

ON HOMOGENEITY OF  $\mathbb{N}^\tau$ 

A. KARASSEV, E. SHCHEPIN, AND V. VALOV

ABSTRACT. It is shown that any homeomorphism between two compact subsets of  $\mathbb{N}^\tau$  can be extended to an autohomeomorphism of  $\mathbb{N}^\tau$ .

## 1. INTRODUCTION

J. Pollard [4] established the following theorem: *Let  $X$  and  $Y$  be complete, nowhere locally compact, zero-dimensional separable metric spaces, and let  $P$  and  $K$  be closed nowhere dense subsets of  $X$  and  $Y$ , respectively. If  $f$  is a homeomorphism between  $P$  and  $K$ , then there exists a homeomorphism between  $X$  and  $Y$  extending  $f$ .*

Pollard's result is not anymore true for uncountable powers of the irrationals. For example, if  $P$  and  $K$  are two homeomorphic closed nowhere dense subsets of  $\mathbb{N}^{\aleph_1}$  such that only one of them is  $G_\delta$ , then no homeomorphism between  $P$  and  $K$  admits an extension to an autohomeomorphism on  $\mathbb{N}^{\aleph_1}$ . But a non-metrizable analogue of Pollard's theorem remains valid for compact subsets of  $\mathbb{N}^\tau$ . The technique developed in recent papers [5] and [6] allows to prove the following theorem, where  $\pi_1 : Y \times \mathbb{N}^\tau \rightarrow Y$  is the projection (by a 0-dimensional space we mean a Tychonoff space having a compactification of covering dimension 0).

**Theorem 1.1.** *Let  $Y$  be a 0-dimensional Tychonoff space and  $P$  and  $K$  be compact subsets of  $Y \times \mathbb{N}^\tau$  with  $\tau \geq \aleph_0$ . Then every homeomorphism  $f : P \rightarrow K$  with  $\pi_1 \circ f = \pi_1|_P$  can be extended to a homeomorphism  $\tilde{f} : Y \times \mathbb{N}^\tau \rightarrow Y \times \mathbb{N}^\tau$  such that  $\pi_1 \circ \tilde{f} = \pi_1$ .*

Theorem 1.1 implies a non-metrizable analogue of mentioned above Pollard's result [4].

**Corollary 1.2.** *Let  $P$  and  $K$  be compact subsets of  $\mathbb{N}^\tau$  with  $\tau \geq \aleph_0$ . Then every homeomorphism between  $P$  and  $K$  can be extended to a homeomorphism of  $\mathbb{N}^\tau$ .*

## 2. PROOF OF THEOREM 1.1

For any space  $X$  let  $\mathcal{H}(X)$  denote the set of all autohomeomorphisms of  $X$ . If  $d$  be a bounded complete metric on  $\mathbb{N}^{\aleph_0}$  we equip  $\mathcal{H}(\mathbb{N}^{\aleph_0})$  with the metric  $\tilde{d} = \hat{d}(f, g) + \hat{d}(f^{-1}, g^{-1})$ , where  $\hat{d}(f, g) = \sup\{d(f(x), g(x)) : x \in \mathbb{N}^{\aleph_0}\}$ . It is well known that  $d$  is a complete metric on  $\mathcal{H}(\mathbb{N}^{\aleph_0})$ .

Next lemma is an analogue of [5, Lemma 3.1].

**Lemma 2.1.** *Let  $X$  be a 0-dimensional space and  $P, K$  be compact subsets of  $X \times \mathbb{N}^{\aleph_0}$ . If  $f : P \rightarrow K$  and  $g \in \mathcal{H}(X)$  are homeomorphisms with  $g \circ \pi_X = \pi_X \circ f$ , then  $f$  can be extended to a homeomorphism  $\tilde{f} \in \mathcal{H}(X \times \mathbb{N}^{\aleph_0})$  such that  $g \circ \pi_X = \pi_X \circ \tilde{f}$ .*

*Proof.* Obviously,  $g(P_X) = K_X$ , where  $P_X = \pi_X(P)$  and  $K_X = \pi_X(K)$ . Denote by  $\pi : X \times \mathbb{N}^{\aleph_0} \rightarrow \mathbb{N}^{\aleph_0}$  the projection. For any  $x \in P_X$  let  $\Phi(x)$  be the set of all  $h \in \mathcal{H}(\mathbb{N}^{\aleph_0})$  such that  $f(x, c) = (g(x), h(c))$  for every  $c \in \pi_X^{-1}(x) \cap P$ . Since  $f|(\pi_X^{-1}(x) \cap P)$  is a homeomorphism between the compact subsets  $\pi(\{\{x\} \times \mathbb{N}^{\aleph_0}\} \cap P)$  and  $\pi(\{\{g(x)\} \times \mathbb{N}^{\aleph_0}\} \cap K)$  of  $\mathbb{N}^{\aleph_0}$ , the Pollard's theorem [4] cited above yields a homeomorphism  $h_x \in \mathcal{H}(\mathbb{N}^{\aleph_0})$  extending  $f|(\pi_X^{-1}(x) \cap P)$ . Hence,  $\Phi(x) \neq \emptyset$  for all  $x \in P_X$ . Moreover, the sets  $\Phi(x)$  are closed in  $\mathcal{H}(\mathbb{N}^{\aleph_0})$  equipped with the metric  $\tilde{d}$ . So, we have a set-valued map  $\Phi : P_X \rightsquigarrow \mathcal{H}(\mathbb{N}^{\aleph_0})$ . One can show that if  $\Phi$  admits a continuous selection  $\phi : P_X \rightarrow \mathcal{H}(\mathbb{N}^{\aleph_0})$ , then the map  $f_1 : P_X \times \mathbb{N}^{\aleph_0} \rightarrow K_X \times \mathbb{N}^{\aleph_0}$ , defined by  $f_1(x, c) = (g(x), \phi(x)(c))$ , is a homeomorphism between  $P_X \times \mathbb{N}^{\aleph_0}$  and  $K_X \times \mathbb{N}^{\aleph_0}$  extending  $f$  (see [2, Proposition 2.6.11]) with  $\pi_X \circ f_1 = g \circ \pi_X$ . On the other hand, since  $X$  is 0-dimensional and  $P_X$  is a compact subset of  $X$ , the map  $\phi$  has a continuous extension  $\tilde{\phi} : X \rightarrow \mathcal{H}(\mathbb{N}^{\aleph_0})$ . This is true because  $\mathcal{H}(\mathbb{N}^{\aleph_0})$  is a metric space. Indeed, then  $\phi(P_X)$  is a compact subset of  $\mathcal{H}(\mathbb{N}^{\aleph_0})$ , hence  $\phi(P_X)$  is itself a compact metric space. So, it is an absolute extensor for 0-dimensional spaces in the sense of Chigogidze [1], and we can extend  $\phi$  to a map  $\tilde{\phi} : X \rightarrow \mathcal{H}(\mathbb{N}^{\aleph_0})$ . Next, let  $\tilde{f} : X \times \mathbb{N}^{\aleph_0} \rightarrow X \times \mathbb{N}^{\aleph_0}$  be the map defined by  $\tilde{f}(x, c) = (g(x), \tilde{\phi}(x)(c))$ . Then  $\tilde{f}$  is a homeomorphism extending  $f$ . Therefore, according to Michael's [3] zero-dimensional selection theorem, it suffices to show that  $\Phi$  is lower semi-continuous.

To prove that, let  $x^* \in P_X$  be a fixed point and  $h^* \in \Phi(x^*) \cap W$ , where  $W$  is open in  $\mathcal{H}(\mathbb{N}^{\aleph_0})$ . We can assume that  $W$  is of the form  $\{h \in \mathcal{H}(\mathbb{N}^{\aleph_0}) : \{x^*\} \times h(U_i) = \{g(x^*)\} \times V_i, i = 1, 2, \dots\}$ , where  $\{U_i\}_{i=1}^\infty$  and  $\{V_i\}_{i=1}^\infty$  are clopen disjoint countable covers of  $\mathbb{N}^{\aleph_0}$ . Because  $P(x^*) =$

$(\{x^*\} \times \mathbb{N}^{\mathbb{N}^0}) \cap P$  and  $K(g(x^*)) = (\{g(x^*)\} \times \mathbb{N}^{\mathbb{N}^0}) \cap K$  are compact, there is  $k$  such that  $(\{x^*\} \times U_i) \cap P(x^*) \neq \emptyset$  and  $(\{g(x^*)\} \times V_i) \cap K(g(x^*)) \neq \emptyset$  if and only if  $i \leq k$ .

We extend each of the sets  $\{x^*\} \times U_i$  and  $\{g(x^*)\} \times V_i$ ,  $i \leq k$ , to clopen sets  $\tilde{U}_i \subset P_X \times \mathbb{N}^{\mathbb{N}^0}$  and  $\tilde{V}_i \subset K_X \times \mathbb{N}^{\mathbb{N}^0}$  such that

- (1)  $\tilde{U}_i = O(x^*) \times U_i$  and  $\tilde{V}_i = g(O(x^*)) \times V_i$ , where  $O(x^*)$  is a clopen neighborhood of  $x^*$  in  $P_X$  such that  $P(x) \subset \bigcup_{i=1}^k \tilde{U}_i$  for all  $x \in O(x^*)$ ;
- (2)  $O(x^*)$  is so small that  $f(\tilde{U}_i \cap P) \subset \tilde{V}_i \cap K$ .

We are going to show that for every  $x \in O(x^*)$  there exists  $h_x \in \Phi(x) \cap W$ . We fix such  $x$  and observe that all sets  $\tilde{U}_i(x) = \tilde{U}_i \cap (\{x\} \times \mathbb{N}^{\mathbb{N}^0})$  and  $\tilde{V}_i(x) = \tilde{V}_i \cap (\{g(x)\} \times \mathbb{N}^{\mathbb{N}^0})$  are nowhere locally compact and complete. Moreover,  $\tilde{U}_i(x) \cap P$  and  $\tilde{V}_i(x) \cap K$  are compact sets in  $\tilde{U}_i(x)$  and  $\tilde{V}_i(x)$ , respectively, and  $f_i^x = f|(\tilde{U}_i(x) \cap P)$  is a homeomorphism between them for every  $i \leq k$ . Hence, by Pollard's theorem [4], there exist homeomorphisms  $\tilde{f}_i^x : \tilde{U}_i(x) \rightarrow \tilde{V}_i(x)$  extending  $f_i^x$ ,  $i \leq k$ . For every  $(x, c) \notin \bigcup_{i=1}^k \tilde{U}_i(x)$  there is exactly one  $i > k$  with  $c \in U_i$ , and we define  $\tilde{f}_i^x(x, c) = h^*(x^*, c)$ . The homeomorphisms  $\tilde{f}_i^x$ ,  $i = 1, 2, \dots$ , provide a homeomorphism  $h'_x$  between  $\pi_X^{-1}(x)$  and  $\pi_X^{-1}(g(x))$  extending  $f|(\pi_X^{-1}(x) \cap P)$ . Then the equality  $h_x(c) = h'_x(x, c)$ ,  $c \in \mathbb{N}^{\mathbb{N}^0}$ , defines a homeomorphism from  $\mathcal{H}(\mathbb{N}^{\mathbb{N}^0})$  with  $h_x \in \Phi(x) \cap W$ . Therefore,  $\Phi$  is lower semi-continuous.  $\square$

Everywhere below we suppose that  $P, K$  are compact subsets of  $Y \times \mathbb{N}^A$  and  $f : P \rightarrow K$  is a homeomorphism such that  $\pi_1|P = \pi_1 \circ f$ , where  $Y$  is a 0-dimensional space. A set  $B \subset A$  is called *f-admissible* if there exists a homeomorphism  $f_B : P_B \rightarrow K_B$  such that  $(f_B \circ p_B)|P = p_B \circ f$  and  ${}_B\pi_1|P_B = {}_B\pi_1 \circ f_B$ , where  $\pi_B : \mathbb{N}^A \rightarrow \mathbb{N}^B$ ,  $p_B : Y \times \mathbb{N}^A \rightarrow Y \times \mathbb{N}^B$ , and  ${}_B\pi_1 : Y \times \mathbb{N}^B \rightarrow Y$  denote the projections,  $P_B = p_B(P)$  and  $K_B = p_B(K)$ .

**Lemma 2.2.** *If  $A$  is an uncountable set, then for every  $\alpha \in A$  there is an f-admissible countable set  $B(\alpha) \subset A$  containing  $\alpha$*

*Proof.* Since  $\pi_1|P = \pi_1 \circ f$ ,  $f(y, x) = (y, h_1(y, x))$  for all  $(y, x) \in P$ , where  $h_1 : P \rightarrow \mathbb{N}^A$ . Similarly,  $f^{-1}(y, x) = (y, h_2(y, x))$  for all  $(y, x) \in K$  with  $h_2 : K \rightarrow \mathbb{N}^A$ .

*Claim 2.3.* For every  $i = 1, 2$  and a countable set  $C \subset A$ , there is countable  $D(i) \subset A$  containing  $C$  and a continuous maps  $g_1 : P_{D(1)} \rightarrow \mathbb{N}^C$ ,  $g_2 : K_{D(2)} \rightarrow \mathbb{N}^C$  with  $(g_1 \circ p_{D(1)})|P = \pi_C \circ h_1$  and  $(g_2 \circ p_{D(2)})|K = \pi_C \circ h_2$ .

Let  $\mathcal{B}$  be a countable base for  $\mathbb{N}^C$ . Then  $G_U = h_1^{-1}(\pi_C^{-1}(U))$  is a  $\sigma$ -compact open subset of  $P$  for every  $U \in \mathcal{B}$ . So, there is a sequence  $\{W_U(n)\}_{n \geq 1}$  of standard open sets in  $Y \times \mathbb{N}^A$  such that  $G_U$  is the union of all  $W_U(n) \cap P$ ,  $n \geq 1$ . Therefore, for every  $U$  there exists a countable set  $C_U \subset A$  with  $p_{C_U}^{-1}(p_{C_U}(W_U(n))) = W_U(n)$ ,  $n \geq 1$ . We can assume that each  $C_U$  contains  $C$ . Then  $D(1) = \bigcup_{U \in \mathcal{B}} C_U$  is a countable set containing  $C$  and  $p_{D(1)}(y, x) = p_{D(1)}(y', x')$  implies  $\pi_C(h_1(y, x)) = \pi_C(h_1(y', x'))$ , where  $(y, x), (y', x') \in P$ . Because  $P_{D(1)}$  is compact, this yields the existence of a map  $g_1 : P_{D(1)} \rightarrow \mathbb{N}^C$  with  $(g_1 \circ p_{D(1)})|P = \pi_C \circ h_1$ . Similarly, we can find a countable set  $D(2) \subset A$  which contains  $C$  and a map  $g_2 : K_{D(2)} \rightarrow \mathbb{N}^C$  satisfying the claim.

Using Claim 2.3, we construct by induction an increasing sequence  $\{B(n)\}_{n \geq 0}$  of countable sets  $B(n) \subset A$  and maps  $\varphi_n : P_{B(n+1)} \rightarrow \mathbb{N}^{B(n)}$  for  $n = 2k$  and  $\psi_n : K_{B(n+1)} \rightarrow \mathbb{N}^{B(n)}$  for  $n = 2k + 1$  such that

- $B(0) = \{\alpha\}$ ;
- $\pi_{B(n)} \circ h_1 = (\varphi_n \circ p_{B(n+1)})|P$  if  $n = 2k$ ;
- $\pi_{B(n)} \circ h_2 = (\psi_n \circ p_{B(n+1)})|K$  if  $n = 2k + 1$ .

Let  $B(\alpha) = \bigcup_{n=0}^{\infty} B(n)$ . Then we have maps  $\varphi_{B(\alpha)} : P_{B(\alpha)} \rightarrow \mathbb{N}^{B(\alpha)}$  and  $\psi_{B(\alpha)} : K_{B(\alpha)} \rightarrow \mathbb{N}^{B(\alpha)}$  such that  $\pi_{B(\alpha)} \circ h_1 = (\varphi_{B(\alpha)} \circ p_{B(\alpha)})|P$  and  $\pi_{B(\alpha)} \circ h_2 = (\psi_{B(\alpha)} \circ p_{B(\alpha)})|K$ . Observe that  $P_{B(\alpha)}$  and  $K_{B(\alpha)}$  are subsets of  $Y \times \mathbb{N}^{B(\alpha)}$ . Then  $f_{B(\alpha)} : P_{B(\alpha)} \rightarrow Y \times \mathbb{N}^{B(\alpha)}$ , defined by  $f_{B(\alpha)}(y, x) = (y, \varphi_{B(\alpha)}(y, x))$  for every  $(y, x) \in P_{B(\alpha)}$ , is a homeomorphism between  $P_{B(\alpha)}$  and  $K_{B(\alpha)}$  whose inverse is the map  $g_{B(\alpha)} : K_{B(\alpha)} \rightarrow Y \times \mathbb{N}^{B(\alpha)}$ , defined by  $g_{B(\alpha)}(y, x) = (y, \psi_{B(\alpha)}(y, x))$  for  $(y, x) \in K_{B(\alpha)}$ . Therefore,  $B(\alpha)$  is  $f$ -admissible.  $\square$

*Proof of Theorem 1.1.* We identify  $\mathbb{N}^\tau$  with  $\mathbb{N}^A$ , where  $A$  is a set of cardinality  $\tau$ . The case  $\tau = \aleph_0$  follows from Lemma 2.1. So, let  $A = \{\alpha : \alpha < \omega(\tau)\}$  be uncountable. By Lemma 2.2, we can cover  $A$  by a family  $\{B(\alpha) : \alpha < \omega(\tau)\}$  of countable  $f$ -admissible sets. Since any union of  $f$ -admissible sets is also  $f$ -admissible, from the family  $\{B(\alpha) : \alpha < \omega(\tau)\}$  we obtain an increasing family of  $f$ -admissible sets  $A(\alpha)$  and homeomorphisms  $f_{A(\alpha)} : P_{A(\alpha)} \rightarrow K_{A(\alpha)}$  such that:

- (3)  $A(1)$  is countable, and the cardinality of each  $A(\alpha)$  is less than  $\tau$ ;
- (4)  $A(\alpha) = \bigcup_{\beta < \alpha} A(\beta)$  if  $\alpha$  is a limit ordinal;
- (5)  $A(\alpha + 1) \setminus A(\alpha)$  is countable but infinite for all  $\alpha$ ;
- (6)  $p_{A(\alpha)} \circ f = (f_{A(\alpha)} \circ p_{A(\alpha)})|P$ .

We need to prove that each  $f_{A(\alpha)}$  can be extended to a homeomorphism  $\tilde{f}_{A(\alpha)} : Y \times \mathbb{N}^{A(\alpha)} \rightarrow Y \times \mathbb{N}^{A(\alpha)}$  such that

- (7)  $p_{A(\alpha)}^{A(\alpha+1)} \circ \tilde{f}_{A(\alpha+1)} = (\tilde{f}_{A(\alpha)} \circ p_{A(\alpha)}^{A(\alpha+1)})$ ;  
 (8)  ${}_\alpha\pi_1 = {}_\alpha\pi_1 \circ \tilde{f}_{A(\alpha)}$ , where  ${}_\alpha\pi_1 : Y \times \mathbb{N}^{A(\alpha)} \rightarrow Y$  denotes the projection.

The proof is by transfinite induction. The first extension  $\tilde{f}_{A(1)}$  exists by Lemma 2.1 because  $P_{A(1)}$  and  $K_{A(1)}$  are compact subsets of  $Y \times \mathbb{N}^{A(1)}$  and  ${}_1\pi_1|P_{A(1)} = {}_1\pi_1 \circ f_{A(1)}$ . If  $\beta$  is a limit ordinal and  $\tilde{f}_{A(\alpha)}$  is already defined for all  $\alpha < \beta$ , then item (4) implies the existence of  $\tilde{f}_{A(\beta)}$ . Therefore, we need only to define  $\tilde{f}_{A(\alpha+1)}$  provided  $\tilde{f}_{A(\alpha)}$  exists.

To this end, we apply again Lemma 2.1 for the space  $Y \times \mathbb{N}^{A(\alpha+1)} = Y \times \mathbb{N}^{A(\alpha)} \times \mathbb{N}^{A(\alpha+1) \setminus A(\alpha)}$ , the sets  $P_{A(\alpha+1)}, K_{A(\alpha+1)}$ , the projection  $\pi : Y \times \mathbb{N}^{A(\alpha)} \times \mathbb{N}^{A(\alpha+1) \setminus A(\alpha)} \rightarrow Y \times \mathbb{N}^{A(\alpha)}$ , and the homeomorphisms  $f_{A(\alpha+1)}$  and  $\tilde{f}_{A(\alpha)}$ . Moreover,  $Y \times \mathbb{N}^{A(\alpha)}$  has a 0-dimensional compactification because both  $Y$  and  $\mathbb{N}^{A(\alpha)}$  have such compactifications. Hence, there is a homeomorphism  $\tilde{f}_{A(\alpha+1)} \in \mathcal{H}(Y \times \mathbb{N}^{A(\alpha+1)})$  extending  $f_{A(\alpha+1)}$  and satisfying condition (7). Since  ${}_\alpha\pi_1 = {}_\alpha\pi_1 \circ \tilde{f}_{A(\alpha)}$ , we also have  ${}_{\alpha+1}\pi_1 = {}_{\alpha+1}\pi_1 \circ \tilde{f}_{A(\alpha+1)}$ .  $\square$

*Proof of Corollary 1.2.* The corollary is obtained from Theorem 1.1 by letting  $Y$  to be the one-point space.  $\square$
