

# ON AN INHOMOGENEOUS EXTERIOR ROBIN PROBLEMS WITH CRITICAL NONLINEARITIES

MEIRKHAH B. BORIKHANOV AND BERIKBOL T. TOREBEK

ABSTRACT. The paper studies the large-time behavior of solutions to the Robin problem for PDEs with critical nonlinearities. For the considered problems, nonexistence results are obtained, which complements the interesting recent results by Ikeda et al. [J. Differential Equations, 269 (2020), no. 1, 563-594], where critical cases were left open. Moreover, our results provide partially answers to some other open questions previously posed by Zhang [Proc. Roy. Soc. Edinburgh Sect. A, 131 (2001), no. 2, 451-475] and Jleli-Samet [Nonlinear Anal., 178 (2019), 348-365].

The proof of main results is based on methods of nonlinear capacity estimates specifically adapted to the nature of the exterior domain. Furthermore, the difference in our approach lies in the fact that we are considering a class of test functions with logarithmic arguments.

## 1. INTRODUCTION

Recently, Ikeda et al. in [7] have studied the exterior inhomogeneous Robin problems for the following semilinear PDEs:

- elliptic equation

$$\begin{cases} -\Delta u = u^p, & x \in \Omega^c, \\ \frac{\partial u}{\partial \nu} + \alpha u = f(x), & x \in \partial\Omega, \end{cases} \quad (1.1)$$

- heat equation

$$\begin{cases} u_t - \Delta u = |u|^p, & (t, x) \in (0, \infty) \times \Omega^c, \\ \frac{\partial u}{\partial \nu} + \alpha u = f(x), & (t, x) \in (0, \infty) \times \partial\Omega, \\ u(0, x) = u_0(x), & x \in \Omega^c, \end{cases} \quad (1.2)$$

*Key words and phrases.* exterior Robin problem, critical exponent, nonexistence, global solution.

- wave equation

$$\begin{cases} u_{tt} - \Delta u = |u|^p, & (t, x) \in (0, \infty) \times \Omega^c, \\ \frac{\partial u}{\partial \nu} + \alpha u = f(x), & (t, x) \in (0, \infty) \times \partial\Omega, \\ u(0, x) = u_0(x), \quad u_t(0, x) = u_1(x), & x \in \Omega^c, \end{cases} \quad (1.3)$$

- damped wave equation

$$\begin{cases} u_{tt} - \Delta u + u_t = |u|^p, & (t, x) \in (0, \infty) \times \Omega^c, \\ \frac{\partial u}{\partial \nu} + \alpha u = f(x), & (t, x) \in (0, \infty) \times \partial\Omega, \\ u(0, x) = u_0(x), \quad u_t(0, x) = u_1(x), & x \in \Omega^c, \end{cases} \quad (1.4)$$

where  $\Omega = B(0, 1)$  is the unit open ball in  $\mathbb{R}^N$ ,  $N \geq 3$ ,  $\Omega^c = \mathbb{R}^N \setminus \Omega$ ,  $\alpha > 0$ ,  $p \in (1, \infty)$ ,  $f \in L^1(\partial\Omega)$ ,  $f \not\equiv 0$  and  $u_0, u_1 \in L^1_{loc}(\overline{\Omega^c})$ . In addition,  $\nu$  is the outward unit normal on  $\partial\Omega$ .

They showed that:

Suppose that  $u_i \in L^1_{loc}(\Omega^c)$ ,  $u_i \geq 0$ ,  $i = 0, 1$ , and  $f \in L^1(\partial\Omega)$ .

- (a): If  $1 < p < \frac{N}{N-2}$ ,  $N \geq 2$  and  $\int_{\partial\Omega} f(x) d\sigma > 0$ , then problems (1.2), (1.3) and (1.4) admits no global solutions. In particular, problem (1.1) has no positive solution.
- (b): If  $p > \frac{N}{N-2}$ ,  $N \geq 3$ , the problems (1.2), (1.3) and (1.4) has positive global solutions for some  $f > 0$ . In particular, problem (1.1) has positive solution for some  $f > 0$ .

They also studied the dependence of the critical exponent on the initial data and obtained the following results:

Suppose that  $u_i \in L^1_{loc}(\Omega^c)$ ,  $u_i \geq 0$ ,  $i = 0, 1$ , and  $f \in L^1(\partial\Omega)$ ,  $f \geq 0$ . Let  $u_0$  satisfies

$$u_0(x) \geq A|x|^\lambda, \quad A > 0, \quad 2 - N < \lambda < 0. \quad (1.5)$$

- (a\*): If  $1 < p < 1 - \frac{2}{\lambda}$ , then problems (1.2), (1.3) and (1.4) possess no global weak solutions.
- (b\*): If  $p > 1 - \frac{2}{\lambda}$ , then problems (1.2), (1.3) and (1.4) have global positive solutions for some  $f > 0$ .

It should be noted that in the above results the critical cases  $p = \frac{N}{N-2}$ , and  $p = 1 - \frac{2}{\lambda}$  were not investigated and the large-time behavior of the solution in the critical cases is still **open**. The main purpose of our paper is to attempt to answer this question and fill the gap in the results of Ikeda et al. from [7].

For the convenience of readers, below we will provide more detailed historical facts about the above problems and about critical exponents.

When  $\Omega$  is empty, Fujita (see [6]) showed that the critical exponent of the parabolic problem (1.2) is  $1 + \frac{2}{N}$ , i.e.:

- (i) If  $1 < p < 1 + \frac{2}{N}$  and  $u_0 \geq 0$ , then problem (1.2) has no global positive solutions;
- (ii) If  $p > 1 + \frac{2}{N}$  and  $u_0$  is smaller than a small Gaussian, then (1.2) has global positive solutions.

The number  $1 + \frac{2}{N}$  is called the Fujita critical exponent. When  $\Omega$  is bounded non-empty domain, Bandle and Levine [1] showed that the critical exponent of semilinear heat equation with homogeneous exterior Dirichlet conditions is still  $1 + \frac{2}{N}$ . Also, in [16, 19] it was shown that the number  $1 + \frac{2}{N}$  is still a critical exponent for the semilinear heat equation with homogeneous exterior Neumann and with homogeneous exterior Robin conditions. The number  $1 + \frac{2}{N}$  is also a critical exponent for the exterior damping wave problems (see [4, 5, 8, 9, 17]).

In [2] Bandle et al. studied the parabolic problem (1.2) subject to the inhomogeneous Dirichlet and Neumann boundary conditions. Namely, it was shown that

- (i) If  $1 < p \leq \frac{N}{N-2}$ ,  $N \geq 2$  and  $\int_{\partial\Omega} f(x) d\sigma > 0$ , then (1.2) has no global solutions for  $\alpha = 0$  or  $\alpha = \infty$ .
- (ii) If  $p > \frac{N}{N-2}$ ,  $N \geq 3$ , then problem (1.2) for  $\alpha = 0$  or  $\alpha = \infty$ , has global solutions for some  $f > 0$  and  $u_0 > 0$ .

In [21] Zhang generalized these results considering weighted nonlinearity  $|x|^m|u|^p$ ,  $m > -2$  instead of the nonlinear term  $|u|^p$  and showed that  $\frac{N+m}{N-2}$  is a critical exponent. In addition, he also studied semilinear elliptic equation (with nonlinearity  $|x|^m|u|^p$ ,  $m > -2$ ) with exterior Dirichlet or exterior Neumann non-zero boundary conditions and semilinear wave equations (with nonlinearity  $|x|^m|u|^p$ ,  $m > -2$ ) with exterior Neumann inhomogeneous boundary conditions. It is shown that  $\frac{N+m}{N-2}$  is still a critical exponent of these problems. However, critical cases of these problems corresponding to the Neumann boundary conditions were not studied and remained open.

It is worth noting that several extensions of the above results to more general types of parabolic and hyperbolic equations with exterior Dirichlet or Neumann boundary conditions have been studied in a number of papers (for example, see [11, 12, 14, 15, 18, 20, 22, 23]).

Recently, Jleli and Samet [13] obtained a number of interesting results for the heat and wave (with and without damping) equations with inhomogeneous Dirichlet conditions on exterior domains. That is, they showed that the critical exponent of the studied problems is  $\frac{N}{N-2}$ , they also proved that in the two-dimensional case, the studied problems do not have global positive solutions for all  $p > 1$ . However, the critical cases  $p = \frac{N}{N-2}$  of the studied problems have also not been studied and remain open [13, Remark 1.7].

## 2. MAIN RESULTS

In this section, we derive the main results of the present paper.

Before presenting our main results, let us mention in which sense the solutions are considered.

Let  $Q := (0, \infty) \times \Omega^c$  and  $\Gamma := (0, \infty) \times \partial\Omega$ , here we have to note that  $\Omega^c$  is closed and  $\Gamma \subset \Omega^c$ .

**Definition 2.1** (Weak solution). Let  $f \in L^1(\partial\Omega)$ . We say that  $u \in L^p_{\text{loc}}(\overline{\Omega^c})$  is a positive weak solution to (1.1), if

$$\int_{\Omega^c} |u|^p \varphi_2 dx + \int_{\Gamma} f \varphi_2 d\sigma = - \int_{\Omega^c} u \Delta \varphi_2 dx, \quad (2.1)$$

holds for all  $\varphi_2 \in C^2(\overline{\Omega^c})$ ,  $\varphi_2 \geq 0$  such that

- (i):  $\varphi_2(x) \equiv 0$ ,  $|x| \geq R$  here  $R > 1$ ;
- (ii):  $\frac{\partial}{\partial \nu} \varphi_2(x) + \alpha \varphi_2(x) = 0$ ,  $x \in \partial\Omega$ ;
- (iii):  $\Delta \varphi_2 \in C(\overline{\Omega^c})$

and the notation  $d\sigma$  is the surface measure on  $\partial\Omega$ .

**Definition 2.2** (Global weak solution). Let  $u_0 \in L^1_{\text{loc}}(\overline{\Omega^c})$  and  $f \in L^1(\partial\Omega)$ . We say that  $u \in L^p_{\text{loc}}([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.2), if

$$\int_Q |u|^p \varphi dx dt + \int_{\Omega^c} u_0(x) \varphi(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt = - \int_Q u \varphi_t dx dt - \int_Q u \Delta \varphi dx dt, \quad (2.2)$$

holds for all  $\varphi \in C^{1,2}_{t,x}([0, \infty) \times \Omega^c) \cap ([0, \infty) \times \overline{\Omega^c})$ ,  $\varphi \geq 0$  such that

- (i):  $\varphi(t, \cdot) \equiv 0$ ,  $t \geq T$  here  $T > 0$ ;
- (ii):  $\varphi(\cdot, x) \equiv 0$ ,  $|x| \geq R$  here  $R > 1$ ;
- (iii):  $\frac{\partial}{\partial \nu} \varphi(x) + \alpha \varphi(x) = 0$ ,  $x \in \Gamma$ ;
- (iv):  $\varphi_t, \Delta \varphi \in C([0, \infty) \times \overline{\Omega^c})$ .

**Definition 2.3** (Global weak solution). Let  $u_0, u_1 \in L^1_{\text{loc}}(\overline{\Omega^c})$  and  $f \in L^1(\partial\Omega)$ . We say that  $u \in L^p_{\text{loc}}([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.3), if

$$\begin{aligned} \int_Q |u|^p \varphi dx dt + \int_{\Omega^c} u_1(x) \varphi(0, x) dx - \int_{\Omega^c} u_0(x) \varphi_t(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt \\ = - \int_Q u \varphi_{tt} dx dt - \int_Q u \Delta \varphi dx dt, \end{aligned} \quad (2.3)$$

holds for all  $\varphi \in C^{2,2}_{t,x}([0, \infty) \times \Omega^c) \cap ([0, \infty) \times \overline{\Omega^c})$ ,  $\varphi \geq 0$  such that

- (i):  $\varphi(t, \cdot) \equiv 0$ ,  $t \geq T$  here  $T > 0$ ;
- (ii):  $\varphi(\cdot, x) \equiv 0$ ,  $|x| \geq R$  here  $R > 1$ ;
- (iii):  $\frac{\partial}{\partial \nu} \varphi(t, x) + \alpha \varphi(t, x) = 0$ ,  $(t, x) \in \Gamma$ ;
- (iv):  $\varphi_{tt}, \Delta \varphi \in C([0, \infty) \times \overline{\Omega^c})$ ,  $\varphi_t(0, \cdot) \in (\overline{\Omega^c})$ .

**Definition 2.4** (Global weak solution). Let  $u_0, u_1 \in L^1_{loc}(\overline{\Omega^c})$  and  $f \in L^1(\partial\Omega)$ . We say that  $u \in L^p_{loc}([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.4), if

$$\begin{aligned} \int_Q |u|^p \varphi dx dt + \int_{\Omega^c} (u_0(x) + u_1(x)) \varphi(0, x) dx - \int_{\Omega^c} u_0(x) \varphi_t(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt \\ = \int_Q u \varphi_{tt} dx dt - \int_Q u \varphi_t dx dt - \int_Q u \Delta \varphi dx dt, \end{aligned} \quad (2.4)$$

holds for all  $\varphi \in C^{2,2}_{t,x}([0, \infty) \times \Omega^c) \cap ([0, \infty) \times \overline{\Omega^c})$ ,  $\varphi \geq 0$  such that

- (i):  $\varphi(t, \cdot) \equiv 0$ ,  $t \geq T$  here  $T > 0$ ;
- (ii):  $\varphi(\cdot, x) \equiv 0$ ,  $|x| \geq R$  here  $R > 1$ ;
- (iii):  $\frac{\partial}{\partial \nu} \varphi(t, x) + \alpha \varphi(t, x) = 0$ ,  $(t, x) \in \Gamma$ ;
- (iv):  $\varphi_t, \varphi_{tt}, \Delta \varphi \in C([0, \infty) \times \overline{\Omega^c})$ .

**Theorem 2.5.** Suppose that  $u_0, u_1 \in L^1_{loc}(\overline{\Omega^c})$ ,  $N \geq 3$  and  $f \in L^1(\partial\Omega)$ . If

$$\int_{\partial\Omega} f(x) d\sigma > 0 \quad \text{and} \quad p = \frac{N}{N-2},$$

then we have the following properties:

- (i) The problem (1.1) does not admit positive weak solutions.
- (ii) The problem (1.2) possesses no global in time weak solutions.
- (iii) The problem (1.3) does not admit global in time weak solutions.
- (iv) The problem (1.4) does not admit global in time weak solutions.

*Remark 2.6.* The following conclusions can be drawn from the above results:

- (a) Theorem 2.5 completes the Theorems 1.2-1.4 from [7], where the critical cases  $p = \frac{N}{N-2}$  of problems (1.1)-(1.4) has not been studied. Also, in case  $\alpha \rightarrow \infty$ , the results of Theorem 2.5 provide answers to open questions posed in [13, Remark 1.7] and in [21, Remark 1.6].
- (b) It is worth noting that in Theorem 2.5 we did not assume that the initial data were positive. Therefore, when  $\alpha \rightarrow 0$ , part (ii) of Theorem 2.5 partially improves results of Zhang from [21, part (a) of Theorem 1.3], where similar results were obtained for positive initial data.

**Theorem 2.7.** Suppose that  $u_0, u_1 \in L^1_{loc}(\overline{\Omega^c})$ ,  $u_0 \geq 0$ ,  $N \geq 3$ , and  $f \in L^1(\partial\Omega)$ ,  $f \geq 0$ . We also assume that  $u_0$  satisfies (1.5) and let  $\lambda$  satisfies

$$\begin{cases} 2 - N < \lambda < 0, & \text{if } N = 3, 4, \\ 2 - N < \lambda < 4 - N, & \text{if } N \geq 5. \end{cases}$$

If

$$1 < p = 1 - \frac{2}{\lambda},$$

then:

- (i) The problem (1.2) does not admit global in time weak solutions.
- (ii) The problem (1.3) possesses no global in time weak solutions.
- (iii) The problem (1.4) does not admit global in time weak solutions.

*Remark 2.8.* We present below some arguments related to the result of Theorem 2.7.

- (a) Results of Theorem 2.7 completes Theorem 1.6 from [7], where the critical case  $p = 1 - \frac{2}{\lambda}$  was left open. In addition, we do not assume the positiveness of the initial function  $u_1$ , it can be a sign-changing function.

- (b) It is easy to see that the function  $f(x)$  does not affect the result of Theorem 2.7. Therefore,  $1 - \frac{2}{\lambda}$ ,  $2 - N < \lambda < 0$ , remains a critical exponent of the above problems with homogeneous Robin conditions.
- (c) It is obvious that

$$\frac{N}{N-2} < 1 - \frac{2}{\lambda},$$

for  $2 - N < \lambda < 0$ . This means that if  $u_0$  satisfies (1.5), then the critical exponent will be expanded, hence the set of solutions for which the studied problems are globally unsolvable also will expand.

- (d) In Theorem 2.7, we have imposed the restriction from above on  $\lambda$  for  $N \geq 5$ . The method that we use for the proof is not able to remove this restriction. Therefore, we do not know what will happen if

$$1 < p = 1 - \frac{2}{\lambda}, \quad 4 - N \leq \lambda < 0, \quad N \geq 5.$$

This question remains open.

The proof of main results is based on methods of nonlinear capacity estimates specifically adapted to the nature of the exterior ball. Furthermore, the difference in our approach lies in the fact that we are considering a class of test functions with logarithmic arguments. This approach was previously successfully applied to the study of critical cases of the semilinear wave equation on the noncompact complete Riemannian manifold in [10] and the semilinear pseudo-parabolic equations on  $\mathbb{R}^N$  in [3].

### 3. TEST FUNCTIONS AND USEFUL ESTIMATES

This section will cover some properties of test functions. Additionally, we will establish some useful estimates related to the test functions.

We consider the function in the following form

$$\varphi(t, x) = \varphi_1(t)\varphi_2(x), \quad (t, x) \in Q, \quad (3.1)$$

for sufficiently large  $T, R$

$$\varphi_1(t) = \left(1 - \frac{t}{T}\right)^l, \quad t > 0, \quad l > \frac{2p}{p-1} \quad (3.2)$$

and

$$\varphi_2(x) = H(x)\xi(x) = H(x)\Psi^k \left( \frac{\ln \left( \frac{|x|}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right), \quad x \in \Omega^c, \quad k > \frac{2p}{p-1}, \quad (3.3)$$

where  $\Psi : \mathbb{R} \rightarrow [0, 1]$  is a smooth function

$$\Psi(s) = \begin{cases} 1, & \text{if } -1 \leq s \leq 0, \\ \searrow, & \text{if } 0 < s < 1, \\ 0, & \text{if } s \geq 1. \end{cases} \quad (3.4)$$

Furthermore, the harmonic function  $H(x)$  defined in  $\Omega^c$  by

$$H(x) = \frac{N-2+\alpha}{\alpha} - |x|^{2-N}, \quad \text{if } N \geq 3, \quad (3.5)$$

which solves the exterior problem;

$$\begin{cases} -\Delta H = 0 & \text{in } \Omega^c, \\ \frac{\partial}{\partial \nu} H + \alpha H = 0 & \text{on } \partial\Omega. \end{cases} \quad (3.6)$$

**Lemma 3.1.** *For sufficiently large  $T$  and  $R$ , the function  $\varphi(t, x)$  is defined by (3.1) satisfies the following properties*

- (i)  $\varphi(t, \cdot) \equiv 0$ ,  $t \geq T$  here  $T > 0$ ;
- (ii)  $\varphi(\cdot, x) \equiv 0$ ,  $|x| \geq R$  here  $R > 1$ ;
- (iii)  $\frac{\partial}{\partial \nu} \varphi(t, x) + \alpha \varphi(t, x) = 0$ ,  $(t, x) \in \Gamma$ ;

*Proof of Lemma 3.1.* (i) – (ii) follows directly from the properties of  $\varphi_1(t)$  and  $\varphi_2(x)$ , which given by (3.2)-(3.4), respectively.

(iii) In view of (3.1), it implies that

$$\varphi_1(t) \left( \frac{\partial}{\partial \nu} \varphi_2(x) + \alpha \varphi_2(x) \right) = 0.$$

Therefore, for  $1 < |x| < 1 + \varepsilon$ , here  $\varepsilon$  is sufficiently small, we obtain

$$\begin{aligned} \nabla \varphi_2(x) &= \nabla (H(x)\xi(x)) \\ &= H(x)\nabla \xi(x) + \xi(x)\nabla H(x) \\ &= \nabla H(x). \end{aligned}$$

Then, for sufficiently large  $R$  by (3.3) for all  $x \in \partial\Omega$ , we get

$$\frac{\partial}{\partial \nu} \varphi_2(x) = \frac{\partial}{\partial \nu} H(x) = 2 - N.$$

It is easy to verify by direct calculation that

$$\frac{\partial}{\partial \nu} \varphi_2(x) = -\alpha \varphi_2(x),$$

which completes the proof.  $\square$

**Lemma 3.2.** *Let  $N \geq 3$  and  $f \in L^1(\partial\Omega)$ , then*

$$\int_{\Gamma} f \varphi d\sigma dt = C_{N,\alpha,l} T \int_{\partial\Omega} f \xi(x) d\sigma,$$

holds true, where

$$C_{N,\alpha,l} = \frac{N-2}{\alpha(l+1)}.$$

*Proof of Lemma 3.2.* Using properties of the test functions (3.1)-(3.5), we get

$$\begin{aligned} \int_{\Gamma} f \varphi d\sigma dt &= \int_{\Gamma} f \varphi_1(t) \varphi_2(x) d\sigma dt = \left( \int_0^T \left(1 - \frac{t}{T}\right)^l dt \right) \left( \int_{\partial\Omega} f H(x) \xi(x) d\sigma \right) \\ &= \left( \int_0^T \left(1 - \frac{t}{T}\right)^l dt \right) \left( \int_{\partial\Omega} \left( \frac{N-2+\alpha}{\alpha} - 1 \right) f \xi(x) d\sigma \right) \\ &= \left( \frac{N-2}{\alpha(l+1)} \right) T \left( \int_{\partial\Omega} f \xi(x) d\sigma \right), \end{aligned}$$

which gives the desired result.  $\square$

**Lemma 3.3.** *Let  $N \geq 3$  and  $p = \frac{N}{N-2}$ . Then for sufficiently large  $T, R$  we have*

$$\mathcal{I}_1 = \int_Q \varphi^{-\frac{1}{p-1}} |\varphi_t|^{\frac{p}{p-1}} dx dt \leq CT^{1-\frac{N}{2}} R^N, \quad (3.7)$$

$$\mathcal{I}_2 = \int_Q \varphi^{-\frac{1}{p-1}} |\varphi_{tt}|^{\frac{p}{p-1}} dx dt \leq CT^{1-N} R^N \quad (3.8)$$

and

$$\mathcal{I}_3 = \int_Q \varphi^{-\frac{1}{p-1}} |\Delta \varphi|^{\frac{p}{p-1}} dx dt \leq CT \left( (\ln R)^{1-N} + (\ln R)^{1-\frac{N}{2}} \right), \quad (3.9)$$

where  $C$  are positive constants independent of  $T$ .

*Proof of Lemma 3.3.* In view of (3.1) we obtain

$$\mathcal{I}_1 = \left( \int_0^T \varphi_1^{-\frac{1}{p-1}}(t) |\varphi_1'(t)|^{\frac{p}{p-1}} dt \right) \left( \int_{\Omega^c} |\varphi_2(x)| dx \right).$$

Consequently, from (3.2) with  $l > \frac{2p}{p-1}$  it implies that

$$\begin{aligned} \int_0^T \varphi_1^{-\frac{1}{p-1}}(t) |\varphi_1'(t)|^{\frac{p}{p-1}} dt &= \int_0^T \left(1 - \frac{t}{T}\right)^{-\frac{l}{p-1}} \left| lT^{-1} \left(1 - \frac{t}{T}\right)^{l-1} \right|^{\frac{p}{p-1}} dt \\ &= \frac{(p-1)l^{\frac{p}{p-1}}}{l(p-1)-1} T^{1-\frac{p}{p-1}} \\ &= CT^{1-\frac{N}{2}}, \end{aligned} \quad (3.10)$$

since  $\frac{p}{p-1} = \frac{N}{2}$ .

Therefore, by (3.3) and (3.4) for a sufficiently large  $R > 1$  we have

$$\begin{aligned} \int_{\Omega^c} |\varphi_2(x)| dx &= \int_{\Omega^c} \left( \frac{N-2+\alpha}{\alpha} - |x|^{2-N} \right) \Psi^k \left( \frac{\ln\left(\frac{|x|}{\sqrt{R}}\right)}{\ln(\sqrt{R})} \right) dx \\ &\stackrel{|x|=r}{\leq} \int_{1 < r < R} \left( \frac{N-2+\alpha}{\alpha} - r^{2-N} \right) r^{N-1} dr \\ &\leq \left( \frac{N-2+\alpha}{\alpha} \right) \int_{1 < r < R} r^{N-1} dr \\ &= \left( \frac{N-2+\alpha}{\alpha N} \right) R^N - \left( \frac{N-2+\alpha}{\alpha N} \right) \\ &\leq CR^N. \end{aligned} \quad (3.11)$$

From the combination of (3.10) and (3.11) we get (3.7).

Similarly, we arrive at

$$\mathcal{I}_2 = \left( \int_0^T \varphi_1^{-\frac{1}{p-1}}(t) |\varphi_1''(t)|^{\frac{p}{p-1}} dt \right) \left( \int_{\Omega^c} |\varphi_2(x)| dx \right).$$

Using (3.2) with  $l > \frac{2p}{p-1}$  we get

$$\begin{aligned} \int_0^T \varphi_1^{-\frac{1}{p-1}}(t) |\varphi_1''(t)|^{\frac{p}{p-1}} dt &= \int_0^T \left(1 - \frac{t}{T}\right)^{-\frac{l}{p-1}} \left| l(l-1)T^{-2} \left(1 - \frac{t}{T}\right)^{l-2} \right|^{\frac{p}{p-1}} dt \\ &= \frac{(p-1)(l(l-1))^{\frac{p}{p-1}}}{l(p-1)-p-1} T^{1-\frac{2p}{p-1}} \\ &= CT^{1-N}, \end{aligned} \quad (3.12)$$

here we have used  $\frac{2p}{p-1} = N$ . Combining (3.11) and (3.12) it follows (3.8).

Next, let us calculate the next integral

$$\mathcal{I}_3 = \left( \int_0^T |\varphi_1(t)| dt \right) \left( \int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}}(x) |\Delta \varphi_2(x)|^{\frac{p}{p-1}} dx \right).$$

From (3.2), it is easy to verify by a direct calculation that

$$\int_0^T |\varphi_1| dt = \int_0^T \left(1 - \frac{t}{T}\right)^l dt = \frac{1}{l+1} T. \quad (3.13)$$

Since, the function  $\xi(x)$  is a radial, we obtain

$$|\Delta\xi(r)| \leq C \left[ \frac{1}{r^2 \ln^2 \sqrt{R}} \Psi^{k-2} \left( \frac{\ln \left( \frac{r}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right) + \frac{1}{r^2 \ln \sqrt{R}} \Psi^{k-1} \left( \frac{\ln \left( \frac{r}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right) \right], \quad (3.14)$$

where  $r = |x| = (x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}$  and  $C > 0$  is an arbitrary constant.

Therefore, taking into account the function  $H(x)$  is harmonic and remaining (3.14), we arrive at

$$\begin{aligned} |\Delta\varphi_2(x)| &= |\Delta [H(x)\xi(x)]| \\ &\leq H(x)|\Delta [\xi(x)]| + 2|\nabla H(x)||\nabla \xi(x)| \\ &\leq CH(x) \left[ \frac{1}{|x|^2 \ln^2 \sqrt{R}} \Psi^{k-2} \left( \frac{\ln \left( \frac{|x|}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right) + \frac{1}{|x|^2 \ln \sqrt{R}} \Psi^{k-1} \left( \frac{\ln \left( \frac{|x|}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right) \right] \\ &\quad + \frac{2k(N-2)}{|x|^2 \ln \sqrt{R}} |x|^{2-N} \Psi^{k-1} \left( \frac{\ln \left( \frac{|x|}{\sqrt{R}} \right)}{\ln \left( \sqrt{R} \right)} \right) \\ &\leq CH(x) \left( \frac{1}{|x|^2 \ln^2 \sqrt{R}} \xi^{\frac{k-2}{k}}(x) + \frac{1}{|x|^2 \ln \sqrt{R}} \xi^{\frac{k-1}{k}}(x) \right), \end{aligned} \quad (3.15)$$

thanks to  $|x|^{2-N} \leq \alpha H(x)$ .

Consequently, we get

$$\begin{aligned} &\int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}}(x) |\Delta\varphi_2(x)|^{\frac{p}{p-1}} dx \\ &\leq C \int_{\Omega^c} |H(x)\xi(x)|^{-\frac{1}{p-1}} \left| H(x) \left[ \frac{1}{|x|^2 \ln^2 \sqrt{R}} \xi^{\frac{k-2}{k}}(x) + \frac{1}{|x|^2 \ln \sqrt{R}} \xi^{\frac{k-1}{k}}(x) \right] \right|^{\frac{p}{p-1}} dx. \end{aligned}$$

Using Schwarz's inequality and the following inequality

$$(a+b)^m \leq 2^{m-1}(a^m + b^m), \quad a \geq 0, b \geq 0, m = \frac{p}{p-1},$$

we obtain

$$\begin{aligned} \int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}}(x) |\Delta\varphi_2(x)|^{\frac{p}{p-1}} dx &\leq C \int_{\Omega^c} H(x) |\xi(x)|^{-\frac{1}{p-1}} \left[ \frac{1}{|x|^2 \ln^2 \sqrt{R}} \left| \xi^{\frac{k-2}{k}}(x) \right|^{\frac{p}{p-1}} \right. \\ &\quad \left. + C \int_{\Omega^c} H(x) |\xi(x)|^{-\frac{1}{p-1}} \left[ \frac{1}{|x|^2 \ln \sqrt{R}} \left| \xi^{\frac{k-1}{k}}(x) \right|^{\frac{p}{p-1}} \right] dx. \right. \end{aligned}$$

Therefore, noting that  $k > \frac{2p}{p-1}$  and (3.4) we arrive at

$$\begin{aligned} \int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}}(x) |\Delta\varphi_2(x)|^{\frac{p}{p-1}} dx &\leq C \int_{\sqrt{R} < |x| < R} H(x) \left[ \frac{1}{|x|^2 \ln^2 \sqrt{R}} \right]^{\frac{p}{p-1}} dx \\ &\quad + C \int_{\sqrt{R} < |x| < R} H(x) \left[ \frac{1}{|x|^2 \ln \sqrt{R}} \right]^{\frac{p}{p-1}} dx. \end{aligned}$$

At this stage, recalling  $p = \frac{N}{N-2}$ , we calculate the right-hand side of the last estimate separately

$$\begin{aligned} &\int_{\sqrt{R} < |x| < R} H(x) \left[ \frac{1}{|x|^2 \ln^2 \sqrt{R}} \right]^{\frac{p}{p-1}} dx \stackrel{|x|=r}{=} \left[ \frac{1}{\ln^2 \sqrt{R}} \right]^{\frac{N}{2}} \int_{\sqrt{R} < r < R} \left( \frac{N-2+\alpha}{\alpha} - r^{2-N} \right) r^{-1} dr \\ &= \left[ \frac{1}{\ln^2 \sqrt{R}} \right]^{\frac{N}{2}} \int_{\sqrt{R} < r < R} \left( \frac{N-2+\alpha}{\alpha} r^{-1} - r^{1-N} \right) dr \\ &\leq C (\ln R)^{1-N} \end{aligned} \quad (3.16)$$

and

$$\int_{\sqrt{R} < |x| < R} H(x) \left[ \frac{k(N-2)}{|x|^2 \ln \sqrt{R}} \right]^{\frac{p}{p-1}} dx \leq C (\ln R)^{-\frac{N}{2}+1}. \quad (3.17)$$

Consequently, due to the last inequalities, we obtain

$$\int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}}(x) |\Delta \varphi_2(x)|^{\frac{p}{p-1}} dx \leq C \left( (\ln R)^{1-N} + (\ln R)^{1-\frac{N}{2}} \right). \quad (3.18)$$

Therefore, combining (3.13) and (3.18) we get (3.9), which completes the proof.  $\square$

Next, we will introduce the test function in the following form

$$\psi = \psi_1(t)\psi_2(x) = \left(1 - \frac{t}{T}\right)^l H(x)\Psi\left(\frac{|x|}{R}\right), \quad l > \frac{2p}{p-1}, \quad (3.19)$$

where  $T, R > 0$  and  $H(x)$  is defined by (3.5).

The function  $\Psi \in C^2(\mathbb{R}_+)$  is the standard cut-off function given by

$$\Psi\left(\frac{|x|}{R}\right) = \begin{cases} 1 & \text{if } 0 \leq |x| \leq R, \\ \searrow & \text{if } R < |x| < 2R, \\ 0 & \text{if } 2R \leq |x|. \end{cases} \quad (3.20)$$

**Corollary 3.4.** *Let  $N \geq 3$  and  $p = \frac{\lambda-2}{\lambda}$ . Then for sufficiently large  $T, R$  there hold true*

$$\mathcal{J}_1 = \int_Q \psi^{-\frac{1}{p-1}} |\psi_t|^{\frac{p}{p-1}} dx dt \leq CT^{\frac{\lambda}{2}} R^N, \quad (3.21)$$

$$\mathcal{J}_2 = \int_Q \psi^{-\frac{1}{p-1}} |\psi_{tt}|^{\frac{p}{p-1}} dx dt \leq CT^{\lambda-1} R^N \quad (3.22)$$

and

$$\mathcal{J}_3 = \int_Q \psi^{-\frac{1}{p-1}} |\Delta \psi|^{\frac{p}{p-1}} dx dt \leq CTR^{N+\lambda-2}, \quad (3.23)$$

where  $C$  are positive constants independent of  $T$  and  $R$ .

*Proof of Corollary 3.4.* According to the test function  $\psi = \psi_1(t)\psi_2(x)$ , we have

$$\mathcal{J}_1 = \left( \int_0^T \psi_1^{-\frac{1}{p-1}}(t) |\psi_1'(t)|^{\frac{p}{p-1}} dt \right) \left( \int_{\Omega^c} |\psi_2(x)| dx \right)$$

and

$$\mathcal{J}_2 = \left( \int_0^T \psi_1^{-\frac{1}{p-1}}(t) |\psi_1''(t)|^{\frac{p}{p-1}} dt \right) \left( \int_{\Omega^c} |\psi_2(x)| dx \right).$$

Using (3.10) and (3.12) to the first part of the last integrals with  $\frac{p}{p-1} = -\frac{\lambda-2}{2}$  we obtain

$$\int_0^T \psi_1^{-\frac{1}{p-1}}(t) |\psi_1'(t)|^{\frac{p}{p-1}} dt = CT^{\frac{\lambda}{2}}, \quad (3.24)$$

$$\int_0^T \psi_1^{-\frac{1}{p-1}}(t) |\psi_1''(t)|^{\frac{p}{p-1}} dt = CT^{\lambda-1}. \quad (3.25)$$

In addition, we have

$$\begin{aligned} \int_{\Omega^c} |\psi_2(x)| dx &= \int_{\Omega^c} \left( \frac{N-2+\alpha}{\alpha} - |x|^{2-N} \right) \Psi\left(\frac{|x|}{R}\right) dx \\ &\leq \int_{1 < r < 2} \left( \frac{N-2+\alpha}{\alpha} - r^{2-N} \right) r^{N-1} dr \\ &\leq \left( \frac{N-2+\alpha}{\alpha} \right) \int_{1 < r < 2} r^{N-1} dr \\ &\leq CR^N. \end{aligned}$$

From the combination of (3.24) and (3.25) with (3.12) we get the estimates for  $\mathcal{J}_1, \mathcal{J}_2$ , respectively. Next, we consider the integral  $\mathcal{J}_3$ . In view of (3.16) and (3.17) with  $\frac{p}{p-1} = -\frac{\lambda-2}{2}$  it follows that

$$\begin{aligned} \int_{\Omega^c} \psi_2^{-\frac{1}{p-1}} |\Delta\varphi_2|^{\frac{p}{p-1}} dx &= \int_{R < |x| < 2R} \Psi^{-\frac{1}{p-1}} \left( \frac{|x|}{R} \right) \left| \Delta\Psi \left( \frac{|x|}{R} \right) \right|^{\frac{p}{p-1}} dx \\ &= R^{-\frac{2p}{p-1}} \int_{R < |x| < 2R} \Psi^{-\frac{1}{p-1}} \left( \frac{|x|}{R} \right) \left| \Psi'' \left( \frac{|x|}{R} \right) \right|^{\frac{p}{p-1}} dx \\ &\stackrel{|x|=yR}{=} R^{-\frac{2p}{p-1}+N} \int_{1 < |y| < 2} \Psi^{-\frac{1}{p-1}}(|y|) |\Psi''(|y|)|^{\frac{p}{p-1}} dy \\ &\leq CR^{-\frac{2p}{p-1}+N} \\ &= CR^{N+\lambda-2}. \end{aligned}$$

Combining the expression (3.13) with the last estimates, we get (3.23).  $\square$

#### 4. PROOF OF BASIC THEOREMS

In this subsection we will prove the main theorems in detail.

*Proof of Theorem 2.5. (i)* We argue by contradiction by supposing that a global weak solution  $u \in L^p_{\text{loc}}(\overline{\Omega^c})$  to problem (1.1). From Definition 2.1 it yields

$$\int_{\Omega^c} |u|^p \varphi_2 dx + \int_{\Gamma} f \varphi_2 d\sigma \leq \int_{\Omega^c} |u| |\Delta\varphi_2| dx.$$

Hence, using Hölder's and the  $\varepsilon$ -Young inequality with  $\varepsilon = p$ , we arrive at

$$\begin{aligned} \int_{\Omega^c} |u| |\Delta\varphi_2| dx &\leq \left( \int_{\Omega^c} |u|^p \varphi_2 dx \right)^{\frac{1}{p}} \left( \int_{\Omega^c} |u| |\Delta\varphi_2| dx \right)^{\frac{p-1}{p}}. \\ &\leq \int_{\Omega^c} |u|^p \varphi_2 dx + (p-1)p^{-\frac{p}{p-1}} \int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}} |\Delta\varphi_2|^{\frac{p}{p-1}} dx. \end{aligned}$$

From the last inequality, we obtain

$$\int_{\Gamma} f \varphi_2 d\sigma \leq C \int_{\Omega^c} \varphi_2^{-\frac{1}{p-1}} |\Delta\varphi_2|^{\frac{p}{p-1}} dx.$$

In view of (3.18) with  $R \rightarrow \infty$ , we get the contradiction

$$\int_{\partial\Omega} f(x) d\sigma > 0.$$

**(ii)** The proof is done by contradiction. Assume that there exists a global in time weak solution  $u \in L^p_{\text{loc}}([0, \infty) \times \overline{\Omega^c})$  of the problem (1.2). In view of Definition 2.2, we have

$$\int_Q |u|^p \varphi dx dt + \int_{\Omega^c} u_0(x) \varphi(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt \leq \int_Q |u| |\varphi_t| dx dt + \int_Q |u| |\Delta\varphi| dx dt. \quad (4.1)$$

Therefore, by Hölder's inequality, we obtain

$$\int_Q |u| |\varphi_t| dx dt \leq \left( \int_Q |u|^p \varphi dx dt \right)^{\frac{1}{p}} \underbrace{\left( \int_Q \varphi^{-\frac{1}{p-1}} |\varphi_t|^{\frac{p}{p-1}} dx dt \right)^{\frac{p-1}{p}}}_{\mathcal{I}_1}$$

and

$$\int_Q |u| |\Delta\varphi| dx dt \leq \left( \int_Q |u|^p \varphi dx dt \right)^{\frac{1}{p}} \underbrace{\left( \int_Q \varphi^{-\frac{1}{p-1}} |\Delta\varphi|^{\frac{p}{p-1}} dx dt \right)^{\frac{p-1}{p}}}_{\mathcal{I}_3}.$$

Using the  $\varepsilon$ -Young inequality with  $\varepsilon = \frac{p}{2}$  in the last inequalities, it follows that

$$\int_Q |u| |\varphi_t| dxdt \leq \frac{1}{2} \int_Q |u|^p \varphi dxdt + \underbrace{\frac{p-1}{p} \left(\frac{p}{2}\right)^{-\frac{1}{p-1}} \int_Q \varphi^{-\frac{1}{p-1}} |\varphi_t|^{\frac{p}{p-1}} dxdt}_{\mathcal{I}_1}.$$

Similarly, one obtains

$$\int_Q |u| |\Delta \varphi_t| dxdt \leq \frac{1}{2} \int_Q |u|^p \varphi dxdt + \underbrace{\frac{p-1}{p} \left(\frac{p}{2}\right)^{-\frac{1}{p-1}} \int_Q \varphi^{-\frac{1}{p-1}} |\Delta \varphi|^{\frac{p}{p-1}} dxdt}_{\mathcal{I}_3}.$$

Consequently, we can rewrite (4.1) as

$$\int_{\Omega^c} u_0(x) \varphi(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt \leq C(p) (\mathcal{I}_1 + \mathcal{I}_3), \quad (4.2)$$

where  $C(p) = \frac{p-1}{p} \left(\frac{p}{2}\right)^{-\frac{1}{p-1}}$ .

Then, from Lemma 3.2 and Lemma 3.3, for  $T = R^j$ ,  $j > 0$ , we get

$$\begin{aligned} \int_{\partial\Omega} f \xi(x) d\sigma &\leq CR^{-j} \int_{\Omega^c} |u_0(x)| \varphi(0, x) dx \\ &\quad + C(p) \left( R^{N(-\frac{j}{2}+1)} + (\ln R)^{-N+1} + (\ln R)^{-\frac{N}{2}+1} \right), \end{aligned}$$

where  $C > 0$  is an arbitrary constant.

Since

$$\begin{aligned} \lim_{R \rightarrow \infty} H(x) \xi(x) &= \frac{N-2}{\alpha} \lim_{R \rightarrow \infty} \Psi^k \left( \frac{\ln \left( \frac{|x|}{\sqrt{R}} \right)}{\ln(\sqrt{R})} \right) \\ &= \frac{N-2}{\alpha} \Psi^k(-1) \\ &= \frac{N-2}{\alpha}, \quad x \in \partial\Omega, \end{aligned}$$

taking  $j > 2$  and passing to the limit as  $R \rightarrow \infty$  in the above inequality one can obtains

$$\lim_{R \rightarrow \infty} \int_{\partial\Omega} f \xi(x) d\sigma = \int_{\partial\Omega} f d\sigma \leq 0, \quad (4.3)$$

which is a contradiction with

$$\int_{\partial\Omega} f d\sigma > 0.$$

(iii) At this stage, following the same technique as used in the proof of the previous case, we deduce that

$$\int_{\Omega^c} u_1(x) \varphi(0, x) dx - \int_{\Omega^c} u_0(x) \varphi_t(0, x) dx + \int_{\Gamma} f \varphi d\sigma dt \leq C(p) (\mathcal{I}_2 + \mathcal{I}_3). \quad (4.4)$$

Using Lemma 3.2 and Lemma 3.3, for  $T = R^j$ ,  $j > 0$ , we obtain

$$\begin{aligned} \int_{\partial\Omega} f \xi(x) d\sigma &\leq CR^{-j} \int_{\Omega^c} |u_1(x)| \varphi(0, x) dx + CR^{-j} \int_{\Omega^c} |u_0(x)| \varphi_t(0, x) dx \\ &\quad + C(p) \left( R^{N(-j+1)} + (\ln R)^{-N+1} + (\ln R)^{-\frac{N}{2}+1} \right). \end{aligned}$$

Finally, taking  $j > 1$  and passing to the limit  $R \rightarrow \infty$  and noting (4.3), we get a contradiction with  $\int_{\partial\Omega} f d\sigma > 0$ .

(iv) Next, acting in the same way as in the above case, we get the following estimate

$$\begin{aligned} \int_{\Omega^c} (u_0(x) + u_1(x))\varphi(0, x)dx - \int_{\Omega^c} u_0(x)\varphi_t(0, x)dx + \int_{\Gamma} f\varphi d\sigma dt \\ \leq C(p)(\mathcal{I}_1 + \mathcal{I}_2 + \mathcal{I}_3), \end{aligned}$$

where  $C(p) = \frac{p-1}{p} \left(\frac{p}{3}\right)^{-\frac{1}{p-1}}$ .

From the results of Lemma 3.2 and Lemma 3.3 with changing  $T = R^j$ ,  $j > 0$ , we arrive at

$$\begin{aligned} \int_{\partial\Omega} f\xi(x)d\sigma \leq CR^{-j} \int_{\Omega^c} (|u_0(x)| + |u_1(x)|)\varphi(0, x)dx + CR^{-j} \int_{\Omega^c} |u_0(x)|\varphi_t(0, x)dx \\ + C(p) \left( R^{N(-\frac{j}{2}+1)} + R^{N(-j+1)} + (\ln R)^{-N+1} + (\ln R)^{-\frac{N}{2}+1} \right). \end{aligned}$$

Hence, taking  $j > 2$  and passing to the limit  $R \rightarrow \infty$  in the last inequality we get a contradiction with

$$\int_{\partial\Omega} f d\sigma > 0,$$

which completes the proof.  $\square$

*Proof of Theorem 2.7. (i)* The proof also will be done by contradiction. Suppose that  $u \in L_{\text{loc}}^p([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.2).

Therefore, from Definition 2.2 and using Hölder's,  $\varepsilon$ -Young's inequality with fact that  $f \geq 0$ , we obtain instead of the estimate (4.2)

$$\int_{\Omega^c} u_0(x)\psi(0, x)dx \leq C(p) \left( \int_Q \psi^{-\frac{1}{p-1}} |\psi_t|^{\frac{p}{p-1}} dxdt + \int_Q \psi^{-\frac{1}{p-1}} |\Delta\psi|^{\frac{p}{p-1}} dxdt \right),$$

where  $C(p) = \frac{p-1}{p} \left(\frac{p}{2}\right)^{-\frac{1}{p-1}}$ .

Hence, in view of  $p = \frac{\lambda-2}{\lambda}$  from Corollary 3.4, one obtains

$$\begin{aligned} \int_{\Omega^c} u_0(x)\psi(0, x)dx \leq C(\lambda)(\mathcal{J}_1 + \mathcal{J}_3) \\ \leq C(\lambda) \left( T^{\frac{\lambda}{2}} R^N + TR^{N+\lambda-2} \right), \end{aligned} \quad (4.5)$$

here  $C(\lambda) = \frac{2}{2-\lambda} \left(\frac{\lambda-2}{2\lambda}\right)^{\frac{\lambda}{2}}$  is a positive constant.

At this stage, recalling (3.19) with (3.20), we get

$$\begin{aligned} \int_{\Omega^c} u_0(x)\psi(0, x)dx &= \int_{\Omega^c} u_0(x) \left( \frac{N-2+\alpha}{\alpha} - |x|^{2-N} \right) \Psi \left( \frac{|x|}{R} \right) dx \\ &\geq \frac{A}{\alpha} \int_{R^{\frac{\lambda}{2}}}^R |x|^\lambda dx \\ &\geq \frac{A}{\alpha} R^{\frac{\lambda+N}{2}} > 0. \end{aligned} \quad (4.6)$$

Next, using the last estimate and changing the variable  $T = R^j$ , we can rewrite (4.5) in the following form

$$\begin{aligned} 0 < A \leq \alpha C(\lambda) R^{-\frac{\lambda+N}{2}} \left( R^{\frac{j\lambda}{2}} R^N + R^j R^{N+\lambda-2} \right) \\ = \alpha C(\lambda) \left( R^{\frac{j\lambda-\lambda+N}{2}} + R^{\frac{2j+\lambda+N-4}{2}} \right), \end{aligned} \quad (4.7)$$

where  $C(\lambda) > 0$  is a positive constant independent of  $R$ .

Let us assume that

$$\begin{cases} \lambda < 0, & \text{if } N = 3, 4, \\ \lambda < 4 - N, & \text{if } N \geq 5. \end{cases}$$

Then, choosing

$$0 < j < \min \left\{ 1 - \frac{N}{\lambda}, \frac{4 - N - \lambda}{2} \right\}$$

we make sure that

$$\frac{j\lambda - \lambda + N}{2} < 0 \quad \text{and} \quad \frac{2j + \lambda + N - 4}{2} < 0.$$

Note that since

$$1 - \frac{N}{\lambda} > 0 \quad \text{and} \quad \frac{4 - N - \lambda}{2} > 0,$$

the set  $\left(0, \min \left\{ 1 - \frac{N}{\lambda}, \frac{4 - N - \lambda}{2} \right\}\right)$  is not empty.

Hence, passing to the limit  $R \rightarrow \infty$  in (4.7) we get a contradiction with  $A > 0$ .

(ii) As previously, we argue by contradiction. Assume that  $u \in L^p_{\text{loc}}([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.3). Following a similar argument as that used in the proof of part (i), we obtain

$$\begin{aligned} \int_{\Omega^c} u_1(x)\psi(0, x)dx - \int_{\Omega^c} u_0(x)\psi_t(0, x)dx &\leq C(\lambda)(\mathcal{J}_2 + \mathcal{J}_3) \\ &\leq C(\lambda)(T^{\lambda-1}R^N + TR^{N+\lambda-2}). \end{aligned}$$

Next, from the elementary calculation

$$- \int_{\Omega^c} u_0(x)\psi_t(0, x)dx = CT^{-1} \int_{\Omega^c} u_0(x)\psi(0, x)dx, \quad (4.8)$$

we get

$$\int_{\Omega^c} u_0(x)\psi(0, x)dx \leq C(\lambda)(T^\lambda R^N + T^2 R^{N+\lambda-2}) - T \int_{\Omega^c} u_1(x)\psi(0, x)dx.$$

Using (4.6)

$$0 < \frac{A}{\alpha} R^{\frac{\lambda+N}{2}} \leq C(\lambda)(T^\lambda R^N + T^2 R^{N+\lambda-2}) - T \int_{\Omega^c} u_1(x)\psi_2(x)dx$$

and changing  $T = R^j$ ,  $j > 0$ , we deduce that

$$0 < A \leq \alpha C(\lambda) R^{-\frac{\lambda+N}{2}} (R^{j\lambda+N} + R^{2j+N+\lambda-2}) - \alpha R^j \int_{\Omega^c} u_1(x)\psi_2(x)dx,$$

which is

$$0 < A \leq \alpha C(\lambda) \left( R^{\frac{2j\lambda-\lambda+N}{2}} + R^{\frac{4j+\lambda+N-4}{2}} \right) - \alpha R^{\frac{2j-\lambda-N}{2}} \int_{\Omega^c} u_1(x)\psi_2(x)dx, \quad (4.9)$$

where  $C(\lambda) > 0$  is a positive constant independent of  $R$ .

Let us assume that

$$\begin{cases} \lambda < 0, & \text{if } N = 3, 4, \\ \lambda < 4 - N, & \text{if } N \geq 5. \end{cases}$$

Choosing

$$0 < j < \min \left\{ \frac{\lambda - N}{2\lambda}, \frac{4 - N - \lambda}{4}, \frac{\lambda + N}{2} \right\}$$

we make sure that

$$\frac{2j - \lambda - N}{2} < 0, \quad \frac{2j\lambda - \lambda + N}{2} < 0 \quad \text{and} \quad \frac{4j + \lambda + N - 4}{2} < 0.$$

Due to the fact that

$$\frac{\lambda + N}{2} > 0, \quad \frac{\lambda - N}{2\lambda} > 0 \quad \text{and} \quad \frac{4 - N - \lambda}{4} > 0,$$

the set  $\left(0, \min\left\{\frac{\lambda-N}{2\lambda}, \frac{4-N-\lambda}{4}, \frac{\lambda+N}{2}\right\}\right)$  is not empty.

Finally, passing to the limit  $R \rightarrow \infty$  in (4.9) we get a contradiction with  $A > 0$ .

(iii) Suppose that  $u \in L^p_{\text{loc}}([0, \infty) \times \overline{\Omega^c})$  is a global weak solution to (1.2). Continuing exactly as in the proof part (i), we arrive at

$$\int_{\Omega^c} (u_0(x) + u_1(x))\psi(0, x)dx - \int_{\Omega^c} u_0(x)\psi_t(0, x)dx \leq C(\lambda)(\mathcal{J}_1 + \mathcal{J}_2 + \mathcal{J}_3).$$

From (4.8), it follows that

$$\int_{\Omega^c} (u_0(x) + u_1(x))\psi(0, x)dx + CT^{-1} \int_{\Omega^c} u_0(x)\psi(0, x)dx \leq C(\lambda)(\mathcal{J}_1 + \mathcal{J}_2 + \mathcal{J}_3).$$

Therefore, in view of (4.6) and Corollary 3.4, we have

$$\begin{aligned} \left(1 + \frac{1}{T}\right) \frac{A}{\alpha} R^{\frac{\lambda+N}{2}} &\leq C(\lambda) \left(T^{\frac{\lambda}{2}} R^N + T^{\lambda-1} R^N + TR^{N+\lambda-2}\right) \\ &\quad - \int_{\Omega^c} u_1(x)\psi_2(x)dx. \end{aligned}$$

At this stage, using and changing the variable  $T = R^j$  in the last inequality, we obtain

$$\begin{aligned} \left(1 + \frac{1}{R^j}\right) A &\leq \alpha C(\lambda) R^{-\frac{\lambda+N}{2}} \left(R^{\frac{\lambda}{2}j+N} + R^{(\lambda-1)j+N} + R^{j+N+\lambda-2}\right) \\ &\quad - \alpha R^{-\frac{\lambda+N}{2}} \int_{\Omega^c} u_1(x)\psi_2(x)dx. \end{aligned}$$

After doing some elementary calculations, we arrive at

$$\begin{aligned} 0 < A &\leq \alpha C(\lambda) \left(R^{\frac{\lambda j - \lambda + N}{2}} + R^{\frac{2(\lambda-1)j - \lambda + N}{2}} + R^{\frac{2j + \lambda + N - 4}{2}}\right) \\ &\quad - \alpha R^{-\frac{\lambda+N}{2}} \int_{\Omega^c} u_1(x)\psi_2(x)dx, \end{aligned} \tag{4.10}$$

where  $C(\lambda) > 0$  is a positive constant independent of  $R$ .

Suppose that

$$\begin{cases} \lambda < 0, & \text{if } N = 3, 4, \\ \lambda < 4 - N, & \text{if } N \geq 5. \end{cases}$$

Then, choosing

$$0 < j < \min\left\{\frac{\lambda - N}{\lambda}, \frac{\lambda - N}{2(\lambda - 1)}, \frac{4 - N - \lambda}{2}\right\}$$

we verify that

$$\frac{\lambda j - \lambda + N}{2} < 0, \quad \frac{2(\lambda - 1)j - \lambda + N}{2} < 0 \quad \text{and} \quad \frac{2j + \lambda + N - 4}{2} < 0.$$

Since

$$\frac{\lambda - N}{\lambda} > 0, \quad \frac{\lambda - N}{2(\lambda - 1)} > 0 \quad \text{and} \quad \frac{4 - N - \lambda}{2} > 0,$$

the set  $\left(0, \min\left\{\frac{\lambda-N}{\lambda}, \frac{\lambda-N}{2(\lambda-1)}, \frac{4-N-\lambda}{2}\right\}\right)$  is also not empty.

Therefore, passing to the limit as  $R \rightarrow +\infty$  in (4.10), a contradiction follows  $A > 0$ , which completes the proof.  $\square$

#### DECLARATION OF COMPETING INTEREST

The authors declare that there is no conflict of interest.

#### DATA AVAILABILITY STATEMENTS

The manuscript has no associated data.

## ACKNOWLEDGMENTS

This research has been funded by the Science Committee of the Ministry of Education and Science of the Republic of Kazakhstan (Grant No. AP09259578). Berikbol Torebek is also supported by the FWO Odysseus 1 grant G.0H94.18N: Analysis and Partial Differential Equations and by the Methusalem programme of the Ghent University Special Research Fund (BOF) (Grant number 01M01021).
