Abstract

Based on an ordering with directed lines and using constructions instead of existential axioms, von Plato proposed a constructive axiomatization of ordered affine geometry. There are 22 axioms for the ordered affine geometry, of which the axiom I.7 is about the convergence of three lines (ignoring their directions). In this paper, we indicate that the axiom I.7 includes much redundancy, and demonstrate that the complicated axiom I.7 can be replaced with a simpler and more intuitive new axiom (called ODO) which describes the properties of oppositely and equally directed lines. We also investigate a possibility to replace the axiom I.6 with ODO.

Keywords: the order affine geometry, axiomatization, natural deduction, automated theorem proving, the first order logic.

1 Introduction

Heyting proposed the constructive axiomatization for the elementary geometry [1]. He adopted the concepts of distinct points and distinct lines rather than the concepts of equal points and lines. von Plato proposed the axioms of constructive geometry for which he introduced the concepts of convergent lines instead of parallel lines and of apartness of a point from a line instead of incidence of a point with a line [2, 3]. Recently, he presented a constructive theory of ordered affine geometry [4].

Automated theorem proving makes a great progress [5, 6, 7, 8]. McCune proved that Robbins algebras are Boolean with the theorem prover EQP [8]. Since the problem was posed by Herbert Robbins in the 1930s, it was conjectured that all Robbins algebras are Boolean algebras.

By using theorem prover ANDP [9, 10], we found a natural deduction of Halting problem [11], and simplified von Plato's axiomatization of constructive apartness geometry and orthogonality [12, 13], and indicated that the equality axioms are not independent [14].

In this paper, we simplify the axiomatization for ordered affine geometry by using theorem prover. We indicate that the axiom 1.7 includes some redundancy and show that the complicated axiom I.7 can be replaced with a simpler and more intuitive new axiom.

2 Simplifying the axiomatization for von Plato's order affine geometry

The five basic relations DiPt, DiLn, Undir, L-Apt, and L-Con and four constructions $\ln(a, b)$, $\text{pt}(a, b)$, $\text{par}(l, m)$, and $\text{rev}(l)$ are used to describe the axiom-

atization for the order affine geometry [4]. In total, von Plato's axiomatization has 22 axioms [4].

In this paper, we want to replace the axiom I.7 with a simpler and more intuitive new axiom. Only four axioms I.5 to I.8 are concerned in this paper. Only a basic relation $\text{Undir}(l, m)$ and only a construction $\text{rev}(l)$ appear in the axioms I.5 to I.8.

$\text{Undir}(l, m)$ means l and m are unequally directed lines.
 $\text{rev}(l)$ stands for the reverse of line l .

2.1 List the four axioms I.5 to I.8 as follows.

The axiom I.5,

$$\sim \text{Undir}(l, l). \quad (1)$$

The axiom I.6:

$$\text{Undir}(l, m) \longrightarrow \text{Undir}(l, n) \vee \text{Undir}(m, n) \quad (2)$$

The axiom I.7:

$$\begin{aligned} & \text{Undir}(l, m) \& \text{Undir}(l, \text{rev}(m)) \\ \longrightarrow & \text{Undir}(l, n) \& \text{Undir}(l, \text{rev}(n)) \vee \text{Undir}(m, n) \& \text{Undir}(m, \text{rev}(n)). \end{aligned} \quad (3)$$

The convergence $\text{Con}(l, m)$ is defined by means of the basic relation Undir as $\text{Undir}(l, m) \& \text{Undir}(l, \text{rev}(m))$ [4]. Thus, $\text{Con}(l, m)$ means that l and m are convergent lines. Note that directions of lines l and m are ignored for $\text{Con}(l, m)$. And then by means of the definition of $\text{Con}(l, m)$, the axiom I.7 can be shortened as

$$\text{Con}(l, m) \longrightarrow \text{Con}(l, n) \vee \text{Con}(m, n). \quad (4)$$

From Eq. (4), one can see that the axiom I.7 describes the convergence of three lines (the direction is ignored)

The axiom I.8,

$$\text{Undir}(l, m) \vee \text{Undir}(l, \text{rev}(m)) \quad (5)$$

In [4], the new relation $\text{Inopp}(l, m)$ was defined as $\text{undir}(l, \text{rev}(m))$. By means of the definition of Inopp , the axiom I.8 can be written as $\text{Undir}(l, m) \vee \text{Inopp}(l, m)$.

2.2 The axiom I.7 is complicated and includes much redundancy

The axiom I.7 can be rewritten equivalently as $W1 \& W2 \& W3 \& W4$, where

$$W1 = \sim Undir(l, m) \vee \sim Undir(l, rev(m)) \quad (6)$$

$$\vee Undir(l, n) \vee Undir(m, n),$$

$$W2 = \sim Undir(l, m) \vee \sim Undir(l, rev(m)) \quad (7)$$

$$\vee Undir(l, n) \vee Undir(m, rev(n)),$$

$$W3 = \sim Undir(l, m) \vee \sim Undir(l, rev(m)) \quad (8)$$

$$\vee Undir(l, rev(n)) \vee Undir(m, n),$$

$$W4 = \sim Undir(l, m) \vee \sim Undir(l, rev(m)) \quad (9)$$

$$\vee Undir(l, rev(n)) \vee Undir(m, rev(n)).$$

The classical concepts *Opp* and *Dir* are defined by means of the basic relation *Undir* [4]. *Opp*(x, y) is defined as $\sim Undir(x, rev(y))$. Thus, *Opp*(x, y) means that the lines x and y are oppositely directed lines. *Dir*(x, y) is defined as $\sim Undir(x, y)$. Thus, *Dir*(x, y) means that x and y are equally directed lines.

By means of the definitions of *Dir* and *Opp*, W1, W2, W3, and W4 can be rewritten as

$$W1 = Dir(l, n) \& Dir(m, n) \longrightarrow Dir(l, m) \vee Opp(l, m), \quad (10)$$

$$W2 = Dir(l, n) \& Opp(m, n) \longrightarrow Dir(l, m) \vee Opp(l, m), \quad (11)$$

$$W3 = Opp(l, n) \& Dir(m, n) \longrightarrow Dir(l, m) \vee Opp(l, m), \quad (12)$$

$$W4 = Opp(l, n) \& Opp(m, n) \longrightarrow Dir(l, m) \vee Opp(l, m). \quad (13)$$

One can see that W1 in Eq. (10) means that if l and n are equally directed line and m and n are equally directed lines, then lines l and m are equally directed lines or oppositely directed lines. One can know that it is impossible for both *Dir*(l, m) and *Opp*(l, m) happen. By means of the axiom I.6, one can know that lines l and m are equally directed lines. Furthermore, from Eqs. (2, 6), clearly the axiom I.6 implies W1. Thus, W1 is redundant.

W2 in Eq. (11) means that if l and n are equally directed line and m and n are oppositely directed lines, then lines l and m are equally directed lines or oppositely directed lines. One can know that it is impossible for both *Dir*(l, m) and *Opp*(l, m) happen. Factually, lines l and m should be oppositely directed lines. It means that W2 includes the redundancy.

W3 in Eq. (12) means that if l and n are oppositely directed line and m and n are equally directed lines, then lines l and m are equally directed lines or oppositely directed lines. It is impossible for both *Dir*(l, m) and *Opp*(l, m) happen. Factually, lines l and m should be oppositely directed lines. It means that W3 includes the redundancy.

W4 in Eq. (13) means that if l and n are oppositely directed line and m and n are oppositely directed lines, then lines l and m are equally directed lines or oppositely directed lines. It is impossible for both *Dir*(l, m) and *Opp*(l, m) happen. Factually, lines l and m should be equally directed lines.

By other hand, the theorem prover ANDP finds a natural deduction of W4 from only the axiom I-6. It means that the axiom I.6 implies W4 also. Thus, W4 is redundant.

2.3 The axiom I.7 can be replaced with the following simpler and more intuitive new axiom called ODO.

ODO:

$$\sim Undir(l, rev(m)) \& \sim Undir(l, n) \longrightarrow \sim Undir(m, rev(n)). \quad (14)$$

By means of the definitions of Opp and Dir, ODO becomes

$$Opp(l, m) \& Dir(l, n) \longrightarrow Opp(m, n), \quad (15)$$

which is just Theorem 3.5 [4]. Thus, ODO means that if l and m are oppositely directed lines and l and n are equally directed lines, then m and n are oppositely directed lines.

Theorem 1. Let the new axiomatization 1 be obtained from von Plato's one by replacing axiom I.7 with ODO. Then, the new axiomatization 1 is equivalent to von Plato's one.

Proof. It is known that ODO can be derived from von Plato's axiomatization. Conversely, we can derive the axiom I.7 from the new axiomatization 1 as follows.

To reduce the difficulty to derive the axiom I.7, we consider W1, W2, W3, and W4 in Eqs. (6, 7, 8, 9). In stead of finding a deduction of the axiom I.7, we only need to find deductions of W1, W2, W3, and W4, respectively. After lots of trials, the natural deductions of W1, W2, W3, and W4 are obtained as follows.

W1 is derived from only the axiom I.6 without using other axioms. Ref. Appendix A.

W2 is derived from the axioms I.5, I.6, and ODO without using other axioms. Ref. Appendix B.

W3 is derived from the axioms I.5, I.6, ODO without using other axioms. Ref. Appendix C.

W4 is derived from only the axiom I.6 without using other axioms. Ref. Appendix D.

3 Automated natural deduction

The the natural deduction is adapted from Gentzen system. We push quantifiers inside as possible as we can in our theorem prover ANDP. Thus, we can have more chances to apply rules for propositional logic. ANDP uses the following rules [9].

The rules for propositional logic:

MP (modus ponens), MT (modus tollens), IMP ($\sim A \vee B$ from $A \rightarrow B$), LDS (B from A and $\sim A \vee B$), RDS (B from A and $B \vee \sim A$), CP (conditional proof), SIMplication (A or B from $A \wedge B$), CASES (or dilemma).

The rules for quantifiers:

US (universal specialization), UG (universal generalization), EG (existential quantifier), EE (eliminate existential quantifier), SUB (substitute a term t for an individual variable v).

The wffs of the axioms I.5, I.6, I.7, I.8, and ODO are listed as follows.

The axiom I.5,

$$(\forall x) \sim \text{Undir}(x, x) \quad (16)$$

The axiom I.6

$$(\forall x)(\forall y)[\text{Undir}(x, y) \rightarrow (\forall z)[\text{Undir}(x, z) \vee \text{Undir}(y, z)]] \quad (17)$$

For the axiom I.7, the wffs of W1, W2, W3, and W4 are given as follows.

$$W1 = (\forall x)(\forall y)(\forall z)[\sim \text{Undir}(x, y) \vee \sim \text{Undir}(x, \text{rev}(y)) \vee \text{Undir}(x, z) \vee \text{Undir}(y, z)] \quad (18)$$

$$W2 = (\forall x)(\forall y)(\forall z)[\sim \text{Undir}(x, y) \vee \sim \text{Undir}(x, \text{rev}(y)) \vee \text{Undir}(x, z) \vee \text{Undir}(y, \text{rev}(z))] \quad (19)$$

$$W3 = (\forall x)(\forall y)(\forall z)[\sim \text{Undir}(x, y) \vee \sim \text{Undir}(x, \text{rev}(y)) \vee \text{Undir}(x, \text{rev}(z)) \vee \text{Undir}(y, z)] \quad (20)$$

$$W4 = (\forall x)(\forall y)(\forall z)[\sim \text{Undir}(x, y) \vee \sim \text{Undir}(x, \text{rev}(y)) \vee \text{Undir}(x, \text{rev}(z)) \vee \text{Undir}(y, \text{rev}(z))] \quad (21)$$

The axiom I.8,

$$(\forall x)(\forall y)[\text{Undir}(x, y) \vee \text{Undir}(x, \text{rev}(y))] \quad (22)$$

ODO:

$$(\forall x)(\forall y)(\forall z)[\sim \text{Undir}(x, \text{rev}(y)) \wedge \sim \text{Undir}(x, z) \rightarrow \sim \text{Undir}(y, \text{rev}(z))] \quad (23)$$

Note that only one predicate (i.e. $\text{Undir}(l, m)$) and only one function symbol (i.e. $\text{rev}(l)$) appear in the axioms I.5 to I.8, and ODO. For our automated prover, $\text{Undir}(l, m)$ is written as $\text{Undir } l \ m$, and the function symbol $\text{rev}(l)$ is written as $[\text{rev } l]$. The quantifiers $(\forall x)$ and $(\exists x)$ are written as (Ax) and (Ex) , respectively. The connectives \rightarrow , \vee , and \wedge are written as $- >$, $|$, and $\&$, respectively. “ \sim ” stands for “ \sim ” (i.e. “not”).

4 Replacing the axiom I.6 with ODO

It is also interesting to replace the axiom I.6 with ODO.

Theorem 2. Let the axiomatization 2 be obtained from von Plato’s axiomatization by replacing axiom I.6 with ODO. Then, the axiomatization 2 is equivalent to von Plato’s axiomatization.

Proof. It is known that ODO can be derived from von Plato’s axiomatization. Thing left to do is to derive the axiom I.6 from the axiomatization 2. Our theorem proving ANDP finds a natural deduction of the axiom I.6 from the axioms I.7, I.8, and ODO. Ref. Appendix E.

5 Appendix A. The axiom I.6 implies W1

Solution

1. $(Ax)(Ay)[\text{UNDIR } x y \rightarrow (Az)[\text{UNDIR } x z \mid \text{UNDIR } y z]]$	ASSUMED-PREMISE
