \left( \frac{2\pi i}{2\pi} \int_{\omega_1}^{\omega_2} f_1(t) \right) = \exp \left( \frac{2\pi i}{2\pi} \int_{\omega_1}^{\omega_2} f_1(t) \right),$$

where

$$f_1(A) = -\frac{1}{c - 2\pi i U(A)} + P_0 \left( c - 2\pi i U(A) \right).$$

But $h'(A) = G(F_1(A)) = f_1(U^{(-1)}(A))$. Hence $P_0(A) = \frac{f'(A)}{f(A)}$ and $\frac{w(q)}{f(w(q))} = q$.

Therefore

$$f_1 \left( U^{(-1)} \left( \frac{c}{2\pi i} - \frac{A}{2\pi i} \right) \right) = -\frac{1}{A} + P_0(A).$$

Hence

$$f_1 \left( U^{(-1)}(A) \right) + \frac{1}{c - 2\pi i A} = \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c)}{k!} \frac{(-1)^k (2\pi i)^k}{A^k} \Rightarrow$$

$$h(A) = \frac{1}{2\pi i} \log \left( c - 2\pi i A \right) + A \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c)}{(k + 1)!} \frac{(-1)^k (2\pi i)^k}{A^k} + C_1$$

and

$$h^{(-1)}(A) = -\frac{w(qA)}{2\pi i} + \frac{c}{2\pi i}.$$

Hence we have the next theorem

**Theorem 13.1**
Assume the integral

$$\exp \left( 2\pi i \int_{\omega_1}^{\omega_2} \frac{f_1(t)}{(a_1t^2 + b_1t + c_1)^m} dt \right), \quad (82)$$
with \( f_1 \) known and of the form
\[
f_1 \left( U^{(-1)}(A) \right) = -\frac{1}{c - 2\pi i A} + P_0 \left( c - 2\pi i A \right),
\]
where \( D = b_1^2 - 4a_1c_1 \) and
\[
U(x) = U(a_1, b_1; m; x) := (-1)^{m+1}a_1^{-m-1}D^{-m+1/2}B_0 \left( \frac{-b_1 + \sqrt{D} - 2a_1x}{2\sqrt{D}}; 1 - m, 1 - m \right).
\]
Then exists function \( f \) such that
\[
f'(A) f(A) = P_0(A)
\]
and
\[
\exp \left( 2\pi i \int_{\omega_1}^{\omega_2} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt \right) = \frac{\exp \left( 2\pi i \left( h(U(\omega_2)) \right) \right)}{\exp \left( 2\pi i \left( h(U(\omega_1)) \right) \right)} = \frac{w(-1)(-2\pi i U(\omega_2) + c)}{w(-1)(-2\pi i U(\omega_1) + c)},
\]
where \( w \) is solution of the Lagrange equation
\[
\frac{w(A)}{f(w(A))} = A.
\]
Also then
\[
w(e(A)) = -2\pi i h^{(-1)}(A) + c,
\]
where
\[
h(A) = \frac{1}{2\pi i} \log (c - 2\pi i A) + A \sum_{k=0}^{\infty} \frac{P_0^{(k)}(c)(-1)^k(2\pi i)^k}{(k+1)!} A^k + C_1
\]
and \( C_1 \) being a constant.

**Theorem 13.2**

Given the functions \( f_1(A) \) and \( U(A) \) (\( U \) being that of (84)), such that
\[
f_1 \left( U^{(-1)} \left( \frac{c - A}{2\pi i} \right) \right)
\]
is meromorphic with only simple pole at \( A_0 = 0 \) and residue \(-1\) i.e. with Laurent expansion
\[
f_1 \left( U^{(-1)} \left( \frac{c}{2\pi i} - \frac{A}{2\pi i} \right) \right) = -\frac{1}{A} + P_0 (A),
\]
where \( P_0(A) = \frac{f'(A)}{f(A)} \) is analytic. Then with the notation of the remarks below we have
\[
\int_{-\rho_1 - \frac{\sqrt{D}}{a_1}}^{\rho_1 - \frac{\sqrt{D}}{a_1}} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = \frac{1}{2\pi i} \left[ \log \left( \frac{c - 2\pi it}{f(c - 2\pi it)} \right) \right]_{t=\Omega(z_2)}^{t=\Omega(z_1)}.
\]
The function $\Omega(z)$ is
\[
\Omega(z) := (-1)^{m+1} a_1^{m-1} D_1^{(-m+1/2)} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{1-z^2} \tag{92}
\]
and $\rho_1 = \frac{b_1 - \sqrt{D_1}}{2a_1}$.

Remarks.

i) Setting $B_\alpha(z) = \sqrt{B_0(z; \alpha, \alpha)}$, $0 < \alpha < 1$, the equation
\[
i \frac{B_{1-m}(1-t)}{B_{1-m}(t)} = z, \quad 0 < m < 1, \quad \text{Im}(z) > 0 \tag{92.1}
\]
have solution $t = \beta(z)$. For this solution holds
\[
B_0(\beta(z); 1-m, 1-m) = \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{1-z^2}. \tag{92.2}
\]
Also
\[
U \left( -\rho_1 - \frac{\sqrt{D_1}}{a_1} \beta(z) \right) = (-1)^{m+1} a_1^{m-1} D_1^{(-m+1/2)} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{1-z^2}. \tag{92.3}
\]

ii) Hence the beta functions $B_{1-m}(z)$ form (92.1). For $m$ rational in $0 < m < 1$, we have numerical evidences that $\beta(z)$ are algebraic numbers when $z = x + i\sqrt{y}$, $x, y$ rationals, with $y > 0$. Hence it is of interest to examine these functions. Also it is of interest to reduce the evaluation of general integrals such (91) with these simple functions.

iii) Therorem 13.2 tell us that if $f_1$ is a function such that $f_1 \circ U_i$ have simple Laurent expansion, then we can evaluate integral (91) using the analytic part $P_0$ of $f_1 \circ U_i$. The evaluation requires only the knowledge of $f$ and $\frac{f'(A)}{f(A)} = P_0(A)$.

iv) The problem also related with Ramanujan-Jacobi integrals (see relation (29) and [2]) and holds $h'(A) = G(F_1(A)) = f_1(U_i(A))$. This last equation and Theorem 2 give rise to Lagrange inversion formula, since it holds
\[
h \left( \frac{c}{2\pi i} - \frac{w(qA)}{2\pi i} \right) = A.
\]

Proof.

Assume the Lagrange equation
\[
\frac{w(A)}{f(w(A))} = A.
\]
We find $P_0(A)$ from
\[
P_0(A) = \frac{f'(A)}{f(A)}.
\]
Then holds the following integral
\[
\int_{U_1(a_1(z_2))}^{U_1(a_1(z_1))} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = z_2 - z_1 \quad \text{(93)}
\]
where
\[
f_1(A) = - \frac{1}{c - 2\pi iU(A)} + P_0(c - 2\pi iU(A)).
\]
and
\[
w(e(A)) = -2\pi ih_i(A) + c. \quad \text{(94)}
\]
Hence if we set \(A_2, A_1\) the values of (136) below we get
\[
\int_{-\rho_1 - \sqrt{\frac{\pi}{\alpha}}}^{\rho_1 + \sqrt{\frac{\pi}{\alpha}}} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = \frac{1}{2\pi i} \log \left( \frac{c - 2\pi iU(A_2)}{c - 2\pi iU(A_1)} \right) + \\
+ \sum_{k=0}^{\infty} \frac{D_1^k}{(k+1)!} (U(z_2)^{k+1} - U(z_1)^{k+1}). \quad \text{(94.1)}
\]
Hence if \(P_0^{(k)}(c) = P_1^{(k+1)}(c)\), then
\[
\int_{-\rho_1 - \sqrt{\frac{\pi}{\alpha}}}^{\rho_1 + \sqrt{\frac{\pi}{\alpha}}} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = \frac{1}{2\pi i} \log \left( \frac{c - 2\pi iU(A_2)}{c - 2\pi iU(A_1)} \right) - \\
- \frac{1}{2\pi i} \left[ P_1 \left( c - 2\pi i(-1)^{m+1} a_1^{m-1} D_1^{(m+1)/2} \frac{1}{\Gamma(2(1-m))} \frac{1}{1-t^2} \right) \right]_{t=z_2} \Rightarrow \\
\int_{-\rho_1 - \sqrt{\frac{\pi}{\alpha}}}^{\rho_1 + \sqrt{\frac{\pi}{\alpha}}} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = \frac{1}{2\pi i} \log \left( \frac{c - 2\pi iU(A_2)}{c - 2\pi iU(A_1)} \right) - \\
- \frac{1}{2\pi i} \int_{-2\pi i(-1)^{m+1} a_1^{m-1} D_1^{(m+1)/2} \frac{1}{\Gamma(2(1-m))} \frac{1}{1-t^2}} P_0(t+c) dt \Rightarrow \\
\int_{-\rho_1 - \sqrt{\frac{\pi}{\alpha}}}^{\rho_1 + \sqrt{\frac{\pi}{\alpha}}} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = \frac{1}{2\pi i} \log \left( \frac{c - 2\pi iU(A_2)}{c - 2\pi iU(A_1)} \right) - \\
- \frac{1}{2\pi i} \int_{-2\pi i(-1)^{m+1} a_1^{m-1} D_1^{(m+1)/2} \frac{1}{\Gamma(2(1-m))} \frac{1}{1-t^2}} P_0(t+c) dt = \frac{\pi}{\alpha}.
and indeed holds

\[ h - \frac{1}{2\pi i} \log \left( \frac{c - 2\pi i U(A_1)}{c - 2\pi i U(A_2)} \right) = \frac{1}{2\pi i} \log \left( \frac{f(c - 2\pi i(-1)^{m+1}a_1^{m-1}D_1^{(-m+1/2)} \Gamma(1-m)z}{f(c - 2\pi i(-1)^{m+1}a_1^{m-1}D_1^{(-m+1/2)} \Gamma(1-m)z)} \right). \]

Example.
If \( P_0(A) = 1 \), then we have \( f(A) = C_0 e^A \) and \( w_i(A) = C_0^{-1} A e^{-A} \), with \( w(A) = -W(-C_0 A) \) and \( W(A) \) is the Lambert’s function, \( C_0 = e^{-C} \).

\[ f_1(U_i(A)) = -\frac{1}{c - 2\pi i A} + 1 \Leftrightarrow f_1(A) = -\frac{1}{c - 2\pi i U(A)} + 1. \]

Also then

\[ \exp \left( 2\pi i \int_0^\omega \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} \, dt \right) = e(U(\omega)) (1 - 2\pi i e^{-1} U(\omega)). \]

On the other hand we have \( G(F_1(A)) = -\frac{1}{c - 2\pi i A} + 1. \) Hence

\[ G(A) = -\frac{1}{c - 2\pi i F_1^{(-1)}(A)} + 1. \]

The function \( h_0(A) \) is such that \( w(A) + w(h_0(A)) = c_{11} \). Hence

\[ h_0(A) := e^{C - c_{11} - W(-A e^{-C})} (c_{11} + W(-A e^{-C})) , \]

and indeed holds \( h_0(h_0(A)) = A \). The function \( y(A) \) is

\[ y(A) = F_1 \left( \frac{W(-q e^{-C})}{2\pi i} + \frac{c}{2\pi i} \right), q = e(A), \]

\[ F(A) = \frac{e_1 - c}{2\pi i} - \frac{W(q e^{-C})}{2\pi i}, q = e(A), \]

\[ P(A) = -\frac{1 + W(-q e^{-C})}{W(-q e^{-C})}, q = e(A). \]

Also from (88)

\[ h(A) = \frac{1}{2\pi i} \log \left( A - \frac{c}{2\pi i} \right) + A + C_1 \]

and from (24),(12)

\[ Y(A) = \frac{1}{2\pi i} \log \left( 2\sqrt{2} B_0 \left( m^*(2z)^2; \frac{1}{6}; \frac{2}{3} \right) - \frac{c}{2\pi i} \right) + \sqrt{2} B_0 \left( m^*(2z)^2; \frac{1}{6}; \frac{2}{3} \right) + C_1. \]

Note. Solving equation (9) with ”Mathematica” program (I have ”Mathematica 11”) requires some extra care when using the constants. Also mathematica does not recognizes \( W(x e^x) = x \) and it is beter to use \( 6A_1^{1/3}_2 F_1 \left( \frac{1}{6}; \frac{1}{6}; \frac{2}{3}; A^2 \right) \) in place of \( B_0 \left( A^2; \frac{1}{6}; \frac{2}{3} \right) \). A beter example is to take \( P_0(t) = \frac{1}{1+t} \), which is equivalent to \( f(A) = C(A + 1) \).
2 The real analog

Going from the complex to the real analog we have as in [Bag theta] an equation

\[
\frac{w(A)}{f(w(A))} = A,
\]

(95)

with \( f(A) \) analytic and \( f(0) \neq 0 \) arround 0. The equation ?? have solution

\[
w(q) = \sum_{n=1}^{\infty} c_n q^n, \ q = e^{-\pi \sqrt{A}}, \ A > 0.
\]

(96)

Then if

\[
a_n = c_n n
\]

(97)

\[
\frac{1}{P(A)} = \sum_{n=1}^{\infty} a_n q^n, \ q = e^{-\pi \sqrt{A}}, \ A > 0.
\]

(98)

Hence

\[
\int \frac{1}{qP(A)} dq = w(q) + c
\]

(99)

and

\[
P(A) = \frac{1}{qw'(q)}, \ q = e^{-\pi \sqrt{A}}, \ A > 0.
\]

(100)

Also

\[
-2P(A)h'_i(A) = 1
\]

(101)

and

\[
h_i(A) = \frac{1}{\pi^2} \sum_{n=1}^{\infty} \frac{a_n}{n^2} q^n + \frac{\sqrt{A}}{\pi} \sum_{n=1}^{\infty} \frac{a_n}{n} q^n =
\]

\[= c + \pi^{-2} \int q^{-1}w(q) dq - \pi^{-2} w(q) \log q =
\]

\[= c + \pi^{-2}w(q) \log q - \pi^{-2} \int w'(q) \log(q) dq - \pi^{-2} w(q) \log q \Rightarrow
\]

\[h_i(A) = c - \pi^{-2} \int w'(q) \log(q) dq
\]

(102)

and

\[h'_i(A) = -\frac{1}{2}e^{-\pi \sqrt{A}}w'(e^{-\pi \sqrt{A}}).
\]

(103)

The function \( X(A) \) is given from

\[
X(A) = h \left( \frac{1}{\sqrt{4}}B_0 \left( A^2; \frac{1}{6}, \frac{2}{3} \right) \right)
\]

(104)

and satisfies the equation

\[
X'(A) + \frac{2^{4/3}}{A^{2/3}(1 - A^2)^{1/3}} P(X(A)) = 0,
\]

(105)
which is equivalent to
\[ h'(A) + 2P(h(A)) = 0. \] (106)

The function
\[ Y(r) = X(k_r), \] (107)
satisfies
\[ Y'(r) - \frac{\pi}{\sqrt{r}} \eta(i\sqrt{r}/2)^4 P(Y(r)) = 0. \] (108)

Also if
\[ F(A) = \int_{X(0)}^{A} \frac{dt}{P(t)}, \] (109)

then
\[ F(Y(r)) = -\frac{2}{\sqrt{4}} B_0 \left( \frac{k_r^2}{6} \cdot \frac{2}{3} \right). \] (110)

and
\[ F(Y(4r)) + F \left( Y \left( \frac{4}{r} \right) \right) = c_0 = -\frac{\sqrt{3} \Gamma \left( \frac{1}{3} \right)}{\pi \sqrt{2}}. \] (111)

Moreover if \( G(A) \) is the function related with the Ramanujan-Jacobi inversion problem, then setting
\[ h_1(t) := \left( \frac{1}{h'_i(.)} \right)^{(1)}(t), \] (112)

we have
\[ G_i(x) = F_1 \left( \int_c^x \frac{h'_i(t)}{t} dt \right) \] (113)

and
\[ G^{(-1)}(-2x) = F_1 \left( \frac{-1}{2} \int_c^{P_i(x)} \frac{dt}{P(t)} \right). \] (114)

**Theorem 14.**
\[ w'(q) q = -2h'_i(A), q = e^{-\pi \sqrt{A}}, A > 0. \] (115)

Or equivalent
\[ h_i(A) = c - \frac{1}{2} \int w'(q) q dA = c' - \pi^2 \int w'(q) \log(q) dq = c' - \pi^{-2} C(q) \] (116)

Again from [2] Corollary 1 eq. 33, we have
\[ h_i(A) = 5 \int_0^{\psi(A)} \frac{dt}{t \sqrt{t^{-5} - 11 - t^5}}. \]

Hence if \( q = e^{-\pi \sqrt{A}} \), then
\[ 5 \int_0^{\psi(A)} \frac{dt}{t \sqrt{t^{-5} - 11 - t^5}} = c' - \pi^{-2} \int w'(q) \log(q) dq = \]
\[ = c - \frac{1}{2} \int w'(q)qdA \Rightarrow \]

\[ F_1 \left( c - \frac{1}{2} \int w'(q)qdA \right) = y(A) \tag{117} \]

But \( G(y(A)) = 1/h'_1(A) \). Hence

\[ G \left( F_1 \left( c - \frac{1}{2} \int w'(q)qdA \right) \right) = -2P(A). \tag{118} \]

Assume (in the same way as we did above) that

\[ G \left( F_1 (A) \right) = H(A), \]

where \( H(A) \) is analytic. Also set

\[ C(q) = \int w'(q) \log(q) dq = \int^q w'(t) \log(t) dt \tag{119} \]

and \( f(A) = e^{-P'_1(A)} \) analytic and not zero at the origin. Then

\[
C'(A) = w'(A) \log A \Rightarrow C'(w_i(A))w'_i(A) = w'(w_i(A)) \log(w_i(A))w'_i(A) \Rightarrow \\
C(w_i(A)) = \int \log(w_i(A)) dA + c_1 = \int \log \left( \frac{A}{f(A)} \right) dA + c_1 = \\
= \int \log(A) dA + P_i(A) + c_1. \tag{120}
\]

We have

\[ H(A) = \sum_{k=0}^{\infty} \frac{H^{(k)}(0)}{k!} A^k. \]

Setting \( A \to c - \frac{1}{2} \int w'(q)qdA \), we have

\[ G \left( F_1 \left( c - \frac{1}{2} \int w'(q)qdA \right) \right) = \sum_{k=0}^{\infty} \frac{H^{(k)}(0)}{k!} \left( c - \frac{1}{2} \int w'(q)qdA \right)^k \Rightarrow \]

\[ -2P(A) = \sum_{k=0}^{\infty} \frac{H^{(k)}(0)}{k!} \left( c' - \pi^{-2} \int w'(q)qdq \right)^k \Rightarrow \]

\[ \frac{-2}{w'(q)q} = \sum_{k=0}^{\infty} \frac{H^{(k)}(0)}{k!} \left( c' - \pi^{-2} C(q) \right)^k \Rightarrow \]

\[ \frac{-2}{w'(A)A} = \sum_{k=0}^{\infty} \frac{H^{(k)}(0)}{k!} \left( c' - \pi^{-2} C(A) \right)^k \Rightarrow \]
\[-2 \frac{w_i'(A)}{w_i(A)} = \sum_{k=0}^{\infty} \frac{H_k(0)}{k!} \left( c' - \pi^{-2} C(w_i(A)) \right)^k \Rightarrow \]
\[
\frac{w_i'(A)}{w_i(A)} = -\frac{1}{2} \sum_{k=0}^{\infty} \frac{H_k(0)}{k!} \left( c' - c_1 - \pi^{-2} \int \log(A)dA - \pi^{-2} P_1(A) \right)^k.
\]

Now if \(\xi\) is positive constant and \(x\) positive variable with \(0 < x < \xi\), then
\[
\log w_i(x) - \log w_i(\xi) = \]
\[-\frac{1}{2} \int_{\xi}^{x} \left\{ \sum_{k=0}^{\infty} \frac{H_k(0)}{k!} \left( c' - c_1 - \pi^{-2} \int \log(A)dA - \pi^{-2} P_1(A) \right)^k \right\} dA \Rightarrow \]
\[
w_i(x) = w_i(\xi) \times \exp \left( -\frac{1}{2} \int_{\xi}^{x} \left\{ \sum_{k=0}^{\infty} \frac{H_k(0)}{k!} \left( c' - c_1 - \pi^{-2} \int \log(A)dA - \pi^{-2} P_1(A) \right)^k \right\} dA \right).
\]

Finally
\[
f(x) = \frac{xf(\xi)}{\xi} \times \]
\[
\exp \left( -\frac{1}{2} \int_{\xi}^{x} \left\{ \sum_{k=0}^{\infty} \frac{H_k(0)}{k!} \left( c' - c_1 - \pi^{-2} \int \log(A)dA - \pi^{-2} P_1(A) \right)^k \right\} dA \right).
\]

Since the integral \(\int \log(A)dA\) is continuous and bounded in \([0, \xi]\) and \(P_1(A)\) analytic, we have \(f(0) = 0\), which is impossible. Hence \(G(F_1(A))\) is not analytic. However if we assume that
\[
G(F_1(A)) + \frac{2}{L(A)} = P_0^*(A),
\]
where \(L\) is a function such that
\[
L \left( c - \frac{1}{2} \int w'(q)qdA \right) = w(q)
\]
and \(P_0^*(A)\) analytic. Then
\[
G \left( F_1 \left( c - \frac{1}{2} \int w'(q)qdA \right) \right) + \frac{2}{w(q)} = P_0^* \left( c - \frac{1}{2} \int w'(q)qdA \right) \Rightarrow \]
\[
-2P(A) + \frac{2}{w(q)} = P_0^* \left( c' - \pi^{-2} \int w'(q)\log(q) dq \right) \Rightarrow \]
\[- \frac{2}{w'(q)q} + \frac{2}{w(q)} = P_0^* \left( c' - \pi^{-2} C(q) \right) \Rightarrow \]
\[-2 \frac{w_i'(A)}{w_i(A)} + \frac{1}{A} = P_0^* \left( c' - \pi^{-2} C(w_i(A)) \right) \Rightarrow \]
\[
22}

\[-2 \log (w_i(t)) + 2 \log t \big|_{t=\xi}^{t=A} = \int_{\xi}^{A} P_0^* \left( c' - \pi^{-2} C(w_i(t)) \right) dt \Rightarrow \]

\[-2 \log \left( \frac{w_i(A)}{A} \right) + 2 \log \left( \frac{w_i(\xi)}{\xi} \right) = \]

\[= \int_{\xi}^{A} P_0^* \left( c' - c_1 - \pi^{-2} \int \log(t) dt - \pi^{-2} P_1(t) \right) dt \Rightarrow \]

\[\log(f(A)) - \log(f(\xi)) = \]

\[= \frac{1}{2} \int_{\xi}^{A} P_0^* \left( c' - c_1 - \pi^{-2} \int \log(t) dt - \pi^{-2} P_1(t) \right) dt \Rightarrow \]

\[f(A) = f(\xi) \exp \left( \frac{1}{2} \int_{\xi}^{A} P_0^* \left( c' - c_1 - \pi^{-2} \int \log(t) dt - \pi^{-2} P_1(t) \right) dt \right) \]

Hence we get the next

**Theorem 15.**

If we assume the problem

\[ \frac{w(q)}{f(w(q))} = q, \quad q = e^{-\pi \sqrt{r}}, \quad r > 0, \quad (121) \]

where \( f \) is analytic around 0 and \( f(0) \neq 0 \) and assume the solution is

\[ w(q) = \sum_{n=1}^{\infty} c_n q^n. \quad (122) \]

Setting \( a_n = n c_n \), we define

\[ \frac{1}{P(A)} = \sum_{n=1}^{\infty} a_n q^n. \quad (123) \]

Hence, we define a connection of the Lagrange problem with the Hauptmodul and the Ramanujan-Jacobi problem as described in the above notes of present article (see also [2],[3]). The connection of Ramanujan-Jacobi problem and the Hauptmodul general problem is

\[ G_i(-2x) = F_1 \left( -\frac{1}{2} \int_{c}^{P_i(x)} \frac{dt}{P(t)} \right). \quad (124) \]

Then in order the above problem to be well defined, function \( G(F_1(A)) \) must be of the form

\[ G(F_1(A)) = -\frac{2}{L(A)} + P_0^* (A), \quad (125) \]

23
where $P_0^*(A)$ is analytic in an interval containing 0 and $L(A)$ must satisfy

$$L \left( c - \frac{1}{2} \int w'(q)q dA \right) = w(q).$$

(126)

Also if $\xi$ is suitable positive constant and $x > 0$, then setting $f(A) = e^{-P_i(A)}$, we have

$$f(A) = f(\xi) \exp \left( \frac{1}{2} \int^A \! \! P_0^* \left( c' - c_1 - \pi^{-2} \int \log(t) dt - \pi^{-2} P_1(t) \right) dt \right).$$

(127)

The function $L(A)$ can be written as

$$L_i(w(q)) = c - \frac{1}{2} \int w'(q)q dA \Rightarrow L_i(w(q))w'(q)q \frac{-\pi}{2\sqrt{A}} = -\frac{1}{2} w'(q)q \leftrightarrow$$

$$L'_i(w(q)) = 1 - \pi^2 L'_i(w(q)) = -\pi \sqrt{A} = \log q \leftrightarrow$$

$$L'_i(q) = -\frac{1}{\pi^2} \log(w_i(q)) \leftrightarrow L'_i(A) = -\frac{1}{\pi^2} \log A.$$

Hence we get the next

**Theorem 16.**

$$L_i(A) = -\pi^{-2} \int \log \left( \frac{A}{f(A)} \right) dA + c.$$  

(128)

**Theorem 17.**

If we set

$$S(A) := \frac{\pi^{-2}}{2} P_0^* (A),$$

(129)

then

$$\frac{L''(A)}{L'(A)^3} + \frac{\pi^{-2}}{L(A)} = S(A).$$

(130)

**Proof.**

We have

$$-\frac{2}{w'(q)q} + \frac{2}{w(q)} = P_0^* (c' - \pi^{-2} C(q)) \leftrightarrow$$

$$-\frac{2}{w'(q)q} + \frac{2}{w(q)} = P_0^* (L_i(w(q))) \leftrightarrow$$

$$-2 \log q + 2 \log(w(q)) = \int_{c_1}^{w(q)} P_0^* (L_i(t)) dt \leftrightarrow$$

24
\[-2 \log w_i(A) + 2 \log A = \int P_0^*(L_i(A)) \, dA \iff 2 \log(f(A)) = \int P_0^*(L_i(A)) dA \iff 2 \log(f(A)) = \int P_0^* \left( \pi^{-2} \int \log \left( \frac{f(A)}{A} \right) \right) dA.\]

Set $S(A) := \frac{\pi^{-2}}{2} P_0^*(A)$. Then

\[L_i'(A) = \int S(L_i(A)) dA - \pi^{-2} \log A \Rightarrow L_i''(A) = S(L_i(A)) - \frac{\pi^{-2}}{A}.\] (131)

Hence if $u(x) := L_i(x)$, then

\[
\frac{d}{dA}(u''(A)A) = \frac{d}{dA}(S(u(A))A) \Rightarrow u''(A) - S(u(A)) + A[u'''(A) - S'(u(A))u'(A)] = 0.\] (132)

A solution of (132) is

\[u_i(A) = \int_c^A \frac{dt}{c_1 - \log t + \int S_1(t) dt}.\]

However if we set $A \rightarrow L(A)$ in (131), then

\[- \frac{L''(A)}{L'(A)^2} + \frac{\pi^{-2}}{L(A)} = S(A).\]

Remarks.

Hence if exists $S_1(A)$ such that

\[- \frac{u''(A)}{u_i(A)^3} + \frac{1}{u_i(A)} = S_1(u_i(A)) = S(A),\]

we get solving the first equality

\[u_i(A) = \int_{c_0}^A \frac{dt}{c_1 - \log t + \int S_1(t) dt}.\]

Hence

\[S_1 \left( \int_{c_0}^A \frac{dt}{c_1 - \log t + \int S_1(t) dt} \right) = S(A).\]

Now set the functions $S, S_0$ such that

\[u_i''(A) = S(u_1(A)) - \frac{1}{A} \quad (133)\]
and
\[ u''_2(A) = S_0(u_2(A)). \] (134)

Hence
\[ u_2^{(-1)}(x) = \int_{c_1}^{x} \frac{dt}{\sqrt{2 \int_{c_2}^{t} S_0(t_1)dt_1}}. \]

But equation (133) can be written as
\[ -\frac{u_1^{(-1)''}(A)}{u_1^{(-1)'}(A)^3} + \frac{1}{u_1^{(-1)}(A)} = S(A) = S_1(u_1^{(-1)}(A)) \]
and have solution
\[ u_1^{(-1)}(A) = \int_{c_0}^{A} \frac{dt}{c_1 - \log t + \int S_1(t)dt}. \]

However \( u_1^{(-1)}(A) = u_2^{(-1)}(A) \). Hence
\[ \int_{c_1}^{A} \frac{dt}{\sqrt{2 \int_{c_2}^{t} S_0(t_1)dt_1}} = \int_{c_0}^{A} \frac{dt}{c_1 - \log t + \int S_1(t)dt} \Rightarrow \]
\[ S_1 \left( \int_{c_0}^{A} \frac{dt}{c_1 - \log t + \int S_1(t)dt} \right) = S(A) = S_1 \left( \int_{c_1}^{A} \frac{dt}{\sqrt{2 \int_{c_2}^{t} S_0(t_1)dt_1}} \right). \]
However the solution of (130) is not an easy problem and it might be unsolved.

Now assume that \( m \) is rational and set
\[ B_\alpha(x) := \sqrt{B_0(x, \alpha, \alpha)} = \sqrt{\int_0^x (t^2 - t^2)^{\alpha-1}dt}. \]

It is known that
\[ \int_{z_1}^{z_2} \frac{dt}{(at^2 + bt + c)^m} = U(a, b, c; m; z_2) - U(a, b, c; m; z_1). \] (135)

Also if
\[ A_1 = -\rho_1 - \frac{\sqrt{D}}{a} \beta_1, \quad A_2 = -\rho_1 - \frac{\sqrt{D}}{a} \beta_2, \] (136)
where \( \rho_1 = \frac{b-\sqrt{D}}{2a} \) and \( \beta_1, \beta_2 \) are solutions of
\[ \frac{B_{1-m}(1 - \beta_{1,2})}{B_{1-m}(\beta_{1,2})} = \sqrt{r_{1,2}}, \] (137)
(if \( r \) is positive rational, then \( \beta_r \) is algebraic), we have

\[
\int_{A_1}^{A_2} \frac{dt}{(at^2 + bt + c)^m} = (-1)^{m+1} a^{m-1} D^{-m+1/2} B_{1-m} (\beta_{r_2})^2 - (-1)^{m+1} a^{m-1} D^{-m+1/2} B_{1-m} (\beta_{r_1})^2.
\]

But one can easily see that

\[
B_\alpha(z) + B_\alpha(1-z)^2 = \int_0^1 (t(1-t))^\alpha dt = \frac{\Gamma(\alpha)^2}{\Gamma(1-\alpha)}.
\]

Setting \( z = \beta_r \) in the above formula we have

\[
B_\alpha(1-\beta_r) \quad \text{and} \quad B_\alpha(\beta_r) = \sqrt{r}
\]

and

\[
B_\alpha(\beta_r) = \sqrt{\frac{\Gamma(\alpha)^2}{\Gamma(2\alpha)(r+1)}} \quad \text{(138)}
\]

and also

\[
B_\alpha(\beta_{n^2r}) = \sqrt{\frac{r+1}{n^2r+1}} B_\alpha(\beta_r). \quad \text{(139)}
\]

Hence we get the next

**Theorem 18.**

If \( r_1, r_2 \) are rational and \( A_1, A_2 \) are that of (136) with \( \beta_{r_1}, \beta_{r_2} \) the algebraic solutions of (137), then

\[
\int_{A_1}^{A_2} \frac{dt}{(at^2 + bt + c)^m} = (-1)^{m+1} a^{m-1} D^{-m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \left( \frac{1}{r_2+1} - \frac{1}{r_1+1} \right).
\]

Assuming \( r_2 = r \) and \( r_1 = +\infty \) we have

\[
\int_{-r_i}^{-r_{i-1}} \frac{dt}{(at^2 + bt + c)^m} = (-1)^{m+1} a^{m-1} D^{-m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{r+1}.
\]

But it holds (see [2]) \( h'(A) = G(F_1(A)) = f_1(U_i(A)) \). Hence from Theorem 16 we have

\[
h'(A) = -\frac{2}{L(A)} + P_0^*(A) \Rightarrow h(U(A)) = -2 \int_{C}^{U(A)} \frac{dt}{L(t)} + \int_{C}^{U(A)} P_0^*(t) dt,
\]

where \( U(A) \) is that of (84). Hence we have the next
Theorem 19.
i) Assume $P_0^*(A)$ is given analytic function. Then if
\[ f_1(t) = -\frac{2}{L(U(t))} + P_0^*(U(t)), \]  
we have
\[ \int_{A_1}^{A_2} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = -2 \int_{U(A_1)}^{U(A_2)} \frac{dt}{L(t)} + \int_{U(A_1)}^{U(A_2)} P_0^*(t) dt. \]  
The function $L(A)$ is determined from Theorem 18 equation (130).

ii) If we know $f(A)$ we find $L(A)$ from Theorem 13 and $P_0^*(A)$ from Theorem 14. Hence for $f_1(A)$ we can evaluate the integral.

Theorem 20.
Assume $f_1, L, P_0^*$ are as in above theorem. Then
\[ \int_{A_1,2} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = -2 \int_{U(A_1)}^{U(A_2)} \frac{dt}{L(t)} + \int_{U(A_1)}^{U(A_2)} P_0^*(t) dt, \]  
where
\[ U(A_{1,2}) = (-1)^{m+1} a_1^{m-1} D_1^{m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} + \frac{1}{r_{1,2} + 1}. \]  
Continuing from Theorem 17 we can write
\[ \int_{A_1}^{A_2} \frac{f_1(t)}{(a_1 t^2 + b_1 t + c_1)^m} dt = -2 \int_{U(A_1)}^{U(A_2)} \frac{dt}{L(t)} + \int_{U(A_1)}^{U(A_2)} 2\pi^2 \left( \frac{L''(t)}{L(t)^3} + \frac{\pi}{L(t)} \right) dt = \]
\[ = -2\pi^2 \int_{U(A_1)}^{U(A_2)} \frac{L''(t)}{L(t)^3} dt = \pi^2 \left( \frac{1}{L'(U(A_2))^2} - \frac{1}{L'(U(A_1))^2} \right). \]
Also
\[ f_1(A) = \pi^2 \left( \frac{d}{dt} \frac{1}{L'(t)^2} \right)_{t=U(A)} . \]
The above will help in the proof of the next
Theorem 21.
Assume that $f_1$ is any smooth function and
\[ f_1(A) = \pi^2 \left( \frac{d}{dt} \frac{1}{L'(t)^2} \right)_{t=U(A)}. \quad (146) \]
Knowing $L'_i(A)$ and hence $f(A)$ from (158), if the solution of
\[ \frac{w(A)}{f(w(A))} = A \quad (147) \]
is known (i.e. $w(A)$ is known), we can assume that $R_{1,2}$ are solutions of the equation
\[ c - \frac{1}{2} \int_{c_0}^{R_{1,2}} \frac{dt}{P(t)} = (-1)^{m+1} a_1^{-m-1} D_1^{m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{r_{1,2}+1}. \quad (148) \]
However $\beta_{r_1,2}$ are solutions of (137) and we finally have
\[ \int_{-\rho_1 - \sqrt{\rho_1}}^{\rho_2} f_1(t) \frac{dt}{(a_1 t^2 + b_1 t + c_1)^m} = R_2 - R_1. \quad (149) \]

Proof.
Given any $f_1(A)$ we have
\[ \int_{U_i(A_2)}^{U_i(A_1)} f_1(t) \frac{dt}{(a_1 t^2 + b_1 t + c_1)^m} = \pi^2 \left( \frac{1}{L'(A_2)^2} - \frac{1}{L'(A_1)^2} \right), \quad (150) \]
where $f_1$ and $L$ are related as
\[ f_1(A) = \pi^2 \left( \frac{d}{dt} \frac{1}{L'(t)^2} \right)_{t=U(A)}. \quad (151) \]
But from equation (155) below we have
\[ \int_{U_i(A_2)}^{U_i(A_1)} f_1(t) \frac{dt}{(a_1 t^2 + b_1 t + c_1)^m} = A_2 - A_1, \quad (152) \]
Assume that $R_{1,2}$ are solutions of
\[ c - \frac{1}{2} \int_{c_0}^{R_{1,2}} w'(q)qdA = (-1)^{m+1} a_1^{-m-1} D_1^{m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2(1-m))} \frac{1}{r_{1,2}+1} \quad (153) \]
and $\beta_{r_1,2}$ are solutions of (137). Then
\[ U_i \left( c - \frac{1}{2} \int_{c_0}^{R_{1,2}} w'(q)qdA \right) = \]
\[
U_i \left( (-1)^{m+1} a_1^{m-1} D_1^{m+1/2} \frac{\Gamma(1-m)^2}{\Gamma(2-1-m)} \frac{1}{r_{1,2} + 1} \right) =
\]
\[
= -\rho_1 - \sqrt{D_1} a_1 \beta_{r_{1,2}}.
\]

Hence we get the proof of the theorem.

**Remarks.**

We have

\[G(y(A)) = 1/h'_i(A).\]

Hence

\[
5 \int_0^{y(A)} \frac{dt}{t^5 - 11 - t^5} = h_i(A) \iff F_i(h_i(A)) = y(A) \iff
\]
\[
F_i \left( c - \frac{1}{2} \int w'(q)qdA \right) = y(A) \Rightarrow
\]
\[
G \left( F_i \left( c - \frac{1}{2} \int w'(q)qdA \right) \right) = 1/h'_i(A) = -\frac{2}{w'(q)q} \Rightarrow
\]
\[
G(y(A)) + 2P(A) = 0
\]

Also

\[G(F_i(A)) = -\frac{2}{L(A)} + P^*_0(A)\]

\[f_1(U_i(A)) = h'(A) = \pi^2 \frac{d}{dA} \frac{1}{(L'(A))^2} \iff
\]
\[
h(A) = \frac{\pi^2}{L'(A)^2} + c_1.
\]  \hspace{1cm} (154)

But differentiating (126) we have

\[
L' \left( c - \frac{1}{2} \int w'(q)qdA \right) = \frac{\pi}{\sqrt{A}}
\]  \hspace{1cm} (155)

Setting in (146) \( A \to c - \frac{1}{2} \int w'(q)qdA \) and using (147) we get

\[h \left( L_i(w(q)) \right) = A + c \]  \hspace{1cm} (156)

But again from (146)

\[h \left( L_i(A) \right) = \pi^2 L'_i(A)^2 + c_1 \Rightarrow \pi^2 L'_i(w(q))^2 + c_1 = A + c \Rightarrow
\]
\[
L'_i(w(q)) = \pi^{-1} \sqrt{A + c}
\]

One can see that the constant \( c' \) is zero and we have

\[L'_i(w(q)) = \frac{\sqrt{A}}{\pi}\]  \hspace{1cm} (157)
Also from (148)

\[ h'(L_i(w(q)))L'_i(w(q))w'(q)q \frac{-\pi}{2\sqrt{A}} = 1 \Rightarrow \]

\[ h'(L_i(w(q)))\sqrt{\frac{A}{\pi}}w'(q)q \frac{-\pi}{2\sqrt{A}} = 1 \Rightarrow \]

\[ h'(L_i(w(q))) = -\frac{2}{qw'(q)} = \frac{1}{h'_i(A)} \Rightarrow L_i(w(q)) = h_i(A). \]

Hence \( c = 0 \) and

\[ w(q) = L(h_i(A)) \Rightarrow \frac{L(h_i(A))}{f(L(h_i(A)))} = q = e^{-\pi\sqrt{A}} \Rightarrow \]

\[ \frac{L(A)}{f(L(A))} = e^{-\pi\sqrt{h(A)}} \Leftrightarrow \frac{L(A)}{f(L(A))} = e^{-\pi^2/L'(A)} \Leftrightarrow \]

\[ \frac{A}{f(A)} = e^{-\pi^2L_i(A)}. \] (158)

3 The case of knowing \( P(A) \) and \( \int \frac{1}{P(A)} dA \)

In this section we shall consider given the function \( P(A) \) and knowing only the integral \( \int \frac{1}{P(A)} dA \) how to evaluate all the aspects of the previous paragraph.

Assuming \( P(A) \) and \( \int \frac{1}{P(A)} dA \) we can find the function \( w(q) \) such that

\[ w(q) = 2\pi i \int_{i\infty}^{A} \frac{dt}{P(t)}, \ q = e(A) \] (159)

Also from equation

\[ -\int_{i\infty}^{A} \frac{dt}{P(t)} = F_i^{(-1)} \left( G_i^{(-1)} (-P(A)) \right) \] (160)

we can easily find by inversion the function \( G(A) \). Also by inversion we can find \( f(A) \):

\[ f(A) = \frac{A}{w(-1)(A)}. \] (161)

Assuming that \( f(A) \) is not zero and analytic around the origin, all the other quantities such as \( X(A), Y(A), h(A) \), are obtained from the relations of the above paragraph. This implies that \( w^{(-1)}(0) = 0 \) and \( w^{(-1)'}(0) \neq 0, \ldots \) etc.
References
